THE GARDENS AT THE HOLME, INNER CIRCLE, REGENT'S PARK.

IN the heart of London there are no gardens so attractive as those at The Holme, one of the delightful houses in the Inner Circle of Regent's Park, of which the public knows little. Their seclusion is undisturbed, and until the advent of the Great Central Railway they had a unique distinction. "I believe," said Mr. Campbell Newington, when I asked him about visiting his garden, "that The Holme was the only place in the world where one could hear the lion roar and the nightingale sing." The increase of smoke which followed the running of the Great Central trains drove away the nightingales. Other songsters of the air have almost entirely disappeared since the American squirrels have been introduced in the Zoological Gardens; but the flight of the blackbird and the thrush has not diminished the charms of the place from a purely horticultural point of view. The Holme is Crown property, and as Mr. Campbell Newington has just disposed of the remainder of his lease, which has been held for more than half a century by his wife's family, I hastened to take advantage of his permission to visit and describe the gardens. He still regards them as the most beautiful spot in London in spring and summer, but he has lately decided to reside entirely on his fine estate in Sussex. His departure also marks that of his head gardener, Mr. Thomas Abbott, whose successes as an exhibitor have won him a well-deserved reputation. Mr. Abbott accompanies his employer to Oakover, where he will enjoy ample opportunities for the exercise of his capacities. He appreciates the prospect, but confesses that he deeply regrets leaving The Holme, where during upwards of thirteen years he has had charge of the gardens, and to which he has become greatly attached.

"I am glad," he said, "that you have come to look round the gardens, because, though there is not much to see in mid-September, with all plants and vegetation dried up, and even the leaves falling fast, you can judge what they were like earlier in the year. I go at the end of the month to Oakover.

"We may as well start," he continued, "where we are, noting the pleasant little pavilion facing the tennis-court, with the major variety of Virginian Creeper covering it."

"I should like to know the chief contents of the long border running round."

"Several varieties of Geum do well, and among other flowering plants which find the soil and position congenial are Iris siberica, Pentstemon Rosy Gem, numerous varieties of Aquilegias, and Lupin Moerheimi. Thalictrum purpureum grows six feet high, and Spiræa aruncus upwards of six feet, some being five feet through."

The Glen.

With a peep at the water from the pretty summer-house, covered with zinc, we next made our way to the lovely glen. Here, a picturesque archway, resembling an ancient ruin, heightens the effect of a glorious display of Bracken Ferns; and a venerable Scotch Fir is a conspicuous feature.

"In the spring," said Mr. Abbott, "before the Ferns come on, the ground is covered with white Scillas and Bluebells, while the banks are brightened with Crocuses and Narcissi. The glen was made ninety years ago. The trees include the single and double Thorns (some of the flowers being the size of a halfpenny). Limes, Planes, Chestnuts, and Sumach also flourish."

A Rose to Grow in London.

"I see that you have varieties of the rugosa Rose."

"They are all Japanese, and give masses of bloom, with the most delicious scent. The birds love the berries. A double white variety does especially well. The rugosas may be

MR. THOMAS ABBOTT.

recommended for London gardens. We find, too, that Lilacs thrive."

"And Delphiniums?" I asked, observing a fine collection in a modest corner.

"Yes, particularly King of Delphiniums and Bella Donna. Azaleas likewise are very happy here. A portion of the bedding is on the lower end of the lawn, in front of the lake. As to the bedding close to the water, there are, as you see, two beds of Antirrhinum Rose Queen, with a groundwork of Geranium Olive Carr, edged by London Pride. We grow the Antirrhinums from our own cuttings, of which I take a thousand."

"Where do you keep them in the winter?"

"In a cold pit, and plant out early in April. They are in flower from May to October."

"How are the other beds made up?"

Zeas for Bedding.

"In summer two are filled with Zea variegata (green, yellow, red, and pink), a groundwork of Violas planted out very early, and an edging of Euonymus radicans variegata. The Zeas are planted out in June, and grown previously in large pots. These beds in spring are all thickly planted with May-flowering and Darwin Tulips."

"The Delphiniums at the back help to make one of your corners showy."

"Yes, with a combination of white Marguerites, dark-leaved Perillas, and an edging of Geraniums Harry Hieover. One bed is devoted entirely to Funkias, valuable not only for their dark purple flowers, but also for their handsome foliage.

"You fill up all the borders under the shrubs?"

"Lilium gigantea is used largely for this purpose, and after the Ghent Azaleas have flowered, Geraniums come into bloom. We get a show of flowers all through the summer in all parts of the lawn."

"When were the Rhododendrons planted?"

"Some of them only four or five years ago; others twenty. At the back there are several ponticums, but the named varieties in front include W. J. Waterer, Pink Perfection, and Scarlet King. We put peat and leaf-mould in the soil, and water very much."

Coleus for Edging.

"You have a fine show of Coleus as an edging round the outside of the conservatory."

"The variety is Lady Falmouth, and in the borders are Geraniums Hermione and Leopard. There are also some plants of Ricinus Gibsonii. The conservatory faces due south, which suits the Coleus."

"The conservatory impresses me as particularly handsome."

"You will notice that there is no woodwork in it. Just now one of the features are the baskets of Ferns, Nephrolepis exaltata and Asparagus Sprengeri. On the wall are Camellias which were planted twenty years ago, and from which we get a wealth of flower. In the summer one of the features is the display of Dendrobium Wardianum hanging down like tails. Everything on the floor is in pots. We begin with bulbs in spring, and these are quickly followed by huge specimens of Azaleas, some of them thirty years old, mop-headed, and four to five feet through. We have never had a failure with these Azaleas, which are every year full of bloom. Rhododendron Pink Pearl comes in next, and after these Pelargoniums in variety, with Hydrangea hortensis, paniculata, and niger (the black stem). Acer negundo variegata is also used, and the year closes with Chrysanthemums and Poinsettias."

Violas for Town Gardens.

From the conservatory we strolled to the kitchen garden, first of all inspecting the beds in which certain plants are grown for trial.

"One of our features," said Mr. Abbott, "is the Lily of the Valley, of which we had nearly twenty thousand last season. The plants occupy the ground from four to six years, and are then transplanted. Those of four years' growth bear the best flowers, and I have had seventeen bells on a single spike. We top-dress them in winter with good, decayed manure, giving it whenever they want it. In the plot next to the Lilies we grow one thousand Violas, Mrs. Chichester (pale blue), Marchioness (very pale blue), Blue Cloud, Bute Yellow, and Willie Farmer (pale mauve). Mrs. J. J. Whiteleg (yellow), is a Viola of very strong habit, but Blue Cloud is the Viola that stands the smoke and fog of London best. In another plot are the spurred varieties of Aquilegias. They are grown two years before they are allowed to bloom, and by this process we get very fine plants the third year, with five to six spikes of flower."

"Have you many varieties in your plot of Border Carnations?"

"We layer about two hundred Old Clove, and the other varieties are White Countess and Dwarf Vienna. The latter is one of the best varieties for cutting, and lasts for several years."

The Six Best Sweet Peas.

"Do you go in for a number of varieties of Sweet Peas?"

"No, we do not exceed eight, of which the six best are Red Dragon, King Edward VII. Spencer, Etta Dyke, Earl Spencer, and Miss

Digitized by Google Original from CORNELL UNIVERSITY

Willmott. Some of the Sweet Peas this year were eight feet high, with stems seventeen inches long, but the ground was trenched three feet deep and manured right to the bottom trench."

"You have also a long herbaceous border in the kitchen garden."

"Which has the double advantage of facing

THE HOLME, REGENT'S PARK.

(Photo. by The Topical Press Agency, 10 and 11, Red Lion Court, Fleet Street, E.C.)

south and being on a raised bank, a foot high."

"The Dahlias at the back have very brilliant flowers."

"They are all one variety called Duzon. The blooms early in June were ten inches across, and I think most effective. I have had them for four years, and find nothing equal to them for London use."

Nasturtiums and Musk.

"What is your preference in Nasturtiums?"

"The only variety we grow is Sutton's Salmon Queen, raised from seed in a box in March. They come into flower the first week in June, and last well into September. Near the Nasturtiums is a quantity of Musk, which comes up year after year. The only treatment we give is to top-dress it. And this, I think, exhausts the interest in the flowers out of doors. You might like, before we go into the houses, to note one or two other features of the kitchen garden. For instance, Gooseberries are grown on standards, all clear from the ground. We had a very big crop this year of Lancashire Lass, Champagne, Whitesmith, and Whinham's Industry. There being no walls, we have, of course, no walled fruit. In regard to vegetables, French Beans are rather a feature, and we have two beds of Asparagus, twenty years old, which have never failed us. All we do to the beds is to dress them with a foot of decayed manure on the top. For bedding purposes, we find pits answer the purpose admirably."

"I notice that in the next house you have a very fine display of Crotons, with Stephanotis on the roof."

"It was originally an early Vinery, but is now mainly devoted to Crotons and Caladiums."

Prize Tomatoes.

"You have lately distinguished yourself by taking prizes in important competitions for Tomatoes."

"At the show of the National Vegetable Society I took the first prize for the two largest bunches, and a special prize for three plants of new varieties in pots. The varieties were Monarch, Moneymaker, and Queen Alexandra, a seedling of my own. There were twenty-seven fruits on one branch of the latter, and eight branches on one stem, the plant being about six feet long. I also took first prize for the largest bunch at Manchester."

"How do you grow your Tomatoes?"

"I raise them from seed in January, and grow in a 10-in. pot, and plant out three feet apart on the roof of the house on wire, giving plenty of air. They ripened the first week in June, and we have had a continuous quantity until September 15th."

"You still have some very good fruits left. I observe, also, that Amaryllis is evidently a feature in your plant houses."

"The only two named varieties are Masterpiece, a very dark red, from which we get blooms eight inches across, and Scarlet Perfection. The remainder are seedlings."

"Are you taking any of these plants to Sussex?"

"A certain number, of which I have made a special study. These I propose to grow and show. In the next house, Orchids, chiefly for late spring and summer, are grown. The creepers on the roof are three varieties of Gloriosa superba, aurea, magnifica, and Plantii Rothschildiana. Amongst Palms you might note Carota, a very rare variety, resembling a Maidenhair Fern, and in this house there is also a collection of Pandanus Veitchii, which we use for the table, keeping young stock by cuttings."

Pancratiums in Bloom.

Passing into the Fernery, my attention was attracted immediately by some lovely Pancratiums in flower, whose fragrance filled the house.

"How long do they remain in flower?" I asked.

"For three weeks. The bulbs from which they are grown are fifteen years old. Outside these houses is a border with Nicotiana affinis, Eulalias, and Geranium Flower of Spring, edged with Box; further on, Sutton's purple and salmon Ten-week Stock, put out early in April, and flowering from June until September."

Resuming in the houses, I noticed a large collection of Azaleas, and a fine specimen of the Honeysuckle-scented Rhododendron, whose age I enquired.

"It is fifty years old," replied Mr. Abbott, "and a single flower measures from three to four inches across. That is one of the special plants I am taking to Oakover. The Lantanas, which you see with such pretty pink flowers, are very useful for dot plants outside. We finish with the Fernery."

"Last, but not least. Here, I observe, you go in for Orchids as well."

"Chiefly Odontoglossum Crispum, one with a

A RURAL WALK IN LONDON—THE FERNERY AT THE HOLME, REGENT'S PARK, LONDON.

(Photo. by The Topical Press Agency, 10 and 11, Red Lion Court, Fleet Street, E.C.)

spike of thirteen flowers; also Oncidium concolor. Odontoglossums do well enough with Ferns, on a damp bottom. Another Orchid which also appreciates the association with Ferns is Sophronitis grandiflora, a very pretty scarlet Orchid. You can see for yourself that the rafters of the house are a suitable place for Hoya carnosa, with its delightful perfume."

"Are all the Ferns planted in rockwork?"

"Yes, there is no woodwork whatever. The Ferns were originally planted in pockets, but are now running all over in various directions. The Mango, which is rather a feature of the Fernery, has only fruited once, but the foliage

THE TEMPLE AT THE HOLME, REGENT'S PARK.

(Photo. by The Topical Press Agency, 10 and 11, Red Lion Court, Fleet Street, E.C.)

is very fine, and other ornamental features of the house are Begonia Rex, the different mosses, and Lycopodiums."

A Striking Flower.

"You have forgotten to mention the remarkable plant with noble foliage, and one of the most striking flowers I have ever seen."

"You have come at a fortunate moment for the plant you mean. Hedychium jejueba does not remain in flower more than a fortnight. The root is like the ginger plant, and the flower is very spicy in odour, bearing some resemblance to ginger. We have several specimens, and we start them early in the spring at the same time as the Ferns. Of the latter you might mention Asplenium flaccidum. We get all the stock from one plant. As you see for yourself, they grow on the tips. In November I make a point of drying all the Ferns off, allowing them to rest for two months, and starting naturally in February with moist heat."

Mr. Abbott's Career.

"Before you tell me about your own showing and career, I should like to know the age of the magnificent specimen of Wistaria sinensis on your own house?"

"It is forty years old, and we get masses of bloom from it. With regard to myself, I have been awarded forty first prizes and certificates, and one gold and two silver medals, chiefly at the shows of the Royal Botanic Society in Regent's Park; also in Kent and Devon. These awards were chiefly for Azaleas, stove plants, Orchids, Daffodils, and other bulbs, table and decorative plants, and Tomatoes; also groups arranged for effect. I have done well with whatever I have exhibited. My gardening career started with five years' training at the nurseries of Messrs. Veitch and Co. Subsequently I was foreman in succession at Ewell Castle, Surrey; Eastwell Park, Kent; and Streatham Hall, Exeter. This is my second appointment as head gardener, and it has been a very happy experience."

ALFRED WILCOX.

NEXT week, the gardens of Mr. McIntosh, at Havering Park, Essex, will be described.

IN PRAISE OF OUR ASTER SEED.—Mrs. P. (Luton) sends her best thanks to the Editor of GARDEN LIFE for the sweet Asters she received from issue some time ago. They are now blooming beautifully, and are very pretty in blue, pink, and white.

Abercrombie, John (1726–1806), *horticulturist and writer*
by Francis Espinasse, *rev.* Anne Pimlott Baker
© **Oxford University Press 2004–14** All rights reserved

Abercrombie, John (1726–1806), horticulturist and writer, was born in Prestonpans, near Edinburgh, the son of a market gardener. He was educated at a grammar school, and at the age of fourteen began to work under his father. He went to London about 1751, and was employed first in the Royal Botanic Gardens at Kew, and next at Leicester House; he then worked for nearly twenty years as a gardener for several noblemen and gentlemen, including the botanist William Munro. In the 1750s he married a woman employed in the household of Sir James Douglas, for whom he was working, and they had two sons and sixteen daughters. Abercrombie survived them all except for one son.

About 1770 Abercrombie established a market garden near Hackney, and also leased a public house near Mile End, which he turned into the 'Artichoke Tea Garden'. He later sold the lease and set up a nursery and market garden at Tottenham. His first work on practical gardening, *Every Man his Own Gardener*, appeared in 1767 under the title of *Mawe's Gardener's Calendar*. Abercrombie had written to Thomas Mawe, head gardener to the duke of Leeds, offering £20 in return for permission to use his name as author. The book was a great success, and eventually, in 1776, Abercrombie added his own name on the title page as joint author with Mawe. The book continued to be issued, in revised editions, until 1879. Abercrombie did not meet Mawe until after the publication of the second edition, when Mawe invited him to Yorkshire. They remained friends, and collaborated on *The Universal Gardener and Botanist* (1778).

In 1779 Abercrombie published his first book solely under his own name, *The British Fruit Gardener and Art of Pruning*. In the 1780s he published a number of books on practical gardening. One of the most popular of his works was the *Gardener's Pocket Journal and Daily Assistant* (1790), which by 1857 had reached a thirty-fifth edition. Among his more specialized works were *The Complete Forcing Gardener* (1781); *The Complete Wall Tree Pruner* (1783); *The Propagation and Botanical Arrangement of Plants and Trees, Useful and Ornamental* (1784); and *The Hot House Gardener, or, The General Culture of the Pineapple and Method of Pruning Early Grapes* (1789); a German translation of this appeared at Vienna in 1792. Abercrombie was also invited to Russia to superintend the gardens of Catherine the Great, but he panicked at the last minute and did not go, sending a copy of *Every Man his Own Gardener* instead.

In 1796 Abercrombie moved to Somers Town in central London, and worked on *The Practical Gardener* and on revising his earlier works. Despite the success of his manuals, he became impoverished at the end of his life, and was supported by his friend James Donn, curator of the Cambridge Botanic Garden, who brought out *Practical Gardening* in 1813. Abercrombie died on 15 April or on 2 May 1806 at his house in Chalton Street, Somers Town, London, after falling down some steps and breaking his hip.

portance to found new species on; in times past, and in our own times under some prevailing theories, the variations would be looked for under some law of external influences modifying form. Without offering any opinion on these points, he would simply observe that all these plants were taken from one small spot at Berlin, New Jersey, and had all been growing in his garden under exactly the same circumstances together.

—— In accordance with long-established Whit-Tuesday custom what is known as the FLOWER SERMON was given on the evening of the 6th inst. by the Rev. Dr. Whittemore to a crowded congregation in the ancient City church of St. Katherine Cree. At this interesting service, as the *Daily News* has explained, the young persons for whom it is specially designed attend with nosegays of flowers, the hymns sung are chosen for their allusions to the flowery gifts of the summer season, and the sermon is preached upon some one of the many flowers mentioned in the Bible. It is about twenty-three years since it occurred to Dr. Whittemore to profit from the universal interest that is taken, especially among children, in flowers, by choosing this convenient day in the season of flowers for a children's service. The experiment was so successful and so acceptable to both young and old that it was continued; as a matter of course the service is now quite a City institution. Children with bouquets, and adults with smaller nosegays or button-hole flowers, fill every available space in the old church, and the preacher looks down on a veritable garden as he pleasantly discourses on his particular theme. Until the old-fashioned boxes in the church gave place to the modern pew the sight to individual members of the congregation will not be nearly so striking as it must be from the pulpit. Still, there are the ancient costumes and the happy faces of the Aldgate Ward charity children to be seen in the organ gallery, with their bouquets—the gifts of the churchwardens—and the not less beaming faces and smiling nosegays of the children in the centre aisle from St. John's School, Westbourne-park, not to speak of the display of flowers around the visitor in whatever box he may find himself inclosed. In the pulpit is a nosegay which has been placed there by a hand that recognised Dr. Whittemore's interesting services in the same way many years ago. The hand was then that of a gratified child, who now attends the services as a married woman, with children of her own, but who still claims the privilege of thus adorning the pulpit from which she has so long derived pleasure and instruction. Dr. Whittemore acknowledged this little attention almost in his earliest words. His discourse on this occasion was on the Olive flower from the text in Job xv. 33, "He shall cast off his flower as the Olive."

EARLY WRITERS ON ENGLISH GARDENING.

No. 15.

JOHN ABERCROMBIE.

It has been said with almost as much truth as wit that "Every man his own lawyer" would insure that he had a fool for his client; but it is not so in horticulture, and we have no hesitation in declaring our opinion that the little volume entitled "Every Man His Own Gardener" succeeded in diffusing a love for gardening, and enabling anyone to practise it successfully, more than any book that has been published. Yet so humbly did the author of that work estimate his own ability to instruct, and so little did he think anyone would admit him as a teacher, that Dr. Goldsmith was engaged to revise its language, and Mr. Mawe, the gardener of the Duke of Leeds, to see that its teachings were correct. They neither of them performed the duties they had undertaken, though Mr. Mawe received twenty pounds for allowing his name to be on the title page, and Goldsmith remarked that "Abercrombie's style was best suited to the subjects of which it treated."

The author—the entire and unaided author—of that volume was JOHN ABERCROMBIE, whose name is a household word among both amateur and professional gardeners, and to trace his career we now devote our attention.

He was born at Edinburgh in 1726, near which city his father conducted a considerable market garden. From his infancy he was employed to assist in this undertaking which was one particularly suited to his taste. At fourteen he became an apprentice of his father. He was thoroughly grounded in his profession, the practice of years being retained and concentrated by a habit we commend to all young gardeners of committing to paper the observations he made in its pursuit from a very early age. Soon after his apprenticeship expired, being about eighteen, upon a domestic misunderstanding he came to London, where he obtained employment in some of the Royal Gardens, at Kew, and at Leicester House. Afterwards he became gardener to Dr. Munro and other gentlemen. About 1751–2 he became gardener to Sir James Douglas, during his continuance in whose service he married. Fearing his family might become troublesome he left his situation in 1759, and returned to Scotland with the intention of becoming kitchen and market gardener, but came again to England after an absence of only ten months. He was engaged in the service of several noblemen and gentlemen until 1770, when he engaged a kitchen garden and small nursery ground between Mile End Road and Hackney, attending Spitalfields Market with the products until 1771–2. At this period he became a publican in Dog Row, Mile End. His house was afterwards converted into the Artichoke Tea Gardens. By the importunity of his wife he left this and entered into the seed and nursery business at Newington and Tottenham Court, carrying on at the same time an extensive trade as a kitchen gardener and florist. The taste he displayed in arranging and the skill in cultivating gardens induced a recommendation to publish on those subjects; but it was long before his diffidence would allow him to make an attempt. He showed his MS. to Mr. Griffin, a bookseller in Catherine Street, Strand, who with Abercrombie's consent showed it to Mr. Mawe, the Duke of Leeds's gardener. Mr. Mawe highly applauded the work. When introduced to Mawe, whom he had never before seen, poor Abercrombie (as he used facetiously to narrate) encountered a gentleman so bepowdered, and so bedaubed with gold lace, that he thought he could be in the presence of no less a personage than the duke himself. However, they soon came to a right understanding, for he continued his visit for more than a fortnight and "fared sumptuously every day." He likewise received much information from Mawe, as the groundwork of improvements which he afterwards made in his book, "Every Man his own Gardener," and in other publications. They subsequently maintained a friendly correspondence for years. "Every Man his own Gardener" was first published under the authorship of Thomas Mawe only in 1767, and has passed through many editions. Afterwards becoming more confident Abercrombie published his "Gardener's Pocket Journal, or Daily Assistant," which obtained a very extensive sale and has since passed through many editions. Besides these he compiled many other books, of which we append a list.

For the last twenty years of his life he lived in a great degree upon tea, taking it three times a-day, seldom or never eating meat. He frequently declared that tea and tobacco were the great promoters of his health. His pipe was his first companion in the morning and the last at night. He often smoked for six hours without interruption. He never remembered taking physic until after the occurrence of the accident which caused his death, nor of having but one day's illness before his last, about twenty-three years previously.

He died from an accident on the 2nd of May, 1806. He at one period after the publication of his "Every Man His Own Gardener," had actually embarked to superintend the Gardens of the Empress of Russia, but the sight of the ocean inspired him with terrors which he could not overcome.

From 1796 to the time of his decease he continued to reside in Charlton Street, Somers Town, excepting when visiting or professionally employed. He was occasionally employed to plan gardens and pleasure grounds, for which he was sometimes handsomely remunerated. When unemployed he was a constant pursuer of knowledge and information at the various nursery grounds and gardens near the metropolis.

The following is a list of his horticultural works in the order in which they were published:—

1, "Every Man His Own Gardener, being a new Gardener's Calendar with Complete Lists of Forest Trees, Flowering Shrubs, Fruit Trees, Evergreens, Annual, Biennial, and Perennial Flowers, Hothouse, Greenhouse, and Kitchen Garden Plants, with the varieties of each sort cultivated in the English Gardens." London, 1767; twenty-sixth edition in 1857. In later editions Abercrombie's own name has appeared in the title-page together with that of Thomas Mawe which it originally bore alone, though he had nothing to do with its composition. 2, "The Universal Gardener and Botanist; or a General Dictionary of Gardening and Botany, exhibiting in Botanical Arrangement, according to the Linnæan System, every Tree, Shrub, and Herbaceous Plant that merits Cul-

ture." London. 1798. 4to. Mr. Weston says the first edition appeared in 1770. 3, "The Garden Mushroom, its Nature and Cultivation, exhibiting Full and Plain Directions for producing this Desirable Plant in Perfection and Plenty." London. 1779. 8vo. 4, "The British Fruit Garden and Art of Pruning, comprising the most Approved Method of planting and raising every useful Fruit Tree and Fruit-bearing Shrub." London. 1779. 8vo. 5, "The Complete Forcing Gardener, for the thorough Practical Management of the Kitchen Garden, raising all early Crops in Hotbeds, forcing early Fruit, &c." London. 1781. 12mo. 6, "The Complete Wall Tree Pruner, &c." London. 1783. 12mo. 7, "The Propagation and Botanical Arrangement of Plants and Trees Useful and Ornamental." London. 1785. Two vols. 12mo. 8, "The Gardener's Pocket Dictionary, or a Systematical Arrangement of Trees, Herbs, Flowers, and Fruit, agreeable to the Linnæan Method, with their Latin and English Names, their Uses, Propagation, Culture, &c." London. 1786. Three vols. 12mo. 9, "The Daily Assistant in the Modern Practice of English Gardening for every Month in the Year, on an entire New Plan." London. 1786. 12mo. 10, "The Universal Gardener's Kalendar, and System of Practical Gardening." London. 1789. 12mo. 1808. 8vo. 11, "The Complete Kitchen Gardener and Hotbed Forcer, with the thorough Practical Management of Hothouses, Fire Walls, &c." London. 1789. 12mo. 12, "The Gardener's Vade-Mecum, or Companion of General Gardening. A Descriptive Display of the Plants, Flowers, Shrubs, Trees, Fruits, and General Culture." London. 1789. 8vo. 13, "The Hothouse Gardener, or the General Culture of the Pine Apple, and the Methods of Forcing Early Grapes, Peaches, Nectarines, and other Choice Fruits in Hothouses, Vineries, Fruit Houses, and Hot Walls, with Directions for Raising Melons and Early Strawberries, &c." Plates. London. 1789. 8vo. 14, "The Gar-

Fig. 122.—JOHN ABERCROMBIE.

dener's Pocket Journal and Annual Register, in a Concise Monthly Display of all Practical Works of General Gardening throughout the Year." London. 1789. 12mo. The thirty-fifth edition is dated 1857.

He brought up and well educated a large family, but survived them all except one son, who distinguished himself in the navy.

BIXA ORELLANA—ANNOTTA.

It is from the shrub the foliage and flowers of which is now figured that the Annotta of commerce is produced. Plants are seldom seen in this country except in botanical collections; but they are not devoid of ornament by their fine green leaves and chaste pink flowers. When grown from seed the plants attain a large size before producing flowers; but when raised from cuttings they flower freely when in a comparatively dwarf state. Cuttings of half-ripened wood strike readily in heat under a bell-glass. The plants require a summer temperature of 65° to 85°, and a winter temperature of 50° to 60°. This shrub grows spontaneously in South America and is cultivated in the East Indies. The fruit is like a Chestnut, a two-valved capsule covered with flexible bristles, and contains a certain number of seeds smaller than peas. These seeds are covered with a soft, viscous, resinous pulp of a beautiful vermilion colour and unpleasant smell like red lead mixed with oil; and it is this matter which constitutes Annotta. The mode in which it is obtained is by pouring hot water over the pulp and the seeds, and leaving them to macerate until they are separated by pounding them with a wooden pestle. The seeds are then removed by straining the mass through a sieve; and the pulp being allowed to settle, the water is gently poured off, and the pulp put into shallow vessels, in which it is gradually dried in the shade. After acquiring a proper consistency it is made into cylindrical rolls or balls, and placed in an airy place to dry, after which it is sent to market. This is most common in the English market, and is in the form of small rolls, each 2 or 3 ozs. in weight, hard, dry, and compact; brownish without and red within. The other process of manufacture is that pursued in Cayenne. The pulp and seeds together are bruised in wooden vessels, and hot water poured over them; they are then left to soak for several days, and afterwards passed through a close sieve to separate the seeds. The matter is then left to ferment for about a week, when the water is gently poured off, and the solid part left to dry in the shade. When it has acquired the consistency of a solid paste it is formed into cakes of 3 or 4 lbs. weight, which are wrapped in the leaves of Arundo or Banana. This variety is of a bright yellow colour, rather soft to the touch, and of considerable solidity. Labat informs us that the Indians prepare an Annotta greatly superior to that which is brought to us, of a bright shining red colour, almost equal to carmine. For this purpose, instead of steeping and fermenting the seeds in water, they rub them with the hands, previously dipped in oil, till the pulp comes off and is reduced to a clear paste, which is scraped off from the hands with a knife, and laid on a clean leaf in the shade to dry. Mixed with lemon juice and gum it makes the crimson paint with which Indians adorn their bodies; and they employ the leaves and roots in cookery to increase the flavour and give a saffron colour.

Fig. 123.—Bixa orellana.

Annotta is principally consumed by painters and dyers; but it is also used in Cheshire, Gloucestershire, and North Wilts to colour cheese with the pale yellow or flesh colour which distinguishes that which is made in these districts, the makers in Cheshire using 8 dwts. to 60 lbs. of cheese; while those of Gloucestershire use 1 oz. to 1 cwt.—quantities which are too small to affect the cheese in any way except in colour. The Dutch use it for heightening the colour of their butter. It is used for the same purpose in some English dairies.

SAXIFRAGA NEPALENSIS.

I am glad to observe that this charming plant was awarded a prize at the late show at South Kensington. Excellent as it is when grown in pots for conservatory and dinner-table decoration, it is of even more value as a hardy rock plant, because its elegant and prettily-marked foliage disposed in rosettes with that precision which is characteristic of this class of plants, always renders it an interesting and ornamental object throughout the year, and now when it is seen in the full glory of its slender tapering flower spikes, there is no plant more striking or attractive. It forms suckers, or what may be with greater propriety, termed lateral shoots, abundantly, so that a stock of it is easily obtained, every shoot rooting readily in an open border after it is separated from the parent plant.

It is by a judicious and tasteful admixture of plants of this type with others of bolder growth that a rockery can be rendered one of the most interesting and attractive features of a garden.—Edward Luckhurst.

[Nepalensis is a name which has been fancifully applied to the fine old plant, S. cotyledon var. pyramidalis.—Eds.]

OUR BORDER FLOWERS—GAILLARDIAS.

Gaillardias are by no means an extensive group of plants, yet they are worthy to be recorded in the Journal, for it would be difficult to find a more beautiful family of summer and autumn-flowering plants than the varieties of Gaillardia picta. When this plant made its appearance among us some thirty or more years ago we tended it carefully as a choice greenhouse plant, and it was looked on as a wonderful acquisition to our collections, and when we found it would do us good service outside as well we admired it the more. Somehow or other

The Gardens of Lord Avebury, at High Elms, Farnborough, Kent.

INTERVIEW WITH MR. A. D. ADAM.

BY the courtesy of Lord Avebury, I had the opportunity, on the 1st of August, of visiting the gardens at High Elms, which are of exceptional attractiveness, not only because of their beauty and extent, but because they contain an unusual number of rare plants, trees, and shrubs therein. Moreover, Lord and Lady Avebury themselves take the keenest interest in the gardens, and as Mr. Adam, the head gardener, said to me when he showed me round, he owes the success he has achieved to the fact that they afford him every encouragement and assistance. As we walked towards the terrace, he pointed out that the gardens have no boundary of fence or wall to divide them from the noble park of between three and four thousand acres, with a grass drive from three to four miles in length, fringed with Norwegian Maples, Lilacs, Laburnum, and other well-known shrubs. Mr. Adam has charge of the woods and plantations, as well as of the gardens, and is evidently concerned to maintain the whole of the demesne under his charge in a manner befitting its natural charms.

Creepers on the Mansion.

Skirting the Pinetum, which is on one side of the house, and reserving it for our attention later, we started with the creepers which adorn the building itself, and I commented on their variety.

"There is an unusual number," rejoined Mr. Adam, "noticeably Vitis heterophylla dissecta (beautiful foliage), V. Coignetiæ, Ampelopsis tricuspidata and A. murulis, Polygonum multiflorum, Clematis paniculata, magnifica, and coccinea; Hedera Emerald Green, contracta, and digitata aurea; Magnolia grandiflora, Cratægus pyracantha Lælandi, Inulusi variegata, and Lonicera brachypoda."

HIGH ELMS, FARNBOROUGH, KENT.

"How long is it since the very fine breadth of Roses facing the house was planted?"

"Three years ago, and it has been in full flower for nearly a month. In order to harmonise with the colour of the Roses, Geraniums Madame Crousse are used for the vases, and on the south side, under the house, there is a border of the same variety. The pergola, which runs the whole length of the house, is also planted with a view to the blending of colours. The creepers on it are Clematis in variety, Lonicera brachypoda and other varieties, Cratægus pyracantha, Cotoneaster Simonsii, Vitis in variety, Ampelopsis in variety, and Hedera in variety."

A Remarkable Herbaceous Border.

"I suppose the sloping herbaceous border facing the dining-room window is one of the principal features?"

"Yes, it is nearly a quarter of a mile long, and ten feet wide, with a grass path thirty feet wide, in the centre, intermingled with side paths. The border is not only used for herbaceous plants, but from the first day of spring, when the bulbs come into flower, until well into October, it is a continual source of interest. All the best-known herbaceous plants are, of course, represented; and, to further beautify it, we some time ago planted the huge arches of Crimson Rambler Roses behind."

"You might mention the names of a few varieties now in flower, or some specially rare."

"As to rare varieties, the Squirting Cucumber (Mordica elaterium) is worthy of notice. Just now the plants in flower embrace Dictamnus fraxinella, Salvias, Geranium Pratense, Delphiniums in great variety, Phlox in great variety, Monarda didyma, Geranium armenum, Menziesia polifolia, Spiræa aruncus (in large clumps), Chelone barbata, Potentilla nepalensis, Echinops ruthenicus, Valerian alba and rosea, Epilobium hirsutum, and Sedums, notably S. Sieboldi, which is especially pretty for edging. Other varieties include Astrantia minor, Aconitum ferox, Agrostemma coronaria, Gentiana asclepiadea, Lithospermum graminifolia, Diervilla seniliflora, Omphalodes verna, Mimulus luteus, Anchusa italica (Dropmore variety), Myosotis palustris semperflorens, Astilbe Davidii, Potentilla atrosanguinea (Gibson's variety), and Salvia Soulei."

"We now come," continued Mr. Adam, "to perhaps the greatest features of the garden, namely, the lakes, of which there are five, all of these being furnished with up-to-date aquatics. Each lake also contains a different class of fish—one has Loch Leven trout, another Japanese goldfish, a third bream, a fourth tench, and a fifth carp. Lilies are strongly represented, including Nymphæa alba, and Nitida odorata, rosea, and tuberosa. A quantity of Lythrum roseum is used on small islands on the lakes. We propagate it by just dividing, and it gives, as you see, a great mass of flowers. Amongst the aquatic and lake plants are Spiræa gigantea, palmata (one of the best, a deep pink), and rotundifolia; Epilobium angustifolium, Cypress longus, Astilbe major, Saxifrage peltata, Lysimachia vulgaris, Aponogeton angustifolia, fine plants of Orontium aquaticum (the common name of which is Golden Club), Gunnera elliptica, Typhea latifolia, Senecio clivorum, Acorus japonica variegata, Imperatrix (in large clumps), Arundo conspicua and donax, Requisetum palustra, and Campanula hederacea. There are many other beautiful plants to interest the botanist, amongst these being water Iris, water Violets, and water Ranunculus."

MR. A. D. ADAM.

Bamboos and the Rose Walk.

"I see that the banks of the lakes are decorated with fine specimens of Bamboos."

"The Bamboos are considered some of the finest in England, and include the best varieties. Of the Arundinaria species, the varieties are auricoma, Simonsii, metake, nitida, Fortuneii variegata, and Hindsii. Phyllostachys is represented by nigra, henonis, violenceus, aurea and viridi glaucesens; and there are also some remarkable specimens of Bambusa palmata."

Retracing our steps a little to the herbaceous border, we spent some time in the lovely Rose walk, with Lavender and Lilac hedges on either side.

"This walk," said Mr. Adam, "was designed by Lady Avebury, who thought that the hedges would protect the Roses in the early spring from cold winds. The varieties of Roses are Hybrid Teas—Kaiserin Augusta Victoria, La France, and Gloire Lyonnaise; and Teas—Madame Falcot and Madame Lambard, which do extremely well here."

The collection of flowering shrubs, which is one of the most notable in England, then claimed attention.

"They are not arranged in any particular order?" I asked, as I noticed a fine specimen of Pyrus arbutifolia.

"No, quite promiscuously; and in every case with the idea of giving each specimen of shrub or tree plenty of room to develop. Also the ornamental aspect is always kept in view, just as in the case of the Crimson Rambler Rose now facing us, which grows in a wild state, mixed with Sweet Brier, the Roses having a background of Japanese Acers and Copper Beech. This portion of the wild garden used to be planted up with Elms and Pines, a number of which have been removed. As you have already seen, the islands in the lakes are also planted more or less with shrubs. Would you like me to give you the names of some of the principal?"

"I should be very glad if you would do so."

"Spiræas do particularly well, especially Anthony Waterer, the Japanese variety. One of the prettiest of shrubs is Euonymus alatus. Other Spiræas are Reevesiana, prunifolia, and hypericifolia. The Berberis family is represented by asiatica and buxifolia; the Escalonia by Ingrami macrantha and rosea; the Cotoneaster by myrtifolia, frigida, fanchetti, horizontalis, and pannosa; the Phyllyrea by decara and augustifolia."

"What about the Pittosporum?"

"The two varieties are P. crassifolium and P. engenioides. Then there is the Cistus, of which we have lanifolius and florentinus. Perhaps the better plan would be, for the rest, to give you the names of a single prominent variety. Thus there is Olearia Haasti, Agara microphylla, Forsythia suspensa, Periploca gracca, Garrya elliptica, Pyrus malus floribunda, Daphne mezereum, Hedysarum mullyngum, Spartium junceum, Fraxinus acubæfolia, Prunus Pissardi, Staphylea colchica, Phlomis fruticosa, Artemesia lactiflora, Elæagnus macrophylla, Ceanothus Veitchianus, Andromeda mariana, Abelia floribunda, Pernettya mucronata, Veronica la Seduisante, Skimmia japonica fragrans, Acer tomentosum, Philadelphus Manteau d'Hermine, Tamarix hispida, kashgarica, Cornus stolonifera, Amelanchier arbutifolia grandiflora, Quercus pedunculata pectinata, Abelia rupestris, Desfontainea spinosa, Lambucus canadensis, and Comtonia asplenifolia. Such shrubs as Magnolia, Hibiscus, Wegelia, and many others, are also represented in various parts of the pleasure grounds. I may say that Lord Avebury has all trees and shrubs trained to a leader, the impression being that they stand the winter better, and are not so liable to break down with the snow."

The Pinetum.

"I should like the names of some of the Conifers in the Pinetum."

"There are fine specimens of Cedrus deodara, atlantica, and atlantica glauca. The specimens of Cupressus include borealis lutea, Lawsoniana aurea, Lawsoniana alba spica, Chinensis aurea, and nutkaensis lutea. The Picea pinsapo here are amongst the largest in Great Britain, and Abies pungens glauca is also well represented. There are fine specimens of Wellingtonia gigantea, Thuia Lobbi aurea, Thuiopsis dolobrata, and Viola aurea. Yews, both Irish and Golden, are largely represented."

"Is there anything special in the conservatory?"

"It is largely filled with Palms, Orchids, and Ferns in baskets, the roof being covered with Stephanotis floribunda, Bougainvillea glabra, and Asparagus plumosa."

Before we entered the kitchen garden—about three acres in extent, which is chiefly devoted to fruit and vegetables, containing in flowers only a few Sweet Peas and Carnations—we went into the glasshouses. In one of these, built according to modern requirements, were the Carnations, Caladiums, Cucumbers, and Tomatoes, two houses being devoted to Melons.

THE LAKE AT HIGH ELMS.

HERBACEOUS BORDERS AT HIGH ELMS.

"The Melons grown are all of one variety," replied Mr. Adam to my inquiry, "the Cucumbers Telegraph and Rochford Market, the Tomatoes Duke of York. I believe in intensive culture. Early salads are obtained from the borders, French Beans, Radishes, and Lettuces being all grown together. We pull Radishes first, cut Lettuces later, and French Beans come in subsequently. Plenty of salad is a great thing in the London season."

"What varieties do you grow in the three Peach houses?"

"In the first, Hale's Early, Crimson Galande Lord Napier, and Sea Eagle; in the second, Cardinal and Early Rivers' Nectarine; in the third, Dymond and Rivers' Orange Nectarines. In the stove and Orchid houses are Crotons, Dracænas, and Pandanus, the Orchids being Cattleyas, Dendrobiums, and Cœlogyne cristata; also a fine lot of Calanthes."

"And the three Vineries?"

"Black Hamburgh, Buckland's Sweetwater, Foster's Seedling, Muscats, Gros Colmar, Lady Downe, and Gros Maroc. The borders are all inside, and, as you can see, these give fine bunches of fruit. I do not believe in outside borders, the inside are more easily controlled. We pick Peaches and Grapes for quite six months in the year, beginning in May, and ending about Christmas."

"Your Pears in the kitchen garden, I observe, are chiefly cordon trained."

"Yes, and such varieties as Williams's Bon Chrétien, Pitmaston Duchess, Magnet, and Conference do equally well on east or west walls. On the south wall are Peaches, and on the north wall Morella Cherries. Apples, all dessert varieties, are mostly trained horizontally. I grow Strawberries in several different positions, in order to prolong the season—the earliest in the south border, the mid-season in the midst of the garden, and the latest in the north border. The bulk are Royal Sovereign, but Givon's Late Prolific, and Elton Pine are also used. It is not, in my judgment, wise

to grow many varieties of any fruit or vegetables."

Vegetable Cultivation.

"Do you care to say anything about the cultivation of vegetables?"

"We get two, three, and sometimes four, crops off the same ground in one season. I had Peas, Spinach, Potatoes, and Broccoli last year in succession off the same piece. In the long border, now filled with Beet (Dell's Crimson and Veitch's Improved Black), flowers were grown earlier. I am convinced that the principle of changing the ground every year is of great importance, and of material help in securing crops."

"During your training, did you have much to do with vegetable growing?"

"Yes, as a matter of fact, at Charleton Gardens, Montrose, where I served my apprenticeship under Mr. John Wilson, vegetables were a leading feature, and Mr. Wilson was a noted grower in his day. From Charleton Gardens, I went to Castle Huntly, in Perthshire, under the famous fruit-grower, Mr. James Beisant, and then to Rossie Priory, Lord Kinnaird's seat, under Mr. Doig. Later I crossed the Border, and became foreman at Normanhurst, Lord Brassey's seat in Sussex, going from Normanhurst to Studley Royal, the Marquis of Ripon's seat, in Yorkshire, as general foreman. My first appointment as head gardener was at Bradbourne Hall, Sevenoaks, and my second at Lord Amherst's place, Montreal. Five years ago I came to High Elms as head gardener."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 319.—AUTUMN-SOWN ANNUALS AND WINTER DECORATIONS.

DEAR KATE,—There are various seeds for spring-flowering which should now be sown. Sweet Peas, for instance, which blossom a few weeks earlier than those put in during February and March, although it is true that they run some risk in the winter from severe frost, and sometimes from snails and slugs. Some authorities advocate strewing Fern or straw around the young plants, but this we have not found to answer, because the slugs congregate under such material, and are sure to destroy the Sweet Peas. Those which came through the severe winter of last year most successfully, were sown on an open, sunny border, well drained; and I think the middle of September is the best time for this work, as the seedlings are not then too large or too small. A shelter of sticks may be arranged over them, or at a yard's distance, to break the force of the wind from the north and east, and a dusting of lime, given at intervals during the winter, will help to keep off slugs. But if these marauders should threaten seriously, it may be well to put down little heaps of bran (which is their favourite food) around the seedlings, with a convenient shelter for the slugs when gorged, close to each. A large piece of pot-shard, or of rather rotten wood, suits them well, and on visiting these shelters in the morning, they will be found to contain a number of the slimy tribe. Shirley Poppies are hardy enough to stand well, if sown in the autumn, and the resulting plants are much finer than those sown in spring. They should, however, be sown extremely thinly; in fact, this applies to all autumn-sown seeds, as seedlings weakened by crowding are not likely to do any good. Rigorous thinning must be carried out if they come up too thickly. Shirley Poppies should be about a foot apart, each plant will then produce hundreds of flowers. With these Poppies, the blue Cornflower (Emperor William) is charming, and the seeds of this annual can also be sown now; with Mignonette, too, which germinates in the early spring, flowering much earlier than spring-sown plants. But it needs good, rich soil, well dug; and is apt to disappear in a poor, exhausted border.

A Beautiful Annual.

Nemophila insignis is one of the prettiest of all annuals, with its sky-blue blossoms; it stands well through the winter in well-drained soil; in fact, all autumn-sown seeds must have good drainage, as a water-logged position is fatal to them at that time. There is one drawback to Nemophila, specially serious in cities where cats abound, for these creatures are so pleased with the scent of its flowers that they roll on them in a most exasperating way when the blossoms open, which flattens them, of course—if it does not do worse. Godetias, which have been so marvellously improved of late years, can now be sown; the double pink varieties are extremely handsome, making a grand show of colour early in the following summer. Saponaria cambrica, too, a dwarf carpeting plant, is hardy, and most effective, as it is literally covered with blossom. Eschscholtzias, too, of the beautiful new tints in salmon-red (Rose Cardinal is a lovely one), and the various Clarkias (of which I like the double salmon-pink one the best), may all be sown to stand the winter, choosing a border sloping to the south, if possible, for them.

Winter Carrots.

In the kitchen garden we may yet sow a patch of Carrot seed, over which a frame can be lifted if severe weather should set in early in the winter. In sowing Carrots for winter drawing whilst small (and large Carrots are of no use, except for stews and soups), it is necessary to take special precautions, as all the grubs in the garden seem to attack them during a wet, cold time, if they are treated as in the spring. No manure must be added to the Carrot bed before sowing, and the soil should not be too rich; lime, however, should be plentifully forked in to the upper six inches, and the position of the border should be dry, sheltered, and sunny. As soon as the seed is up, a light dusting of lime can again be given, and this should be repeated at intervals, giving but little at a time, but often. Soot, too, can be used in the same way; grubs of all kinds dislike both these materials, and if the soil be free from wireworm, you should enjoy many a dish of young Carrots in the depth of winter. It is a good plan to fix a spare frame light above them, resting on four pots, at a height of about six

ROMAN HYACINTHS.

a week, and as they are not killed by any insecticide, a single spraying is not sufficient. It should be repeated at intervals for, say, a fortnight, to be on the safe side. When the pest is not completely destroyed, the last batch of eggs remains attached to the fallen leaves during the winter, and, unless these leaves are collected and burned, the insects will reappear the following year.

Too Many Beauties!

September 16th.—The camera may seem a curious gardening implement, and yet there are many cases in which it would be most useful. A short time ago I went to see a garden which

MR. J. ADAMS.

has a reputation for its beauty, and, though there was much to admire in it, I was vaguely conscious that there was something wrong. It was not, however, until I began to select views suitable for photographs that I discovered what was the matter. I could hardly find a single one. Everything was so crowded that there was no concentration of interest, and, even where it was possible to get farther away, this fact remained to destroy the pictorial effect. In short, there were far too many beauties. In the words of the old proverb, it was impossible to see the wood because of the trees. The ideal garden consists of a series of pictures, the simpler the better, each with a central object for the eye to rest on, and each with an adequate frame to isolate it from the others. In this garden there were no central objects—all the plants had equal or almost equal pictorial value—and there was no frame. The whole was a large floral panorama. It was fairly clear how this effect, or want of effect, had been produced. The garden must have been laid out during a period of years, a little added here and a little there, without any general plan. The practice is not uncommon, and it nearly always ends in confusion. Unless the broad lines are laid down first, the result must be largely a matter of chance.

Sundials.

September 17th.—Mr. Millin, in "Pictorial Gardening," says that sundials have gone out of fashion. That may have been true some time ago, but of late years there has been a distinct revival, while from many old-world gardens they have never been absent. They are not out of place there, and when Roses and other plants are grouped around, they serve as central objects in the picture, and so concentrate the interest which, without them, might be too diffused. Their utilitarian value is gone, of course, in these days of cheap clocks and watches, but their associations will always endear them to the lover of flowers.

H. C. DAVIDSON.

The Gardens at Hincheslea, Brockenhurst.

INTERVIEW WITH MR. J. ADAMS.

THE delightfully-situated residence known as Hincheslea, though only two miles from Brockenhurst Station, is in the heart of the New Forest, and combines all the charms of seclusion with readiness of access. It was at the end of July that I was able, by the courtesy of Miss M. Lovell, to visit the gardens, and I found them looking extremely well. At the suggestion of Mr. J. Adams, who has charge of both the estate and the gardens, we first made our way to a little rockery, which has recently been added, in a lovely dell not far from the house.

"It is made of Forest stone," said Mr. Adams, "and, as you see, there is a wealth of Ferns. The varieties now in flower are not very numerous, but they include Corydalis lutea, Iberis correæfolia, Campanula Haastii, Veronica rupestris, Dianthus deltoides, Saxifrages in variety, Alpine Phlox, Alyssum montanum, Cistus Florentinus, Gypsophila repens, Veronica decumbens, Plumbago Larpentæ, and Helianthemum vulgare. In selecting this site I was influenced by the surroundings, and by the fine trees which make a pleasing feature. It is also a convenient position, because it is in close proximity to the flower garden."

"The number of beds must be very large," I said, as we entered a charming pleasaunce, intersected with green walks, also overshadowed by trees.

"There are twenty-four on each side. As to the contents, there are four with Begonia Fairy Queen, some edged with white Lobelias, and others with Alyssum Little Dorrit. Then, there are four of Geraniums Henry Jacoby, dotted with Abutilon Thompsonii, and edged with Alyssum Little Dorrit. Two beds consist of Geraniums Mrs. Pollock, with a centre of Lobelias Queen Victoria, edged with Lobelias Katharine Mallard."

"What are the varieties of Dahlias in two of the centre beds?"

"Mrs. Carter Page in one, and Little Dolly in the other. The two beds are otherwise alike, each combination being Eucalyptus globulus and Geranium Manglesii. The two beds with Marguerites in the centre have, as groundwork, Geraniums Madame Crousse, edged with Alyssums, while two others, the shape of wings, are filled with Ageratums Mauve Queen and Pyrethrums Golden Feather."

"You have more beds of Begonias?"

HINCHESLEA, BROCKENHURST, HANTS.

"Yes, two of Semperflorens, with dot plants of Abutilon Thompsonii, edged with single blue Lobelias. There is also one bed of scarlet Begonias of another variety. The two beds of yellow Chrysanthemums are dotted with tall-growing Lobelias, and have a groundwork of

Digitized by Google Original from CORNELL UNIVERSITY

Marigolds Legion of Honour. Near these is one bed of Coreopsis grandiflora and single blue Lobelias, also one of South African Marigolds, and the same edging."

Combinations in Pairs.

"But most of the combinations are in pairs?"

"Of Antirrhinums, in art shades of nearly all colours, there are four beds. But there are two of Verbenas, a dark blue seedling, and Gladioli in variety; two of double Dianthus and Gladioli; two of Phlox Drummondi and Alyssums Little Dorrit; two of Verbenas Princess of Wales, edged with Daisies (giant-flowering); two of Gaillardias (seedlings), edged with Phlox Drummondi; two of Violas Maggie Mott; two of Violas Kitty Bell; and two of single Petunia seedlings and Gladioli in variety. There is one bed of scarlet Geraniums, a cross between Ivy-leaf and Zonal; the cuttings of these were brought by Miss Lovell from Switzerland three years ago."

"The flowers are very fine. And the three beds at the side?"

"They are made up of Ageratums and Mimulus, with Lobelia cardinalis in the centre, edged with Geraniums Manglesi. All round the borders are trained Ivy-leaved Geraniums Charles Turner, and Alyssums and Phlox Drummondi, the idea being the prevalence of scarlet and white."

"Do you have any trouble with rabbits?"

"We scare them by the use of Renardine, which is put on a little string."

The Spring Bedding.

"Do you fill all the beds with spring flowers?"

"Yes; and chiefly with Wallflowers, not mixed, but planted according to colour. With these we use Aubrietias, Myosotis (white and blue), and double white Alyssums."

"I should like to know the names of the Wallflowers."

"Belvoir Castle, Blood-red, Salmon Queen, Ruby Gem, Primrose Dame, Golden King, Vulcan, and Doubles. They are all grown separately, and I get them all to flower the same year they are planted, except the Doubles, which flower the second year."

"You have a nice specimen of Crinum Moorei in the conservatory," I said, as we approached the house, which stands on rising ground.

"Yes, the South African Lily does well here. The Geraniums in flower in the conservatory are chiefly Henry Jacoby and Queen of the Belgians; the doubles are better. Near the house is a bed of the new hybrid Nicotianas."

The Rhododendron Walk.

"What about Rhododendrons?"

"They flourish in the New Forest. We have a great many varieties in the Rhododendron Walk. The soil is peaty, and therefore ready-made. The varieties include Pink Pearl, Lady Eleanor Cathcart, Doncaster, Blandyanum, Caractacus, Caucasian, Concessum, Frederick Waterer, John Waterer, Marie van Houtte, and Sir Thomas Sebright. We are going to increase the number. About a dozen are forced every year, and after forcing the plants are put out for two years. The same course is pursued with Azalea mollis. Both shrubs and Conifers seed themselves. This notably applies to Abies Douglassi and Oaks. To show how well Conifers do here, I may say that a bed of Myosotis (a seedling) flowers in the winter under a Cupressus Lawsoniana. Speaking of Oaks, the pergola with Roses was made of Oaks from the park, which had seeded themselves. We never plant any. The varieties of Roses on the pergola include Dorothy Perkins, Hiawatha, Queen Alexandra, and Field Marshal."

THE FLOWER GARDEN AT HINCHESLEA.

The outskirts of the pleasure grounds, which include a number of double hedges, were next explored, notably the Rose quarters, which face a hedge of Rhododendrons, with varieties of the Hybrid Perpetual sections. For practical purposes, however, the features of the outskirts may be taken with those of the decorative kitchen garden, with its brilliant borders, and many patches of colour. Here I speedily discovered that Mr. Adams has a great affection for Dahlias and is a specialist of authority."

Fine New Dahlias.

"There must be many novelties in your fine line of Dahlias," I said.

"These are all new. One of the best scarlet is Dr. J. J. Gray, and one of the best salmon C. E. Wilkins. Clara is a good golden variety, and Etruria a pink with a yellow centre. Flame, Harold Pearson, and Lusitania are good scarlets; T. A. Havemeyer, a fine dark pink; Hyacinth, a yellow-buff; Dreadnought, a dark maroon. But in yellows, Mrs. J. J. Crowe, one of the old varieties, has never been beaten, and Hilda Shoebridge, also one of the old varieties, is amongst the best rich salmon colours. These, of course, are the Cactus section; but all the Pæony-flowered Dahlias are my own seedlings. I got some fine flowers with scarlet, brown, yellow, and streaked petals.

"Now," continued Mr Adams, "we come to some of the older varieties. These embrace Nelson, Crimson Maroon, Kreimhilde (pink, with a white centre), Alight (scarlet-brown), Flounce (of which I had a bloom eight inches across), Mrs. J. Grinstead (cherry-red, a glorious flower), Mrs. Macmillan (pink and white centre), Comet (a spotted variety), Good Hope (dark scarlet and white tips, with twisted petals), Antelope (also twisted petals, bronze, with gold centre), J. H. Jackson (the best of dark maroons), Lucifer (deep orange-red, crimson flowers), Thomas Parkin (light orange, with a splendid flowering habit)."

A Point in Cultivation.

"Is there anything special in your treatment?"

"No; but it should be remembered that Dahlias do not want to be heavily manured. If large flowers for exhibition are required, disbudding must be done; not otherwise."

"You go in for the Pompone Cactus also?"

"Considerably. One of the most beautiful of these for table decoration is Modesty. Other useful varieties are Coronation, Daffodil, Freedom, Glow, Little Fred, Mary, Peace, Polly, Starlight, and Titus. They are all grown with long stems, and flourish until the frost cuts them down. They all last well in water."

Treatment of Begonias.

"Begonias are evidently another of your features."

"All these plants which you see in pots were grown from a 3s. 6d. packet of seed. Out of the packet eighty per cent. were doubles. The colours include pink, scarlet, flesh, and white. Then I have the Crispa section, in different shades of colour. The edges are crisped."

"Is the treatment the same as that of the others?"

"Yes; I keep all the bulbs dry in the winter, start in the early spring in gentle heat, in well decayed leaf-mould; then they thrive without difficulty. There are also the crested Begonias, of which I have a number, the feature being, as you know, the narrow fringe running round the petal."

Zonal Geraniums and Chrysanthemums.

"Do you go in largely for Pelargoniums?"

"I have a couple of dozen seedlings, of Regal; but Zonal Geraniums are grown very largely. Half a score of the best are Dryden, Winston Churchill, Snowdrop, May Pelton, Nora, Picotee, Gertrude Pearson, Captain Holford, Blue Peter, and Paul Crampel."

"Any hints as to cultivation would be useful."

"The cultivation is very simple. A vital point is to pinch them and keep them dwarf. They should have plenty of sun and air in the summer. Mine, as you will observe, are grown out of doors, not inside."

"I observe also that you have a fine supply of Chrysanthemums in pots on the frame ground."

"We grow entirely for quantity, and have no big blooms. In the cultivation, the liberal use of weak liquid manure makes the plants thrive. As we have a herd of Guernseys, we always have plenty. Of a hundred varieties, the best are Mrs. Barclay, Madame P. Rivoire, J. E. Clayton, G. J. Warren, Algernon Davis, Soleil d'Octobre, M. Masse, Sunstone, Mrs. White Popham, Mrs. Kirk, C. H. Curtis, Mrs. Garner, Madame P. Radaelli, and F. S. Vallis."

"But you have also a large quantity of Chrysanthemums grown entirely out of doors."

"One bed entirely consists of Silver Queen, and amongst the best of other outdoor varieties are White Quintus, Flame, White Pet, Ravensbourne, Champ d'Or, A. J. Quintus, Little Dot, Gladys Grey, Miss Crissey, Rainbow, Harry Hicks, Sœur Melaine, Saint Michael,

Digitized by Google Original from CORNELL UNIVERSITY

Goacher's Crimson, and Ryecroft Glory. In the herbaceous border, which we are now approaching, there is a tall-growing white Chrysanthemum, which comes out long before any other variety. It is called Senis Plenus."

"Phlox are very conspicuous in the border."

"This used to be a vegetable border, but I find that both Pæonies and Phlox, as well as most other varieties of flowers, do exceedingly well here. The principal varieties of Phlox are Rose Queen, Coquelicot, Graf von Landsburg, La Tendresse, Etna, and Eclair d'Aout.."

Malvas and Sweet Peas.

Noticing a very long border of Violas Maggie Mott, in front of the Dahlias, I enquired when Mr. Adams began to flower his fine show of Malvas.

"The beginning of July; and they keep on flowering until the middle of August, the varieties being M. moschata (rose-pink), and alba (white). They are tall-growing plants, five feet high, with fringed petals, most useful for cutting. They do not require any special treatment. Cupidone is another beautiful flower for cutting, scarlet-maroon and lasting for three months."

"You have Sweet Peas in various parts of the garden."

"They are grown to obtain a succession until the frost comes. I start in January with Duke of Westminster, in big pots, for early work, growing more batches in February and March, and two further quantities out of doors. The other varieties started indoors are John Ingman, Dorothy Eckford, Black Knight, Helen Pierce, Jeannie Gordon, Mrs. Walter Wright, Lady Grisel Hamilton, George Gordon, Countess Spencer, Hon. Mrs Kenyon, and Lord Rosebery. They give us great masses of bloom, and so do the batches of Aster sinensis."

"You might mention any other flowers that you specially use for cutting."

"One that is well worthy of notice is Coreopsis Drummondi, which lasts in flower for two or three months, and yields thousands of blooms. Yellow in daylight, it turns white in artificial light. Then we use large quantities of scented Geraniums, Shrubland Pet, Lady Yarmouth, and Pheasant-foot, to mix with the flowers. The Border Carnations are mixed, and include one especially good, of dark colour; and Iris Kæmpferi is grown in all varieties of colour, particularly the whites."

How to Grow Salpiglossis.

"Your remarkable border of Salpiglossis, extending the whole length of your fruit houses, deserves more than a word of praise."

"The varieties are Veitch's Large-Flowering and Toogood's Emperor. I sow in March, bring the plants on inside in spring, and plant out; or, as an alternative, I sow in a bed on the top of a leaf heap, and transplant afterwards into a frame, bedding out at the end of May. These are all single plants, and each one is staked. The large-flowering variety is self-coloured, and Emperor striped. Each of the two lines of plants is fifty yards long, and the flowers are seen at their best in August. In front of the houses are Pansies Emperor Frederick, grown from seed—by far the best method."

When to Sow Zinnias.

"I suppose you vary the borders?"

"Yes; I have had Zinnias here, which make a fine display grown in a border. They should not, however, be sown before the end of April, or they get a chill from which they may not recover. I find Diascia Barberæ, a little pink flower, very useful for massing."

"Then there are the Roses grown as climbers on the walls and arches, which help to make the kitchen garden beautiful?"

"They are chiefly Alister Stella Grey, Alfred Colomb, Marechal Niel, La France, L'Ideal, Captain Christy, Catherine Mermet, Bouquet d'Or, Gruss an Teplitz, Duchess of Edinburgh, and W. A. Richardson."

Proceeding to the fruit houses, we entered the orchard house.

"The Peaches here," said Mr. Adams, "are Noblesse, Gros Mignonne, Goshawk, and Nectarine Lord Napier. The best Peach, and most largely grown, is Noblesse; it has not much colour, but the flavour is lovely. Noblesse is also grown in the second Peach house, with Alexandra and Royal George; and in the cold Peach house two of these varieties and Goshawk are grown. The fruit ripens in the late autumn. Here, too, in the beds we grow some Tomatoes. The soil is too cold to grow any outside. There are four Vineries, with both inside and outside borders. In the early house the only variety is Black Hamburgh; in the second, Black Hamburgh and Muscat of Alexandria; in the third, Black Alicante; and in the fourth, chiefly Black Hamburgh. I am growing most of these on the extension system, and get some fine bunches of fruit on the young wood."

The Best Hardy Fruit.

"With regard to your hardy fruit, what sort of crops do you consider you have this year?"

WALLFLOWERS IN THE KITCHEN GARDEN AT HINCHESLEA.

"We have a great quantity of Plums on the walls and standard trees, the varieties being Rivers' Early Prolific, Golden Drop, Greengage, and Monarch. Apples are grown entirely on standards. Half a dozen of the best are Lane's Prince Albert, Wellington, Blenheim Orange (which does splendidly), Ribston Pippin, Cox's Orange Pippin, and Lord Suffield. The varieties of Pears grown on the walls, fan-trained, are Beurre Diel, Pitmaston Duchess, Fondante d'Automne, Jargonelle, Beurre d'Amanlis, Doyenne du Comice, Emile d'Heyst, and Souvenir du Congres. We have had enormous crops of Gooseberries and Black Currants, a fact which I attribute to persistent trenching."

"What about Strawberries?"

"We keep the plants two years. Three hundred Royal Sovereign are forced; but these plants are destroyed after forcing. The other varieties are Givon's Late Prolific and Latest of All. More Apples are grown in the orchard, with vegetables below. Here we are gradually substituting new for old trees."

"And you grow most of your vegetables in the orchard?"

"Yes; although before the Pæony-flowering Dahlias in the kitchen garden I grow a crop of early Potatoes, Midlothian Early and Sharpe's Victor. The Beans I find most useful are Painted Lady, Ne Plus Ultra, and Hackwood Park Success."

"How late do you pick Peas?"

"Until the end of September. I obtain the later Peas by sowing early varieties at the end of June. The varieties grown in succession are Gradus, Superlative, Carter's Daisy, and Dr. McLean. Carrots are rather a feature, and the soil suits them remarkably well. The only variety is Veitch's Model."

"How long have you been in charge of the gardens here, Mr. Adams?"

"Four years. I started in Scotland at Buchanan Castle, Glasgow, proceeding next to Lennox Castle, subsequently to Inverary, and then to Ireland, to Carton Park, Kildare. Leaving Ireland, I was for a time in Messrs. Veitch's nursery, and next I was foreman, first at Stanmore Hall, and afterwards at Normanby Park, Lincolnshire. My first post as head gardener was at Cobar Hall, Buxton. Leaving there, I went to Lynchmere House, Haslemere, where I remained for seven and a half years. Before coming here, I was in charge of the gardens at Harefield Grove, Uxbridge, for three years. While I was at Haslemere, I did a good deal of showing, and since I have been at Hincheslea I have shown Dahlias largely with success. This month, I was first at Brockenhurst for Cactus varieties. Every year I obtain the newest varieties of Dahlias, and from the cuttings I am able to strike ninety per cent."

ALFRED WILCOX.

THE celebrated Vine at Hampton Court, which a few years ago was in a very poor condition, and could only produce a few bunches of half a pound each, or less, has been taken in hand by the authorities, who have built a new house over it, removed the flagstones from over the roots, and put fresh soil round the roots, under which treatment the Vine is improving rapidly, and bearing more and heavier bunches every year. Many of those on it this year are from two to two and a half pounds in weight. This world-famous Vine is a hundred and forty-one years old, and the stem just above the ground measures five feet in circumference.

Aiton, William (1731–1793), *horticulturist*
by D. J. Mabberley
© **Oxford University Press 2004–14** All rights reserved

Aiton, William (1731–1793), horticulturist, was born at Boghall, Carnwath, Lanarkshire, the son of John Aiton, farmer, and his wife, Jean Weir. With his two brothers he trained as a gardener on the Shawfield estate at Woodhall near Airdrie. In 1754 he settled in England and the next year became assistant to Philip Miller at the Physic Garden at Chelsea. In 1759 he was recruited by John Haverfield (*c*.1694–1784), gardener to Augusta, dowager princess of Wales, at Kew, to manage her small physic garden: his annual salary by 1770 was £120.

In 1764 Aiton met Joseph Banks, who was to have increasing influence over Kew through his friendship with George III. From about 1773 Banks oversaw day-to-day running of the gardens and, with Aiton, raised their scientific and horticultural stature, forming the foundation for the modern Royal Botanic Gardens. Seeds and plants were sent from expeditions to the growing network of botanical gardens projected by Banks with Kew at its centre: Banks appointed and sometimes supported collectors, though Aiton himself suggested sending Francis Masson to the Cape as early as 1772. Largely under Kew's aegis, almost 7000 plant species were introduced to British horticulture during the reign of George III.

On Haverfield's resignation Aiton took over the kitchen garden and pleasure grounds on 1 January 1783, becoming the first superintendent of the entire Kew estate. As early as 1773 a plant catalogue was begun and this list was the basis for Aiton's *Hortus Kewensis* (three volumes, published August to October 1789), which effectively covered all plants in cultivation in southern England, with engravings, some from drawings by Franz Bauer and Georg Ehret. Aiton took plants for identification to Banks's curator–librarians Daniel Solander and Jonas Dryander in Soho Square. Latin manuscript species descriptions by Solander were used by Dryander, who contributed most of the third volume himself, to make up the scientific text of the book, which is a major scholarly work dealing with some 5600 species arranged according to the Linnaean system. Although it appeared under Aiton's name, as Aiton was ‘Gardener to His Majesty’, he merely added the plants' dates of introduction and other horticultural matter: he had no botanical expertise or bibliographical skills. Specimens on which the new species in the book were based are in the Natural History Museum, London.

Aiton's wife, Elizabeth (*c*.1740–1826), bore him four daughters and two sons, the elder of whom, William Townsend Aiton (1766–1849), succeeded his father at Kew and brought out, with the help of Dryander and Robert Brown, a second edition of *Hortus Kewensis* (1810–13); the younger, John Townsend Aiton (1777–1851), became royal gardener at Windsor, and later at Frogmore and Kensington Palace. Aiton died, apparently of liver failure, on 2 February 1793; his pallbearers included the artist Zoffany as well as Banks and Dryander, and his remains were buried in an elaborate family tomb at St Anne's, Kew. The funeral sermon delivered at Brentford on 17 February by the Revd W. Smith was published as *Silent Submission to the Will of God* (1793), and Aiton's widow petitioned Banks to seek a pension: £150 per annum was granted.

Aiton's achievement was the consolidation of Kew Gardens under the supervision of Banks. He was commemorated in names of a genus of bryophytes, *Aitonia* (*Aytonia*), and, later, of the South African shrub *Aitonia* (= *Nymania*) *capensis* (Meliaceae), though neither name is in current use. Aiton House at Kew, built on part of the site of George III's Castellated Palace and opened in June 1977, accommodates the office of the curator, his deputy, and the plant records.

William Aiton (1731–1793): doi:10.1093/ref:odnb/260

IN MEMORIAM.

William Aiton.

Without entering into particulars of the early history of the Royal Botanic Gardens, Kew, it may be mentioned, in connection with the history of William Aiton, that they were famous in the first half of the seventeenth century, and were then the property, through marriage, of Lord Capel, whose name survives at Kew in "Capel House" near the bridge. About the year 1730 the Prince of Wales, father of George the Third, leased the property from the Capel family and began the extensive alterations and improvements, which were finished by his widow Augusta, the Princess Dowager of Wales, during whose possession, from 1751 to 1772, they gained their scientific character. Various persons noted in botany, in horticulture, and in garden architecture were employed, or concerned, in the extensive works, among them William Kent, Lord Bute, Sir John Hill, Sir Joseph Banks, and Sir William Chambers. The last-named designed and built most of the structures in the garden, from the temples and pagoda to the glass-houses, including the great stove (which still existed when the writer entered Kew in 1860), between the years 1758 and 1762. The Physic or Exotic Garden, according to Chambers, was not begun till 1760. This brings us to the date of William Aiton. He was born in 1731 at a small village near Hamilton, in Lanarkshire, aud in due course was "trained in the science and practice of horticulture," evidently beginning at the bottom of the ladder. In 1754 he left Scotland for London, and was soon engaged under the celebrated Philip Miller in the Chelsea Physic Garden, where he did so well that in 1759 he was recommended to the Princess Dowager of Wales as a competent person to take charge of the botanical collections at Kew. It is not clear whether there was a predecessor holding exactly the same position at Kew, but it is unlikely, because the building of the various stoves and greenhouses, including the orangery, was not completed before 1761. Aiton had excellent opportunities, of which he made the most, gaining for himself and Kew a European reputation. No expense seems to have been spared, and the best methods known were adopted in all the garden structures. Seeds, bulbs, and plants were sent to Kew from all parts of the world where Englishmen travelled. A little later, 1768–80, Cook's voyages were undertaken, and Sir Joseph Banks, who was attached to the first, began his numerous contributions, two Australian species of Casuarina being among the first. In 1772 Francis Masson was sent to the Cape of Good Hope to collect living plants and seeds for Kew, and he was highly successful, sending home such "a profusion of plants unknown till that time in the Botanical Gardens of Europe that Kew thereby in a great measure attained that acknowledged superiority which it now holds over every similar establishment in Europe." Meanwhile Sir John Hill, a prolific writer of

the period on botanical subjects, published in 1768 the first *Hortus Kewensis*, an octavo volume of 458 pages containing an enumeration of between three and four thousand species of plants cultivated at Kew. Sir John Hill's position in relation to Kew is uncertain, though probably honorary; but Thornton, the author of the *Temple of Flora* and other costly illustrated books, styles him (1799) the "First Superintendent of the Royal Gardens at Kew."

Until 1783 William Aiton had charge of the botanical department only, but in that year he was "promoted to the more lucrative office of managing the pleasure and kitchen gardens at Kew, which he was allowed to retain in connection with the botanical department, which he had before occupied." He lived in the house that is now occupied by the Curator and which was for a considerable period the official residence of the Director during the time that the establishment was in Royal occupation. His son Wm. Townsend Aiton died there in 1849.

In 1789 he published his *Hortus Kewensis*, or *Catalogue of the Plants cultivated in the Royal Botanic Garden* at Kew, consisting of three octavo volumes with thirteen coloured plates. This is an admirably concise work, and, although it was preceded by eight editions of Philip Miller's classic *Gardeners' Dictionary*, it was the foundation of the history of the introduction of exotic plants for cultivation in England. About 5500 species belonging to 1116 * genera are briefly described, with references to the most important botanical publications of the period, the native country of each species, date of introduction, and by whom introduced.

Hill's *Hortus Kewensis*, already referred to, is little more than a list of names with the shortest of descriptive phrases, so that we are almost wholly indebted to William Aiton for the record of information respecting the introduction of plants during and preceding his period.

In his preface Aiton says:—"Small as the book appears, the composition of it has cost him a large portion of the leisure allowed by the daily duties of his station, during more than sixteen years. In all that time it has been thought worthy the assistance of men more learned than himself." A second edition of the *Hortus Kewensis*, consisting of five volumes, was published between 1810 and 1813 by his son and successor.

Respecting the personal character and attainments of William Aiton, there is little on record, but what there is highly favourable. *Aitonia capensis*, named in his honour by Thunberg in 1776, is figured in the *Botanical Magazine* (1791), t. 173, and William Curtis, who doubtless wrote from personal knowledge, says:—"The great length of time Mr. Aiton has been engaged in the cultivation of plants, the immense numbers which have been the constant objects of his care, through every period of their growth, joined to his superior discernment, give him

* I have not verified these figures, which are taken from Frederick Scheer's *Kew and its Gardens*, and John Smith's *Records of Kew Gardens*.

a decided superiority in the *prima facie* knowledge of living plants over most Botanists of the present day. His abilities in the other line of his profession, are displayed in the eulogies of all who have seen the royal collection at Kew, which he has the honour to superintend."

Curtis, and many other botanical writers, state that *Aitonia capensis* was named by the younger Linnæus in honour of William Aiton. This is true, in a sense, because he actually described the same plant (*Supplementum Plantarum Systematis Vegetabilium*, p. 303) under the name *Aytonia capensis*. This was in 1781, five years after C. P. Thunberg had published it.

Aitonia capensis is a native of South Africa, where it ranges from Albany, in the East, to Little Namaqualand, in the West. It is a shrub of more botanical than horticultural interest, having a somewhat anomalous floral structure, in consequence of which it has been alternatively referred to the Sapindaceæ and the Meliaceæ. Its reddish flowers are succeeded by large, red, bladdery seed-vessels, similar in texture to the enlarged calyx of the winter cherry. Probably this shrub owes its wide distribution to the fact that the seed-vessel is easily dispersed by the wind. Speaking generally, the species of South African plants are very local.

Among the dried specimens in the Kew Herbarium is one preserved by Bishop Goodenough, probably from a plant grown at Kew, and labelled in the Bishop's handwriting, "*Aitonia honesta*, S. G.," *i. e.* Samuel Goodenough.

William Aiton died on February 2nd, 1793, in his sixty-third year, was buried at Kew, and among the pall-bearers were Sir Joseph Banks, Bishop Goodenough, Dr. Dryander, and Zoffany, the artist, who lived at Strand-on-the-Green. This is sufficient testimony of the high esteem in which he was held in different circles of Society. A funeral sermon was preached at Brentford by the Rev. W. Smith, from which we learn that Aiton was known and appreciated abroad as well as at home, as is proved by the following extract from the printed sermon :—"Not only was our friend universally known and esteemed in his own country, but his name and fame have extended to distant kingdoms, and to every quarter of the globe. I myself found them passports in various places abroad, and through his recommendation alone have been introduced to men of genius and science in foreign courts."

On hearing of Aiton's death, the Marchioness of Rockingham wrote to Sir James Smith in the following terms :—"I little thought five years ago that I could have felt so much concern for the death of Mr. Aiton; but I had not seen him then, and only looked upon him as the Kew gardener; but the single quarter of an hour he was with me occasioned an instantaneous conversion. I was quite charmed with the plainness of his manners, without a grain of that pomposity one might have expected; but on the contrary, quite pleasant and communicative in his profession; in short, he took my fancy so much that I cannot help

feeling infinite regret that so great and good a man in his line should now be no more."

In Kew Church is a mural tablet bearing the inscription:—

Sacred to the Memory of WILLIAM AITON,
Gardener to His Majesty King George the Third.
He died Feb. 2, 1793, aged sixty-two.

Flowers! that assembled from each foreign spot
Here bloom by royal aid, and bless your lot!
In circling rays a radiant glory frame,
Round this memorial of your Aiton's name;
His patient care, his pure benignant mind,
Rank and distinction to your tribes assign'd;
Will you permit no venal bard to bend
In just regret of Flora's buried friend;
Tis her's his living monument to raise,
Proof of his toil and herald of his praise,
Nor end the plaudits of his virtues here,
Those who embellish earth to Heaven are dear.

The lines are not good, but the intention doubtless was, and it is pleasant to be able to repeat here so much that is laudatory of the first botanical gardener of the Royal Botanic Gardens, Kew.

W. BOTTING HEMSLEY.

JOHN ROGERS.

Born at Richmond in Surrey on February 10th, 1752, and entering what were then known as the Royal Gardens, Richmond (but which now form part of the Arboretum at Kew), before he was out of his teens, John Rogers is one of the very first Kewites of whom we have any record. In 1838 he published his "Life and Reminiscences," a very interesting little book, from which we are kindly permitted by the present head of the family—Mr. A. C. Rogers of Southampton—to make the following extracts. To Mr. Rogers are also due the thanks of the Committee for the use of the two portrait blocks of William Aiton and John Rogers.

The latter writes:—"As soon as I was old enough I went to school at Richmond and afterwards to a Classical Seminary in Soho Square, London, the identical house in which Sir Joseph Banks resided. When about eight years old my father took me from Richmond to London to see the funeral of King George II. I returned by the only coach on the road at that time, and the reader can imagine what sort of a vehicle it was when I say the coachman always carried ropes and halters to tie up such parts of the coach as were likely to break down or come apart.

"My father having left it entirely optional with myself to choose the profession I pleased, I soon afterwards, from reading a work just then published, *Every man his own gardener*, by an old friend of my father's,

Aiton, William Townsend (1766–1849), *horticulturist*
by D. J. Mabberley
© **Oxford University Press 2004–14** All rights reserved

Aiton, William Townsend (1766–1849), horticulturist, was born at 199 Kew Road, Kew, Surrey, on 2 February 1766, the elder son of the horticulturist William Aiton (1731–1793) and his wife, Elizabeth (*c*.1740–1826), whose maiden name was possibly Townsend. He was educated privately in Chiswick and at Bower House school in Camberwell. Through the influence of Sir Joseph Banks he was apprenticed at the age of sixteen to his father; he also undertook private commissions as a landscape gardener. On the death of his father he succeeded the latter in the royal gardens at Kew, and on the resignation of John Haverfield the younger in 1795 those at Richmond. In 1804 Aiton took control of the gardens of Kensington and St James's palaces in succession to William Forsyth, and by 1827 he was styled—at his own suggestion—director-general of his majesty's gardens. He was held in high esteem by George III and the royal family, and conducted a confidential correspondence with the duke of Kent until the time of his death. John Nash consulted him over the planting scheme for St James's Palace and the Brighton Pavilion. He landscaped 40 acres at Buckingham Palace, uniting two small ponds into a grand lake, and supervised many extensive and important alterations at Windsor.

Aiton succeeded in getting his brother John appointed to the charge of the Hampton Court Gardens over the gardener to the duke of Clarence, but the result was the reduction of his own authority, on the duke's accession as William IV, to the charge of the Kew and Buckingham Palace gardens. Although he supervised the construction of a £6000 greenhouse at Kew in 1839, his management of Kew was severely criticized in John Lindley's report on the royal gardens: his reign was seen as one of procrastination, characterized by his failure to deal with correspondence and his lack of any clear policy. The gardens were transferred to the state and in June 1840 W. J. Hooker was appointed director, although only in November did Aiton agree to relinquish control. He surrendered his post on 25 March 1841, but retained the management of the pleasure grounds at Kew until 1845. He received a generous pension of £1000 per annum (Hooker's salary, by comparison, was £300, with a £200 housing allowance).

Between 1796 and 1802 Aiton published an edition of Franz Bauer's *Delineations of Exotick Plants* and in 1810–13 a second edition of 1250 copies of his father's *Hortus Kewensis*, in five volumes. The scientific content in the *Hortus Kewensis* is attributable to Sir Joseph Banks's librarians, Jonas Dryander and Robert Brown, who contributed much original work to the last two volumes. Aiton checked the dates of introduction of plants, of which over 11,000 are listed, and he also supervised production of an *Epitome*, in one volume, published in 1814. His papers and the draft of a second edition of the *Epitome* were burnt by his brother John, although part of the manuscript of the *Hortus Kewensis*, in the hand of Aiton's amanuensis, Richard Cunningham, survives at Kew, while Brown's drafts are at the Natural History Museum. Aiton's herbarium relating to the work, with Robert Teesdale's herbarium, which he had bought in 1805, were auctioned at his death.

His library, with that of John, was auctioned in 1851: Kew was forbidden to bid.

Aiton was elected a fellow of the Linnean Society in 1797 and was one of the founders and an active fellow of the Horticultural Society. To its *Transactions* he contributed a paper on the cultivation of the cucumber, for which he was awarded a silver medal in 1817. He died at 199 Kew Road, unmarried, on 9 October 1849, and was buried at St Anne's, Kew Green, where there is a plaque. His heir was his illegitimate son, William Atwell Smith (*b*. 1808).

Aiton, an able landscape gardener, was too inflexible to appreciate the changing role of botanic gardens, a role which Hooker understood and which was, paradoxically, promoted by Banks, Aiton's patron. His legacy is therefore largely in the royal gardens other than Kew and in the names of a number of garden plants commemorating him, one not yet relegated to synonymy being Robert Brown's name *Serruria aitonii* (Proteaceae).

and would have included autumn-raised annuals which flower the following spring or summer, but even this definition would not be exact, for it includes many tender perennials when grown in this climate, and possibly excludes some annuals. The truth is, the two classes merge into one another so gradually that it is impossible to draw a hard-and-fast line between them. For example, there is perhaps no plant that would be more certainly called an annual than Mignonette, yet under certain treatment it assumes the perennial habit, and becomes almost a shrub. It is largely a question of the conditions.

Nature's Layering Method.

May 15th.—Some of the Spruces have a remarkable habit of growth, the limbs extending outwards like huge candelabra, as in the specimen shown in the photograph. When these extending limbs touch the ground, they often root, forming independent trees around the parent; and so in time large groups may come into existence. In the Tropics there are, of course, many trees which multiply in this way, but in this country instances are rare.

H. C. DAVIDSON.

The Gardens at Babraham Hall, Cambridge.

INTERVIEW WITH MR. R. ALDERMAN.

THE gardens of Mr. Charles R. W. Adeane at Babraham Hall are a refutation of the theory that an ardent agriculturist does not take much interest in horticulture. The fine old mansion belonging to Mr. Adeane, whose herd of shorthorns and flock of Southdowns are famous in the agricultural world, is surrounded by pleasure grounds of many charms; while, as to the cultivation of fruit, it is a tradition, founded on a superstructure of fact, that Babraham Peaches and Nectarines can hold their own against any in the country; and Mr. Alderman, the present head gardener, has maintained their reputation by the success which he has achieved as an exhibitor. On my arrival at Babraham, which I visited in the middle of April, Mr. Alderman suggested that we should commence by devoting attention to the principal feature of the gardens.

"It is the outside fruit, then?" I said, as we inspected a tree of Lady Palmerston, with its pretty small flowers.

"Yes, the Peaches and Nectarines on the walls. Some of the varieties do even better outside than at Welbeck. This is a west wall. The coping is put up for protection in winter, but as soon as we are satisfied that there is no danger of frosts, it is removed. On this wall you see a fine tree of Dryden, a very useful Nectarine; Early Rivers, another Nectarine which does fairly well; and Sea Eagle, a Peach of which we grow a number. This tree is between six and seven years old."

"What is the tree with fruit so well set?"

"Humboldt Nectarine. We shall have to thin it tremendously. Here is another, Sea Eagle, and next to it is Princess of Wales Peach, of which we get fruit with a wonderful colour. But the sun is so hot that we sometimes have to shade the wall. In this very warm corner we have a tree of a Peach not generally grown —Desse Jardine."

"When does the fruit ripen?"

"It is a mid-season Peach. The fruit is very fine, and we have had some great crops off this tree, which was planted about eight years ago."

"Why do you go in so largely for Sea Eagle?"

"Because it does particularly well. It has a very strong constitution. We have gathered fruits weighing three-quarters of a pound off some of the trees."

"Is Violette Hative one of your Peaches?"

"Yes, and it is doing extremely well. Lord Napier is a good variety of Nectarine, and the adjoining tree of Barrington Peach, though very old, bears very good crops. Crimson Galande is a beautiful Peach, with fine flavour, and amongst the late varieties Walburton Admirable holds a high place in our regard."

BABRAHAM HALL, CAMBS., FROM THE GARDEN.

MR. ALDERMAN.

A Fine Late Nectarine.

"Here," continued Mr. Alderman, "is a very good late Nectarine, Victoria, which has a delicious flavour. Some people say that it is improved by being grown under glass, but we have them towards the end of August as good as could be desired, except that they have not much colour. Late Admirable is one of the best of the late varieties of Peaches."

"Which is your earliest Peach?"

"Decidedly, Waterloo, an American variety, which is ready early in July. You see we do a lot of netting. It is necessary, in order to keep the birds off. The bees fertilise all the fruit."

"Do you root-prune the trees often?"

"Every season. We also give them every season a small quantity of sweet, fibrous loam."

"You have another fine tree of the Nectarine Dryden?"

"Yes, it covers a lot of ground. Near it is a tree of Gladstone, which was only transferred to this spot in the winter. Gladstone is a Peach succeeding the Princess of Wales, large, and of good colour and flavour."

A Little-grown Peach.

"Do you shift many fruit trees?"

"We are always moving them It is very important to get at the bottom as well as at the top of the trees. Now, we come to another Peach which is not very often grown."

"What is its name?"

"Teton de Venus. It is a very free cropper, and the fruit is distinctly handsome. Other varieties on this wall include more of Princess of Wales, Barrington, and Lady Palmerston.

Digitized by Google Original from CORNELL UNIVERSITY

Here, also, is Nectarine Byron (a late large orange variety), and Rivers' Early Orange."

Eight Hundred Dozen Fruit.

"Can you tell me how much fruit you pick in a good season off the Peach and Nectarine trees on the walls?"

"About eight hundred dozen. We begin to gather early in July, and go on to the end of October. You will see what we do under glass presently."

"To proceed with the walls, I notice that you are well supplied with Plums?"

"Yes, there is a representative collection, including a nice lot of the old English Greengage, which, I think, still surpasses every other Plum in flavour. Reine Claude de Bavay and Transparent Gage are two of the best dessert varieties. One of our most healthy trees is a Jefferson, and Washington is making a lot of wood. Other good varieties are Grand Duke, Pond's Seedling, Large Black Imperial, Monarch (a big cooking Plum), and Coe's Golden Drop, of which we have three fine trees."

Apricots and Cherries.

"What about Apricots?"

"There is a wall devoted entirely to Apricots. It was planted three years ago with Moor Park (which is the best Apricot) and Rivers' Early (a new variety). Apricots do not thrive like Peaches."

"Do the conditions suit Cherries?"

"Morellos on a north wall are doing well. Then there are the Pears on cordons on the walls, which we grow for showing, in addition to many others."

"Where are the others grown?"

"In a plantation, ten acres in extent, in addition to the kitchen garden, where a quantity of Pears and Apples on pyramids and bushes are grown. There are no standards. I suppose we have about fifty varieties of Pears."

The Best Six Pears and Apples.

"Will you give me the names of the best half dozen in their order of merit, as you find them?"

"Doyenne du Comice, Pitmaston Duchess, Louise Bonne of Jersey, Madame Treyve, Fondante d'Automne, and Durondeau. Others on the walls only that are particularly at home are Rivers' Magnate (a beautiful Pear), Winter Nelis, Marguerite Marillat, Glou Morceau, Clapp's Favourite, Nouvelle Fulvie, Beurre Baltet Pere, Beurre d'Amanlis, and Seckle, the last being Mr. Adeane's favourite Pear."

"How many varieties of Apples do you grow?"

"Quite a hundred. The best in cultivation is Lane's Prince Albert, and next, of cooking Apples, are Newton Wonder and Bramley's Seedling. The three best dessert Apples are Cox's Orange Pippin, King of the Pippins, and Blenheim Orange."

"You have a fine batch of Strawberries coming on."

"They are all Royal Sovereign. We force about fifteen hundred, and, although I try all the new varieties, I have never found one yet to come up to Royal Sovereign. No doubt it does exceptionally well on our very light land. We crop the plants three seasons. Other varieties grown are Waterloo, Exoniensis, and Givon's Late Prolific. All the latest varieties of Gooseberries and Currants, which we protect by netting, are grown."

THE GARDENER'S COTTAGE AT BABRAHAM HALL.

An Informal Herbaceous Border.

"While fruit adorns your walls, you do not neglect to decorate your kitchen garden with plenty of flowers. I have seen it a blaze of colour."

"You are referring to the herbaceous border at the end, which can be seen on the other side of the Granta—the river running past the garden. The principal plants in the border are Mallows, Larkspurs, Michaelmas Daisies, Candytuft, Verbenas, Achillea ptarmica (white), Asters amellus bessarabicus, Thomsoni, Osprey, White Spray; Phloxes Agnes, General Roberts, Mrs. Anderson, Etna, Marquis, Maggie Forbes, with Rudbeckias in variety, and Hollyhocks at the back. There is nothing in the least formal about the border, but the principle is to grow big clumps of colour."

How to Treat Hollyhocks.

"Have you any trouble with Hollyhocks?"

"No, because we grow them fresh every year. This is the only way to ensure immunity from pests. Holmes' Magnificent is a soft yellow, and we match it with a good scarlet. We are going to cover the end wall with Honeysuckle and Clematis, in order to make it both fragrant and beautiful. Before we go into the little Rose garden, which adjoins the kitchen garden, I may mention that we have a good collection of Border Carnations, the best being Duchess of Rothesay, Lady Hermione, and Lord Roberts."

"Your Rose garden, with its stone paths and moss and rock plants intersecting, has other charms than Roses. I allude to the glorious mass of golden flower on the side wall of the summer-house."

"Yes, that is a nice specimen of Forsythia suspensa, which has been in bloom for a week, and will last a couple of weeks longer. It was planted three years ago. We are covering the front with Wistaria sinensis."

"Are the Rose beds mixed?"

"No, they are in one variety, the varieties

GOLDEN QUEEN LETTUCE READY FOR CUTTING, AT BABRAHAM HALL.

Digitized by Google Original from CORNELL UNIVERSITY

being Catherine Mermet, Caroline Testout, La France, and White Maman Cochet."

Lettuce Nine Months in the Year.

Passing the frame ground, and noticing in one of the pits some nice fruits of Royal Sovereign Strawberry, which Mr. Alderman began to gather at the end of March, I asked about the Cucumbers.

"The best all-round variety is Rochford's Market, and other good varieties are Sutton's Pride of Market, Delicacy, and Carters' Best of All. We have no French garden, but we grow French Lettuce, and cut Lettuce nine months out of twelve, using Endive for the three remaining."

"When do you sow your first batch of Lettuce?"

"At the end of February, and plant out in frames about the end of March. We find that Veitch's Golden Queen and Early Paris Market force better than other varieties. Later we grow chiefly Paris White Cos and Veitch's Superb White."

"Do you go in for early Potatoes?"

"Our first-early is Duke of York, with Table Talk for the second, and Tyne Kidney for the main crop. The principal Peas are Carters' Daylight and Carters' Early Morn."

Violets and Chrysanthemums.

"Then you have a large number of Violets in the frames."

"Yes, they are rather a speciality, and do well on a north border. We grow Marie Louise, Parma, Mrs. J. J. Astor, Princess of Wales, and Californian. We are just getting our Chrysanthemums potted up."

"How many?"

"About six hundred. The best for large blooms are F. S. Vallis, F. W. Vallis, Miss E. Fulton, Beatrice May, Bessie Godfrey, Mermaid, W. R. Church, Madame R. Oberthur, General Hutton, Edith Smith, Mrs. C. Crooks, and Ethel Fitzroy."

A Combination of Blue and White.

"You have a fine show of flowers in your stove?"

"The Hibiscus which covers the walls is always in flower. There are two varieties, claret and salmon-coloured, and the great number of blooms render them very ornamental. We feed them a little with cow manure. Gardenias are very popular, but I am retarding them, so that they may flower in May. The variety is G. florida. We get a pretty contrast of blue and white colour from the Browallias and Primula stellata. The treatment of Browallias is stove rather than greenhouse, and they can be flowered better from seed than from cuttings. Practically the only Orchids grown are Calanthes Veitchii and Cœlogyne cristata."

"Schizanthus seem to be prominent in your flowering house."

"We grow a great quantity of it, because, in addition to its usefulness in the mansion, we find it valuable in decorating the church. For three or four years I have saved my own seed. I do the same with Cyclamen, of which you see we have a number of salmon-pink; also Amaryllis, of which I had several beautiful flowers this season. Zonal Pelargoniums are another feature, and we grow about two hundred Malmaison Carnations."

Standard Heliotropes.

"Then, there are your standard Heliotropes?"

"We get them a good height, and I think Lord Roberts is about the best variety. We bring them inside when the frost comes, treat them with gentle heat, and then they grow very rapidly."

"Do you get good crops of Grapes in your Vineries?"

"Extremely good. The varieties are Muscat of Alexandria, Black Alicante, and Black Hamburgh. The trees are only eight years old, and the border inside."

"What are the varieties in your Nectarine house?"

"Precoce de Croncels and Early Rivers. From the first of these trees we gathered last year fifteen dozen fruits, and from the second fourteen dozen. In the Peach house, where the trees carry about the same quantity of fruit, are Rivers' Early York, Crimson Galande, and Hale's Early. In the Fig house, Brown Turkey does well."

"You do not cover the back walls of your fruit houses?"

"No; I think it better to keep them uncovered, and certainly the crops point to the conclusion that it is good policy. There is one feature of the kitchen garden which you might like to mention—I mean a double border of Japanese Pæonies."

"Grown in clumps?"

"Yes, and comprising, amongst other colours, pink, white, and salmon. They are at their best in July. With regard to treatment, it is good policy to grow them entirely by themselves. The only feeding required is a little weak liquid manure-water occasionally."

The Italian Design.

We then proceeded to the vicinity of the mansion, noting, as we approached, a little, old-fashioned English garden, with dwarf plants between the stones of the paths. Here Daffodils were flowering, and will, later on, be succeeded by many varieties of Pansies.

"Other contents of this garden," said Mr. Alderman, "are clumps of Rosemary, Foxgloves, and Lavender, with Brier Roses surrounding a centre of Laurette Messimy, and, at the back, Crimson, Carmine and other Ramblers. Further on, in the spring border, with the Rambler Roses at the back, are Grape Hyacinths, Anemones and Scillas. As to the mansion itself, the French Roses on the verandahs, with Myosotis underneath, are a feature; and later on we add different varieties of sweet-scented Geraniums and Nicotianas."

"Your only formal bedding seems to be the Italian design on the other side of the mansion."

"Yes, and, as you notice, the whole of the beds are scarlet and white Tulips, which will be followed by scarlet Geraniums, chiefly Henry Jacoby, Paul Crampel, and Vesuvius. For these beds we grow about five thousand scarlet Geraniums, and the effect when they are all in flower is very fine."

Roses and the Rockery.

"Have you anything special in the conservatory?"

"At the present time, Schizanthus and Geraniums, with pretty foliage, occupy most of the space. On the grass at the side you notice in one bed a number of clipped Yews, and in another a dozen specimens of Box planted together, which, I believe, date back many years."

"Which do you consider the most notable trees on the lawn?"

"The Copper Beech, feathered down to the ground, further on a very fine Fern-leaved Beech, and also the Cedars. In the sunk Rose garden, the large bed is filled entirely with La France, the four round beds with a little French cluster Rose, and the four corner beds with Caroline Testout."

"Have you many varieties in the rock garden running close to the old-fashioned summer-house?"

"There are a number of seedlings, which we had from the late Sir Michael Foster's garden; but the varieties now in flower are chiefly Aubrietia Dr. Mules, Alyssums, Madwort, and double white Arabis."

"How long have you been at Babraham, Mr. Alderman?"

"Nine years in August. I started my gardening career at Burghley House, Stamford, under Mr. Gilbert. I was afterwards for a time at Lord Rosslyn's place; next I spent three years and a half at Garbrand Hall, Surrey; and then for eight years I was foreman at Welbeck."

ALFRED WILCOX.

The Ideal Garden.

IV.—THE ART OF DESIGNING.

BEFORE commencing to treat, as it is my intention to do, of the ideals on which each feature of the garden should be modelled, it would be well to state a few of the principles of designing. Here I wish it to be understood that I do not necessarily mean the formation of a garden in strict conformity to the run of the rule or the swing of the compass In the planning of gardens there are two schools—one insists on the beauty of symmetrical outline and the dignity of straightness, while the other inclines to disallow any line which possesses either of these properties. These, of course, are the extremes, and, as in most other walks of life, these extremists are wrong. The sensible, practical man endeavours to combine the good points which undoubtedly exist in both systems.

Personally, I incline more to the laying-out of a garden on natural lines, which means, almost invariably, nonconformity to rule or compass. But because I love natural scenery, and wish a garden to be an epitome of natural beauty, I cannot be blind to the beauty which is often associated with a formal garden. The whole idea of formality need not be entirely eliminated from the plan of the natural garden, for often the formality is so unobtrusive, and the furnishing of the beds so artistically performed, that the idea of symmetry of outline is lost in the admiration provoked by the undeniable beauty of the plants and flowers. It must be regretfully admitted that the rail against formality is often used as a cloak for incompetence, or, at any rate, negligence. Now, while I do not advise the formation of a heavy, symmetrical design, I do insist that, where such a design already exists, and is likely to remain, every effort should be made to so emphasise the beauty of the flowers, by appropriate furnishing and artistic blending of colours, that the monotony of regularity is well nigh forgotten. I know this is difficult, but it is a noble endeavour.

The Only Safe Method.

Now that we are at the beginning of the attempt to call into actuality an ideal garden, I must lay it down as essential that a plan of the garden be made. Contrary to the opinion and advice of many "practical" men, it is really the only safe and reasonable method. Just as every builder must have a plan of the projected building, so should every gardener have a plan, drawn to scale, of the garden he is to make. Now, in the formation of the plan, the first item, following the setting-off of the boundary, is to decide what are the main features to be included. The factors governing the choice of these will necessarily be, for the most part, individual and local. The desire to include a certain feature may be negatived by the fact that it could not be suitably arranged. Again, all the conditions necessary to form a certain feature in an ideal manner may prevail, and yet the owner's taste may not incline to that direction, and to include a feature which will not prove of interest to the one on whom its maintenance will ultimately depend, is not a policy to be recommended.

When, however, it has been decided what are the main features to be included, the ideal place for them will have to be found, and roughly marked out on the plan. A Rosery, a water garden, a pergola, a vegetable and fruit plot, a rootery, a conservatory, a rock garden, may each or all be included; but to find the place for them, such as is ideal in itself, and will admit of all the features being well associated and blended, so that they fit in with each other and with the house, is a task of no small magnitude. As we proceed, I hope to point out the special requirements of each of these, in order to approach the ideal, and every endeavour must be made to fulfil those requirements.

Presuming for the moment that these features are fixed, we have to consider the best means

ALDUS JOHN 1 [10]

Gardener

fl. 1741-1767

A free burgess voting in 1741 for Savage and Gray and in 1747 for Nassau and Gray. Was steward at the annual Auricula Feast at the Castle Inn in 1754 (*Ips]* 4 May 1754). He died in 1767 and his wife and son advertised as follows:-

> Whereas JOHN ALDUS, gardener and Nursery Man, lately dwelling on EAST HILL in COLCHESTER, is now deceased. This is to acquaint those Gentlemen that used to favour him with their Custom, and others, that the business will be carried on by the Widow Aldus and her son John Aldus (qv); they hoping that such their friends will continue their favours to them, and may depend upon having their commands, duly expeditiously and carefully obeyed.... They have a great variety of choice Fruit Trees, as Peaches, Nectarines, and Apricots; with Apples, Pears, Cherries, and Plumbs, and all other sorts of Fruit Trees; fine young Virgin Quick, and Box for Edgings, & many Sorts of Evergreens, likewise a large Number of Mulberry-trees; all which are to be sold at a reasonable Rate (*Ips]* 31 January 1767).

VOL. LIII.—No. 2,943. SATURDAY, MARCH 26, 1910.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Horticultural Lectures.

With the opening days of spring the winter session of the numerous gardeners' associations will have drawn to a close, and the committees will, if they are wise, be giving attention to the preparation of the programme of the meetings that will be commenced shortly after the cessation of the summer's activities. Hence some reference at the present time to this important matter can hardly fail to prove useful, especially to those who are desirous of avoiding a slavish adherence to traditional methods of procedure. In many instances the consideration of the programme is deferred until within a comparatively short period of the inaugural meeting of the session, but there are several objections to such delay. In the first, the members of the executive will not have six months afterwards so clearly in their mind the weak and strong features of the session as at its close, and therefore will not be in a position to so fully appreciate the desirability of making such changes in methods of procedure as are essential to the maintenance of the meetings at a high level. By commencing the preparatory work now there will be less difficulty in obtaining papers and lectures from horticulturists living at some distance beyond the sphere of the society's operations. As regards readers of papers resident in the district, the additional time will be a distinct advantage, as it will give them fuller opportunities for thinking out the details of their subjects previous to committing their thoughts to paper. There is the further advantage in commencing early, of being able to bring the programme before those who are interested in gardening well in advance of the opening meetings. Whether the programme should be wholly filled by members, or include several lectures given by prominent horticulturists, is a question that must be determined by the circumstances of each case. There are not wanting those who believe that the first of the two methods is preferable. From long experience of the work of gardeners' societies we are fully persuaded that the best course is to include in the programme of each session the names of a few prominent horticulturists who reside outside the district. They may not be more successful cultivators or better speakers than some who reside within the district, but the occasional visit of a stranger quickens the interest in the meetings, and he will, more often than not, state his views upon some particular subject in a quite different manner than that to which the members have become accustomed. If the societies are to fully accomplish the work of which they are capable, the adoption of the second of the two courses of procedure is imperative. The time has gone by when the whole of the meetings should be given up to the discussion of subjects of a severely practical character. Science, as well as practice, should have full recognition, and in each session about one-third of the papers and lectures should be on scientific matters having a direct bearing on horticulture, and these should be by recognised authorities on the respective subjects. The formation, composition, and amelioration of soils, the science of manuring, plant growth, hybridisation and cross-fertilisation, fungoid diseases and insects injurious to plant life, are subjects of much importance to those engaged in garden management, and if dealt with by those fully conversant with them will be of intense interest. The great industries that appeal to gardeners, such as the daffodil industry, the tomato industry, and the grape industry should also receive attention, and if they are dealt with by those who are well acquainted with what is in progress, both at home and abroad, the meetings will be profitable as well as interesting. At least two evenings of the session should be set apart for an account of the chief gardens in the district, or of great gardens in other parts of the United Kingdom, including, if so desired, the botanical establishments. Not so long since the Croydon Gardeners' Society devoted an evening to an illustrated lecture on the gardens of which Croydon is the centre, and it was regarded as one of the most successful of the many admirable meetings which this enterprising society has held. Before societies can carry out programmes of so comprehensive a character as here suggested it will be necessary for them to have greater financial strength than is usually considered sufficient. They should certainly follow the example of the Croydon Society, and provide themselves with a good projection lantern, as slides are a necessity for many of the subjects mentioned. They will be found useful for many others, and, if some discretion is exercised, they will add much to the interest of the meetings. The lantern should be a good one, and adapted to the place of meeting and the method of illumination available, but the cost of purchase will not be so large that the amount cannot be raised without special difficulty, provided the necessary enterprise is forthcoming. It was found at Croydon, as will be found elsewhere, that the owners of gardens readily contribute to the fund raised for the purchase of the lantern. Illustrated lectures invariably prove the most attractive, especially when the members include a considerable proportion of amateurs, but it should be distinctly understood that the slides should be used to elucidate the remarks of the lecturer rather than to hide any defect he may possess as a speaker. The financial aspect of the work is not disposed of by the purchase of a lantern. The payment of lecturers on special subjects will have to be considered, and, with reference thereto, we would point out that it is unreasonable to ask someone who has obtained a prominent position in the world of horticulture to lecture without fee, and, more often than not, to allow him to be

MR. E. J. ALLARD.

out of pocket to the extent of his travelling expenses. It is, of course, a different matter in the case of members, and of those resident in the same district, as they may be assumed to be sufficiently interested in the success of the society to be willing to render it assistance. Demonstrations of horticultural practice and of floral decorations should have a more prominent position in programmes than is usually assigned them, for they are especially useful to young gardeners, and of interest to those who are no longer young.

Mr. E. J. Allard, whose name is familiar to our readers by reason of his writings and the many reproductions from his plant portraits that have appeared in these pages has, as we have already announced, just taken up the very important post of garden superintendent at the John Innes Horticultural Institute, at Merton, of which Mr. Bateson is the director. Mr. Allard commenced his gardening career in a private establishment, where he had a good grounding in the general routine of garden practice. He then spent a few months in a nursery, and eventually entered service as an improver at the Cambridge Botanic Gardens, under Mr. R. Irwin Lynch, M.A., where he added greatly to his experience and knowledge of plants. From Cambridge Mr. Allard went to Kew, where the large plant collections, library, practical work, and courses of lectures further enabled him to add to his knowledge and widen his experience. From Kew Mr. Allard returned to Cambridge Botanic Gardens, where for five and a-half years he was foreman of the indoor department, this period being followed by one of five years as foreman of the outdoor department of the same establishment. Mr. Allard has had a good deal to do with the experimental work carried on at Cambridge, and took an active part in the work of plant breeding there, and doubtless this experience will also be of great value to him in his new duties. What force the John Innes Horticultural Institute is to exert upon the horticultural world depends largely upon the lines of development Mr. Bateson lays down; he has certainly an able lieutenant in Mr. Allard, who has our heartiest wishes for a successful career.

Haarlem Jubilee Flower Show.—The first of the series of horticultural exhibitions arranged by the General Bulb Growers' Society of Haarlem for the celebration of its jubilee was opened on Wednesday, March 23, under the most favourable auspices. The exhibition is being held in Hertekamp Park, one of the public parks belonging to the city, and a more delightful place for the holding of flower shows it would be difficult to imagine. It is extensive, finely wooded, and convenient of access, and the greater part of its area has been converted into a veritable flower garden that will be rich in attractions during the next two months. Just now it is gay with crocuses, and these will be followed by daffodils and hyacinths in variety, and a wide range of tulips in which early, mid-season, and May-flowering varieties are fully represented. The contributions to the first of the temporary shows are arranged in four spacious structures that are equally remarkable for elegance of design and suitability for the purpose for which they have been erected, the lighting being particularly good. Within the several exhibition houses there is an exceptionally fine display, hyacinths, tulips, mollis azaleas, rhododendrons, and lilacs being especially noteworthy. British horticulturists are in strong force, and among those who answered to their names when the jury was called on Tuesday morning last were: Mr. J. F. McHattie, of Edinburgh; Mr. G. Cuthbert, of Southgate; Mr. Walter Ware, Bath; Mr. C. E. Pearson and Mr. Duncan Pearson, of Lowdham; and Mr. George Gordon, Kew.

The Crush at the Horticultural Hall.—In order to avoid a repetition of the crush that occurred on the occasion of the R.H.S. meeting of March 8, direction posts were set up in the hall on Tuesday last, indicating the route visitors should follow, and, in addition, every visitor was handed the following notice: For your own comfort as well as for that of others, you are entreated to turn to the right immediately on entering the hall and keep stedfastly to the right, thus making the entire circuit of the hall, along the walls, first; and then proceeding to the central tables, still keep up and down to the right.

Vandalism at Camberwell.—The fact that a fine chestnut tree has been cut down in Camberwell Grove, for no apparent reason than the provision of work for the unemployed, and that the plane trees in Grove Park have been hideously lopped, though still young, is causing a great deal of anxiety on the part of tree lovers, for these things appear to have been done under the direction of the Borough Council, and not under the advice or guidance of anyone with a knowledge of arboriculture.

Herbert Park, Dublin.—A premium having been offered for the best design for the laying out of Herbert Park, Dublin, the site of the recent International Exhibition, a large number of designs were submitted, and that of Messrs. J. Cheal and Sons, landscape gardeners, Crawley and London, has been accepted, and the premium awarded accordingly.

Rothamsted Report for 1909.—The annual report for 1909, from the Rothamsted Experimental Station, Harpenden, with the Supplement to the Guide to the Experimental Plots has reached us, and shows that the staff under the direction of Mr. A. D. Hall, M.A., F.R.S., has been exceedingly active during the past year in the investigations of matters of great interest to agriculturists and also to horticulturists. Special subjects investigated and briefly referred to in the report are "The Effect of Partial Sterilisation of Soil on the Production of Plant Food," "Direct Assimilation of Ammonia Salts by Plants," "The Development of the Grain of Wheat," "The Amount of Free Lime and the Composition of the Soluble Phosphates in Basic Slag," and "Estimation of Calcium Carbonate in Soils." In connection with partial sterilisation, it is stated that the heating or treatment of soil with antiseptics kills off the protozoa and amœba which live on soil bacteria, and thus keep down their numbers, but it leaves unhurt some of the spores of the ammonia-producing bacteria which afterwards can develop to a much greater extent because freed from this normal check. Soil partially sterilised by being heated to 100 degrees for two hours is said to give a marked increase of crop.

Proposed Gardeners' Congress.—Mr. J. Weathers writes: "It has been suggested that the time has arrived when the gardeners of the United Kingdom should meet together to discuss matters affecting their interests and profession. The chief difficulty in the way of this is to select a day and a time that would be convenient to any very large number, but probably the first day of the Holland House Show at Kensington—that is, on Tuesday, July 5 next—would be as good a day as any to secure a meeting of representative gardeners from various parts of the kingdom. Gardeners generally are beginning to feel that unless they co-operate in some way, the best positions in their calling are likely to be filled by men who have had no horticultural practice or experience. If gardeners in sympathy with the idea of holding a conference will kindly send their name and address to me at Talbot Villa, Isleworth, I think I may say that the Executive Council of the British Gardeners' Association will be only too pleased to co-operate and to defray the expenses."

Royal Botanic Society.—At a meeting of this society, held on Saturday, March 19, Mr. Pembroke S. Stephens, K.C., presided. Fifty-four new Fellows were elected and sixty-one nominated for ballot at the next meeting. Since the beginning of the year 181 new Fellows have been elected and proposed, this constituting a "record" for the society.

The Elm Avenue at Battersea Park.—Mr. V. Cockram, secretary of the London Branch of the B.G.A., writes that the central elm avenue at Battersea Park is being destroyed by a disease more deadly than the woodman's axe, and one which is beyond the power of man to prevent or cure. The trees have fallen a prey to the attacks of such parasitical fungi as Polyporus Ulmadia and P. sulphureus. These parasites have found a lodgment in the bark and the fungus has eaten its way through the fibres of the branches, and so weakened them that they are apt to fall without warning, especially when the leaves are heavily laden with rain. It will thus be seen that the trees have become a source of danger to the public, and it is only necessary to recall the fatal accidents which occurred in Kensington Gardens some time ago to realise how serious the danger really is. It is on this account that the authorities have reluctantly had to condemn the beautiful elm avenue in Battersea Park and have the diseased and dangerous branches removed.

Crocuses at Uttoxeter.—From Mr. J. Marston, gardener to H. Ford, Esq., The Hall, Uttoxeter, we have received two photographs of the crocuses in flower under a fine old beech tree in The Hall gardens. The photographs are not suitable for reproduction, but they indicate what must be a delightful scene at this season of the year, and are something like that to be seen at Kew or in Regent's Park.

Rehmannia Briscoei.—At the recent meeting of the R.H.S. Scientific Committee, Mr. Harry J. Veitch showed a hybrid between Rehmannia angulata (of commerce) and R. Henryi. The hybrid had been raised by Mr. T. W. Briscoe, after whom it was named. The parents were also shown, for comparison. The hybrid was in most characters intermediate between its parents, being dwarfer than angulata and having an erect inflorescence instead of a condensed one, as in the pollen parent. The flowers were intermediate in colour and of a soft, pleasing pink. The leaves were arranged in a rosette, and were similar in shape to those of R. Henryi and had the same dark veinings, while they were much more velvety-hairy than those of R. angulata, though a little less so than those of R. Henryi. A Botanical Certificate was unanimously recommended for Rehmannia Henryi, now for the first time exhibited, and a Certificate of Appreciation was unanimously recommended to Messrs. J. Veitch and Sons for work in connection with the raising of this interesting hybrid.

Hoisting the Red Flag.

February 8th.—There is a superstition among gardeners that birds are afraid of a red flag. It dates back, I fancy, to pre-railway days, otherwise one might suppose that some inquiring bird had been studying the signal code. In what other direction, then, must we look for the origin? A red flag, I believe, has an irritating influence upon a bull, but, then, a bird is not a bull. Moreover, the latter makes straight for the flag, for which reason I have not tried the experiment myself. The choice of flag to frighten birds with is certainly curious, for that is the colour with which plants adorn their fruits for the very purpose of attracting them. And that it does not frighten them is easy to show. I have seen the thrushes, blackbirds, and starlings swarming in a Cherry tree bristling with red flags, and on my lawn, where I have made a putting green, with a flag in every hole, the birds are quite as numerous as they used to be. It is very amusing to watch them when the dog's dinner-bowl is put out. They stand about in dozens waiting their turn, and then, when their time comes, crowd round, the sparrows on tiptoe with their heads hanging over the bowl, eager to begin, but afraid, leaving the possibly dangerous task of getting the grub out of the bowl to a more daring chaffinch or robin. Their methods of feeding differ widely. The robin ducks at its food, and up again, like a lady bathing; the starling goes steadily on; the chaffinch spends much of its time in trying to drive other birds away; the crows are equally busy in robbing one another. Probably, in the struggle for existence, they may have found this trait useful, for if they prefer food which has first been tasted by some other bird they are much less likely to be poisoned.

Mr. William Allen.

February 9th.—At this season, when a fairly high temperature is often necessary for propagating purposes in the greenhouse, any defect in the heating apparatus makes itself unpleasantly conspicuous. A boiler should always be above rather than under its work. It will then maintain the desired temperature with less attention and with inferior fuel than it would otherwise do. For every thirty-five feet of 4-in. pipe there ought to be one superficial foot of heating surface—that is, of boiler in contact with the fire. Coke or anthracite, when quite small, is far better than ordinary coal, but house cinder ashes may also be used with advantage. When the water contains lime, there is always trouble from incrustations. In such cases only the simplest form of boiler, without tubes or anything of the sort, should be used, and it should be so constructed that it can easily be cleaned.

February 10th.—It is to the woods that we should go if we want hints for making our shrubbery. There, where the trees stand shoulder to shoulder, rising out of a dense growth of Ferns or spring-flowering bulbs, with their branches meeting overhead, and here and there a wild Rose flung aloft, to fall in sprays of pink, we may see the pergola as Nature made it, and upon that Art can improve but little.

H. C. Davidson.

Famous Gardeners at Home.

No. 227.—Mr. William Allen, at Normanhurst Gardens, Battle.

It is not easy to realise that Mr. William Allen has been head gardener at Normanhurst for thirty years. When I saw him in mid-December, on my arrival at the gardens attached to Lord Brassey's picturesque seat in Sussex, he was looking as fit and vigorous as the average man between thirty and forty. His only regret in connection with my visit was that it was not made in summer. But I was, happily, soon able to convince him that on a misty December day, yet not too misty to see the beauty of my surroundings, I could appreciate the charms of gardens as well as in the full glory of June sunshine. Indeed, at no season would Normanhurst be otherwise than attractive, if only because of the trees and shrubs which are one of the principal features. Some of these I noticed immediately we commenced our walk past the gardener's pretty cottage, near which is a water tower with a tank which holds about eighteen thousand gallons. Here, on the high wall overshadowing a long, herbaceous border, are Pears on cordons, and others horizontally trained, while facing the stables, which are hidden by trelliswork, I observed a nice specimen of Sequoia sempervirens. A little further along the main road to the mansion we came to one of the fine examples of Pinus insignis, which, as Mr. Allen said, seem to enjoy the air of the sea, not more than six miles distant.

"There are also," he continued, "a number of white Birches in clumps, which are very pretty in the spring and autumn. They are the real natives."

"Hollies also seem to be at home here?"

"Yes, especially the golden. The soil suits them, and we have taken care that they have not been smothered. We cut the loose branches off and make the trees break back."

Bamboos in Variety.

"Does the soil suit your Bamboos?"

"Yes, remarkably well. The clumps of Bamboos and British Ferns which you see at this point are on the site of an old duck pond. The Bamboos are in variety, but are chiefly metake. The variety of Pampas Grass, Gynerium argenteum, which is above nine feet high, stands all weather well."

"And Rhododendrons?"

"They also do exceedingly well. There is peat in the soil, and no lime. We have acres of Rhododendrons, chiefly ponticums, of which a fine view is obtained from the terrace. Tree Pæonies and Azaleas also appreciate the soil."

"Another of your features appears to be Laurestinus?"

"We have them in flower eight months out of twelve all over the grounds. Both the climate and the soil suit them, and if frost cuts the flowers off for a time, there are always more to take their place."

"Of the very numerous trees and shrubs which I notice all over the gardens, you might mention some others that do particularly well."

"The varieties of Abies are conspicuous amongst these, notably A. Nordmanniana, A. lasiocarpa, A. cephalonica, A. Menziesii (the latter, grown in a moist position, is a grand tree), A. morinda, A. tsuga Albertinia (a great feature here), and Abies Douglassii, which grow and look well up to about seventy feet high, or as long as it has the advantage of a surrounding shelter. Above that point it cannot stand the west gales, but goes off at the top. Cedrus atlantica and C. a. glauca are also conspicuously good, and Libocedrus decurrens (the Tuxense Cedar), although rather formal, makes an excellent distinction in a number of trees and shrubs. Araucaria imbricata also does well, and the same may be said of Thujopsis dolabrata variegata and T. gigantea, as well as of T. borealis."

The Terrace.

As we ascended the front terrace, from which, on a clear day, Hastings, Bexhill, and Eastbourne, as well as some lovely scenery, can be seen, I noticed, beyond the lawns underneath, a pretty rustic bridge, with a quantity of water, and Mr. Allen said, "The lakes, which wind round for upwards of half a mile, with breaks, were made eighteen years ago by Lord Brassey to provide work for numbers of men in the locality who were out of employment."

"Who designed the pleasure gardens?"

"The late Mr. Thomas, a famous landscape gardener. The pleasure grounds and kitchen garden extend from twenty-five to twenty-six acres."

"What have you planted for spring in the borders right round the terrace?"

"Primroses, Pansies, Crocus, and Daffodils, which will be followed in the summer by herbaceous plants. The front border is ten feet wide and a hundred and twenty feet long, and the side borders seventy long and ten wide. We follow the spring flowers with annual plants, chiefly Phlox, and Veitch's strain of Petunias."

"You have a very large Ampelopsis Veitchii on the mansion."

"You ought to see it in September when it is at its best. It is seventy feet high, and about the same broad. There are also Ivies on the mansion, and on the new addition to the frontage are Crimson Rambler Roses."

The Gardener's Cottage at Normanhurst.

The Grotto and the Grove.

Below the mansion there is a charming grotto containing a natural formation of stalactites, which is covered outside with Wistaria sinensis, Roses, and Clematis, Ferns flourishing inside. Leading on to the golf links is a fine flight of

steps, which are planted below with Jasminum and Ceanothus in variety, Roses, Ivies, Romneya Coulteri, and several of the coloured Vines, Buddleia Colvillei, B. variabilis Veitchiana (one of the latest introductions), Desmodium penduliflorum (a flower of claret colour), Berberis in variety, a great number of Weigelas, Skimmia fragans, and S. japonica Rogersii. Returning to the neighbourhood of the mansion, Mr. Allen remarked that Gaultheria Shallon grows wild at Normanhurst.

"We have other varieties," he continued, "but this does the best. It grows seven feet high, and beyond. Just at this point there is a plant of Azalea amœna, which has been here thirty years, and forming a continuous belt right round are about sixty plants which were put in a couple of years ago."

"I observe that you are cutting out some of the Rhododendrons."

"Yes, but only the inferior ones, so as to give more room. These are all hybrids—Broughtoniana is exceptionally fine."

"The Hydrangeas also seem very fine."

"On the west side of the mansion the flowers are always of the most lovely blue; the variety is Hortensia, and we have plants which were put in as far back as 1866 still doing well. The grove, which includes the Hydrangea bed and a large bed of Azaleas behind the tennis court, is one of our features, and beyond the Azalea bed is a grass path leading to the croquet lawn. Here, Camellias grow in the open without any protection. Andromeda japonica and A. floribunda flower luxuriantly in this part of the grounds. The late Dutch and the scarlet trumpet Honeysuckle likewise thrive, and a great feature is a striking specimen of Garrya elliptica which has been here about twenty years."

"Does it require much attention?"

"No, we do not have things outside that want much attention. For instance, we have large quantities of Kalmia latifolia, Ribes, and Berberis in variety, and other hardy shrubs. On the carriage drive of the Ashburnham entrance we have a mixture of St. John's Wort and the common Heath as a groundwork below, and Cytisus in variety, for a border. This is a change from grass edging, looks well, and does not require much attention. Facing this border are Rhododendrons, including Pink Pearl, which are doing exceedingly well, a number of Lilacs, and some excellent specimens of Arbutus, seventeen to eighteen feet high."

"How are your beds in the little Italian garden in front of the conservatory filled?"

"In the centre, with Forget-me-nots and Tulips in variety, the side beds with Pansies and Wallflowers. In the conservatory there are chiefly Palms, including the Sago Palm and Chamædorea Arenbergiana, a plant about thirty-eight years old. This is a capital variety for house decoration, because it will stand in the corner of a room and not take up much space. The window is filled up with Captain Bellamy and W. H. Lincoln Chrysanthemums (two very good yellows), and Begonia Gloire de Lorraine."

Leaving the conservatory, which is lighted by electric light, and contains some handsome statuary, we proceeded past the back entrance, which is covered by shrubs and evergreen Oaks, to the magnificent winter tennis court. This contains a stage at one end and a balcony at the other. It was built eighteen years ago.

The Glass Houses.

The range of plant and fruit houses, which is entered from the gardener's cottage, is two hundred feet long, and faces south. The plant house, which we first inspected, was, as Mr. Allen explained, formerly a stove, but is now used as a cold greenhouse for Azaleas, etc.

"Your early Vinery is at present newly planted?"

"Yes, and here we grow two crops of Tomatoes each year in 10-in. pots. For early work I find the Hastings far better than any other variety I have grown; it sets freely, and averages about six fruits to the pound. For winter I find Chemin Rouge very good. In the next Vinery there is nothing but Muscats of Alexandra, which were all planted in 1867. They still give good results, and some of the old rods remain, although we are now bringing up new rods, and hope soon to replace them. I find bunches about one and a half to two pounds far better for general use than larger ones. On the back wall, which is eighteen feet high, are grown Asparagus plumosa and Lygodium scandens Fern for cutting."

"What varieties do you grow in your span Peach house?"

"Hale's Early, Noblesse, and Royal George Peaches, and Pitmaston Orange Nectarine. Hale's Early, although very little heat is given, comes in very usefully with the last Nectarines in the early house. In the late Vinery, Mrs. Pince, though not well coloured, is a very reliable Grape, and a good flavour."

"Which do you consider the best late Grape grown?"

"Lady Downe's Seedling. We have four Vines of it, and three of Alicante, another very useful Grape. An entire house is devoted to early Nectarines, Lord Napier and Victoria filling the large trellis; the flavour of the latter is delicious, and it makes a good successor to Lord Napier. In the last house (a Vinery) Black Hamburghs are grown, and produce very good fruit."

Finishing with the range, we passed into a small and charming garden in front. It is divided in four squares. The walks are covered with an arch trellis, eight feet high by eight feet wide; there is a dome in the centre, and a large arch at each end for Roses and other creepers, the trellis being used for Pear trees horizontally trained.

The Outside Fruit.

"Which," I asked, "are your favourite Pears?"

"The sorts I find the most suitable are Beurré Superfin, Beurré Hardy, Comte de Lamy, Emile d'Heyst, Fondante d'Automme, Pitmaston Duchesse, and Doyenné du Comice. On the east wall are dessert Plums, of which Coe's Golden Drop does the best. Others include Oullin's Greengage, Bryanston, and Late Transparent. On the west wall Apricots and Peaches are grown. The Alexandra Peach ripens about the third week in July. Hale's Early, Dymond, and Violette Hative all do well, and for the latest I find Walburton Admirable the best flavoured. Morella Cherries are grown on the north wall."

"And what on the walls beyond?"

"On the east, Plums—Victoria, Belgian Purple, etc.—and on one portion dessert Cherries, of which Governor Wood, Bigarreau Napoleon, Frogmore Early, and May Duke are the best. The south wall is planted with Peaches and Nectarines, of which Humboldt, Spencer, and Dryden Nectarines are very good varieties. On the west wall are only Pears; the chief of these are Le Lectier, Glou Morceau, Josephine de Malines, Marie Louise, and Doyenné du Comice, but, of course, we have several other varieties. The soil is very light and sandy, and old fruit trees require to have their roots brought to the surface occasionally to be successful with them."

"Then you have also a fruit plantation outside the east wall?"

"One portion contains bush fruit grouped together for protection from birds, and here are also the maincrop Apples. We depend chiefly upon Cox's Orange, King Pippin, and Cockle Pippin; but we have several other varieties, James Grieve being one of the best. Warner's King, Peasgood's Nonsuch, Golden Noble, and Annie Elizabeth are the best kitchen Apples."

"How large is your vegetable garden?"

"An acre and a half. The ground is very light, but with liberal manuring we grow very good vegetables. Fourteen hundred heads of Celery are grown, and here, for a change, we have our Raspberries, a fruit, in season, in great demand. We grow a few Superlative, but chiefly an unnamed variety which I found in a cottage garden, where it had been grown for upwards of forty years. It has a very large berry, the flavour is delicious, and we get a good second crop from new growths from the canes backs with much larger berries than the first crops."

"There remain the flower pits."

"In these pits there are four rows (each with a partition) twenty feet long, a bed five feet wide, and a shelf at the back for Strawberries. One pit is full of Mignonette for winter use."

"And it looks splendid. What is your treatment?"

In the Grounds of Normanhurst.

The central objects of the picture are, on the left a Birch, and on the right a good specimen of Cedar atlantica.

"We sow about the middle of August in porous but rich soil, in 5-in. and 6-in. pots. We thin out, when large enough, to about six or eight plants, and we find that this is a very useful mode of obtaining a good supply of cut blooms. Among other things, Freesias and Arum Lilies are grown here, and about seven years ago I planted one of the pits with Figs. They have done well, but the pit is rather too low for convenience, and I shall have to find a new home for them."

"How large is your Chrysanthemum house, close by?"

"It is a three-quarter span, forty-seven feet long by fifteen feet wide; the back wall is covered with a William Allen Richardson Rose,

PRUNUS SINENSIS.
An early-flowering greenhouse shrub.

in respect to which the late Rev. P. d'Ombrain wrote an article several years ago. It is a remarkably good specimen, both in number of buds and colour, which is deep apricot. The Chrysanthemums chiefly grown are J. R. Upton, Mrs. N. Molyneux, Lieut.-Col. Ducroiset, Mrs. F. W. Vallis, Mrs. Mease, Dr. Chisholm Ross, and Lord Boston."

"Do you go in much for Orchids?"

"We do not pretend to call ourselves Orchid growers, but we have a number of varieties for winter-use, such as Calanthes, Dendrobiums, Cypripediums, and a few others. The range of Melon and Cucumber pits is in four partitions. Hero of Lockinge is still one of the best Melons, and I have a good cross between Royal Sovereign and British Queen. Finally, there is the Carnation house, a lean-to, about thirty-five feet long, containing about four hundred plants. Princess of Wales and the Old Blush Malmaison are most liked. Trumpeter is a good scarlet, and Nell Gwynne an excellent white."

"There is one other question I should like to ask you. How long have the two fine specimens of Aspidistras in your drawing-room been growing?"

"They have been in the same room over twelve years, except for being placed outdoors occasionally in a shower."

"I know you have been here thirty years, so that your career elsewhere cannot have been very long."

"I started very early in life at Tregothnan, in Cornwall, under my father, who was gardener there for over fifty years. I then went to Porthgwidden, near Truro; afterwards to Syon House, Brentford, under Mr. Fairbairn; and, subsequently, before coming here as head gardener, to Mereworth Castle, Kent, making in all some fifty years of service."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 184.—WHITE FLOWERS IN FEBRUARY.

DEAR KATE,—The florists who make wreaths and bouquets say they never have too many white flowers, and, certainly, there is always a demand for them, not only for sale, but in the conservatory and the room, for they are more delicately beautiful than any coloured blossoms.

We try to have plenty of them all the year round to mix with other colours in the central group of the conservatory (opposite the drawing-room windows), which is now composed of Arum Lilies, Azaleas, Poinsettias, large double Geraniums and Ferns, surmounted by a graceful plant of Eupatorium odoratum, with feathery masses of bloom in pure white, as well as with Deutzias, which are also light and elegant.

How to Grow Eupatoriums.

Eupatoriums are not at all difficult to manage, although they are not quite hardy; after the blooms are over, we prune the plant to within two eyes of the older wood, and remove it to the Vinery, where it is syringed, but not much watered at the root, daily, until the new shoots (which quickly appear) are about an inch long. Then we take out most of the old soil from the roots and repot them in a rich compost of loam and well-dried manure, with a little soot and sand; they will sometimes fit into smaller pots than before, but should have good drainage. About the middle of May you can take them out of their pots and plant them in good soil in the kitchen garden, where they will grow strongly through the summer. You should pinch out the tips of their shoots two or three times during those months, at intervals, so as to make them very bushy; and you will find that every shoot will produce a spray of blossom towards the winter. In the middle of September cut round their roots carefully with a small sharp spade about four or five inches from the stem (so as to reduce them to the size of the pot into which they are to go), and a week later you can raise the ball of roots, and place it, with a little rich soil, in a pot. Smaller plants will, of course, only need smaller pots; and after a few days in the shade of a north wall (for the plants must not be allowed to droop) you can take them in for the winter. They are very thirsty plants, and should have soot-water twice a week, as well as plenty of tepid water daily, when in full bloom.

The Chinese Plum.

Another very pretty white flower in the conservatory is the double Chinese Plum (Prunus sinensis), which blooms naturally very early, and needs very little forcing. It is quite hardy, and can be grown in the garden, but then it does not bloom till May, so that we like to have some specimens of this little shrub in the conservatory, when they blossom in February. You can grow them from cuttings or slips of the half-ripe shoots in the spring, and they make pretty little plants, flowering whilst quite small. Every spray is covered with white rosettes, just like tiny Roses, and in the autumn the leaves of this Plum turn the most beautiful colours, in shades of purple, yellow and red, before they drop. It is a plant that should be in every garden, as well as in every greenhouse, but I much prefer specimens on their own roots to those which have been grafted, for the coarse wild Plum stocks on which the scions are grafted will certainly do their best to starve the slender growths of the Chinese Plum, unless every shoot and every sucker which appears near the shrub in the garden is destroyed before it can do much damage.

The Charming Deutzia Gracilis.

Other white flowers now in bloom are the Deutzias, which are rather in the same category as the Chinese Plum, for they both like to be well hardened in the autumn sunshine out of doors, and will then produce a wealth of blossom early in the year under glass, or later in the spring if grown in the garden. Deutzia gracilis is worthy of its name, for although its shoots are rather stiff when bare of foliage, as soon as the flowers are out they bend over in the most graceful way with the weight of blossom which covers the plant. They are very easy to grow, and they do not need to be repotted every year when they are large plants, in fact we only repot them every third year, and top-dress them with rich soil at this time, for they seem to do best when their pots are full of roots. But you must give them plenty of tepid water and also liquid manure whilst their flowers are opening, for any check then—from dryness or want of nourishment—will result in shrivelled-up flowers, most melancholy to see. These plants are charming in the conservatory in spring, and you can easily have a succession of them if you bring in a few pots at a time from the garden, where they spend the winter until January (or later), their pots being sunk to the rim in an ash-border.

After flowering they should not be turned out into the bitter east wind of our springs, for their forced foliage is tender, and will turn white and die if suddenly exposed to the open air. We put them in a cold frame, with other forced shrubs, until the end of May, after which they stand in the full sunshine throughout the summer months, and are well watered.

Early Azaleas.

The earliest white Azalea (Deutsche Perle), which was in bloom at Christmas, is now over,

EUPATORIUM ODORATUM.
A pretty decorative white flower.

but the later varieties (of which Bernard André alba is one of the best) are now in blossom, and make a grand show in the conservatory. As they go out of flower we are careful to pick off each fading bloom, for if these are allowed to form seed-vessels the plant is much weakened;

are ringed; they taper gradually up from the end in which the mouth is situated to the other; and they progress as a leech does, by alternately shortening and lengthening the body. They very soon hatch out from the eggs, and begin to devour the aphides around them, afterwards throwing their empty skins. When not feeding, they lie close to a stem or leaf, and are often killed in mistake for small caterpillars. When they are fully grown, they attach themselves by the thicker end to some portion of the plant, and in the course of a few days enter upon the winged stage, thus completing the cycle. Not less valuable allies of the gardener are the lace-wing flies, sometimes called golden-eyes, or lice-lions, the last name being given to them because of the enormous number of aphides they destroy. They are usually green, or green and yellow, in colour, and they have bright yellow eyes. The eggs attached to the stem by long stalks resemble the fruit of Moss, and this resemblance, no doubt, protects them from other insects, which might feed upon them. The larvæ have also a way of concealing themselves from their enemies, for they cover themselves with the empty skins of the aphides which they have eaten.

August 31st.—Though Imantophyllums, now called Clivias, generally flower in spring, some of mine have deferred doing so until the present time—why, I do not know. They are excellent plants for an amateur to grow, giving very little trouble, for they are never attacked by insects. The long, leathery, evergreen leaves give them a decorative value at all seasons, and when they throw up their great umbels of orange flowers, which retain their beauty for a long period, they are wonderfully handsome. Though they are ordinarily classed as greenhouse plants, I have grown them without any heat, taking care to keep them dry, though not dust-dry, in winter, and to give them some slight protection, such as a newspaper thrown over them, during severe frost. The thick, fleshy roots quickly fill the pots, and, in time, unless relief is afforded, burst them. That, however, is of no great consequence; and it is better not to be in a hurry to shift, for Clivias, like many other plants, flower best when they are rather cramped for root-room.

September 1st.—The resemblance which exists between some plant diseases and others which attack human beings is an additional reason for making a close study of them. Some time ago, a leaflet issued by the Board of Agriculture, after describing a contagious disease called epizootic lymphangitis, affecting horses, went on to say, "an organism is the cause of the malady, and it is easily transferred from the wound of a diseased horse to a wound of another horse not affected. The most common means of such transfer is by the agency of sponges, rubbers, brushes, etc." Dr. Cooke, commenting on this statement, says:—"This is precisely analogous to what takes place with the wound parasites of trees of fungoid origin, and it is interesting to observe and watch such cases, since the treatment which succeeds in one may be equally successful in the other. It may be added as suggestive that in the case of diphtheria in the human subject treatment with sulphur has proved eminently successful; in like manner is the remedy applied to the Vine oidium and the Rose mildew, both of which in habit bear a resemblance to diphtheria." In this connection, I remember that some years ago a French scientist asserted that the black spots on the skins of Apples and Oranges were identical with the sporules in the saliva of persons suffering from whooping-cough, and that by using them he had artificially produced that disease.

H. C. DAVIDSON.

A SHOEMAKER at Croydon, the owner of an allotment garden, has turned his attention to the cultivation of Shallots, with remarkable success. His crop this year works out at over £300 worth per acre, and he attributes this result to using the ashes of burnt boots freely as a fertiliser.

Famous Gardeners at Home.

No. 205.—MR. J. ALLSOP, AT THE GARDENS, ORLEANS HOUSE, TWICKENHAM.

EXCEPTIONAL interest attaches to the gardens of Orleans House, Twickenham, the historic residence on the banks of the Thames, which for many years was occupied by the late Comte de Paris. The present possessor is Mr. W. Cunard, under whose auspices the place has maintained all its old charms, while, at the same time, a number of new features have been added. One of the most attractive of the latter is the verandah, covered with Geraniums Madame Crousse, which, on the occasion of my visit, on the 8th of July, at once engaged my attention.

"It looks its best in August," said Mr. Allsop, the head gardener, as I admired the mass of pink flower, "but it lasts until the frost comes."

The lofty conservatory is divided into two sections, with a central hall between, the roof being covered with Cobæa scandens variegata. Here, also, were Hydrangeas, Lilies, Ferns, Coleus, Humea elegans, and Campanula pyramidalis.

"How long do you keep the Hydrangeas?" I asked.

"We run them for two years, and the second year's flowers are better than the first. They are cut down and branched the second year, and then thrown away. Liliums succeed the Hydrangeas."

"What are the principal plants in the border in front of the mansion?"

"Heliotropes, Lantanas, and Fuchsias, with a groundwork of Begonias, and a quantity of Plumbago worked in at the back. The beds on each side contain mixed varieties of Begonias, with a background of single Dahlias, Cannas, and Abutilons. The ornamental vases, as you see, are filled with Dracænas."

"You have a bed on the lawn containing Nicotiana Sanderæ?"

"Yes; the latter are just in flower. The Nicotiana affinis we flower right up to the time the frost sets in. Along with the scarlet variety, it forms a striking contrast. Another bed is made up of scarlet Cannas, and a groundwork of Ageratums, while near it is a bed of yellow Cannas, with the same groundwork."

"The bed of Delphiniums and Larkspurs is effective."

"The Delphiniums, which are annuals, were grown from seed this year."

"Roses are grown in quantity in the beds on the lawn?"

"Yes; we make Roses a feature. The large bed has a groundwork of Sutton's hybrid Lobelias, with Mignonette. The Roses include La France, Baroness Rothschild, Mrs. John Laing, General Jacqueminot, Hippolyte Jamain, and are grown as standards and half-standards, with bushes round the outside. One of the beds near by consists of Sutton's Fairy Queen Begonias, edged with blue Ageratum, another of Verbena Miss Willmott, edged with Dandy Geraniums, while a third has President Garfield Heliotropes, edged with Pyrethrums."

At this point we stayed to look at a singularly pretty border, serpentine in shape, with Abutilons, Humeas, Fuchsias, Lantanas, standard Heliotropes, Salvias (Sutton's Scarlet King), intertwined with Cannas.

The standard Heliotropes," said Mr. Allsop, "were all raised from cuttings in the autumn. We never keep the old plants. Our system saves trouble in storing, and the new plants flower quite as freely."

"You have Gladiolus to follow the white Stocks in the bed, in front of more Roses."

"Yes; they are mixed hybrids, and look bright and pretty. The Stocks, which are edged with blue Lobelias, are not the Ten-week varieties, but they last a couple of months in flower. In all these beds the blending of colour is aimed at. Mr. Cunard is very particular that great care should be exercised in this respect."

"There are several beds of Begonias?"

"We use them so largely because there is nothing to beat them for bedding. Take, for instance, that bed of large-flowering white Begonias, edged with blue Ageratums, or the bed of scarlet Begonias close to it."

"They certainly look exceedingly well."

"And they last so well—much better than Geraniums. We have no Geraniums in the beds. Wet seasons suit Begonias, because they like

ORLEANS HOUSE, TWICKENHAM.

This charming house was formerly the residence of the Comte de Paris, and its grounds were, and are still, regarded as one of the beauty spots of Suburban London.

moisture, but they will stand almost any kind of weather. We have gone in for them strongly for several years. One of the best varieties of the scarlets is Lafayette, of which there is a bed, with a groundwork of Alyssums. The Begonias flower early, and last well into September."

"When are your Calceolarias amplexicaula at their best?"

"They are in flower about the end of July. We go in largely for them. They are raised from cuttings in the autumn, and we can get them six feet high by April. Underneath the Calceolarias are blue Heliotropes, and the bed is edged with Pyrethrums—Sutton's double. Another large bed contains Cannas and Abutilons, which do well together. They are at their best in August, and go on flowering until the autumn. Zinnias, edged with Dandy Geraniums, fill a large bed. They are Sutton's large-flowering strain, and form a combination of white, yellow, pink, scarlet, and violet, about two feet high, making a fine show."

"Are Zinnias difficult to raise from seed?"

"Yes; they are rather difficult. It is better to sow late than early. There is a bed of Ivy-leaved Geraniums, chiefly Souvenir de Charles Turner, with a groundwork of the same varieties. Other beds contain golden Calceolarias, edged with blue Ageratums and pink Begonias, five or six inches across."

"And the two large borders of herbaceous plants?"

"One consists mainly of Phlox, Dahlias, Abutilons, and Lychnis, with Coreopsis at the edge, and Sutton's Miniature Marigold right round. In the other, Sweet Peas are intermixed, and it also includes a large number of Delphiniums, which have flowered well."

Noting two nicely clipped Yews on the lawn, we went to the Wilderness, a delightful retreat, where Nature is allowed to follow her own bent. Here, too, there are some noble specimens of Cedars of Lebanon, Planes, and Elms. From the Wilderness we entered the kitchen garden, which, however, contains many flowering plants. On each side of the centre is a herbaceous border filled up in much the same manner as the borders in the pleasure garden.

"Do you consider the Apple crop good?" I asked, as we came to a number grown on bushes.

"Very fair; but the Plum and Pear crops are poor. Most of the Apples are grown on the bush, and include Hawthornden, Cox's Orange Pippin, King's Pippin, Ribston Pippin, Wellington, and Codlin, which fruit exceedingly well, and, on this soil, grow to a large size."

"Which Pears do you prefer?"

"Clapp's Favourite, Conference, Louise Bonne of Jersey, and the Trout Pear (an old variety, and very nice), are among the best."

"Do you force many Strawberries?"

"About five thousand Royal Sovereign. We also grow Latest of All, Laxton's Monarch, James Veitch, and Sir Joseph Paxton, which latter is an old variety, but still very good."

There are a few frames in the kitchen garden, and at the back of these is another herbaceous border, including a quantity of old varieties of Michaelmas Daisy, and of Phlox.

"We make a speciality of the latter," said Mr. Allsop, "and have all the best varieties for cutting purposes. Also, in spring, we have a quantity of Spanish Iris."

"Your Peach houses must be large."

"Those are devoted to Nectarines exclusively. One of them is a hundred and thirty feet long, and the other a hundred feet long. We only grow Early Rivers, the trees having been planted about seven years ago. We picked in one house, between June 3rd and June 26th, when we finished, nearly four thousand fruits, the greatest number in one day being five hundred and seventy-four. Early Rivers is a wonderful Nectarine."

"You have Roses at the back of the Nectarine house?"

"Yes; Tea and Hybrids, grown for cutting. The old Foxglove flourishes. The seeds drop, and we let them remain on the ground."

"How many Chrysanthemums do you go in for?"

"Close upon a thousand, of which about four hundred are Japanese. The varieties include F. S. Vallis—about thirty plants—Mrs. Barkley, Probyn, Mafeking Hero, Graphic, General Buller, Chatsworth, Charles Davis, Jane Molyneux, Mrs. H. Weeks, Upton, Madame Paolo Radaelli, Mrs. J. C. Neville, and Mrs. Greenfield (one of the best yellows)."

"You have a number of fine specimens in your Palm house?"

"They were all in small 'thirty-twos' when I came here, twelve years ago, and they have grown so rapidly that I have had to drop them down to keep them in the house. Some of them are now sixteen feet, in 'eights.' The varieties include Kentias Fosteriana and Belmoreana. In the Pelargonium house the Geraniums include King of Denmark, King Edward VII., Raspail, and others."

"Are the double Petunias named?"

"No; they are seedlings. I choose the best each year, and throw the others away. There are about one hundred in pots. They start flowering from cuttings at the end of June, and, with careful treatment, keep on until the end of September."

"Which do you consider the best of your grand show of Malmaisons?"

"Grand Duchess Olga, Blush, Lady Rose, Professor Bell (a fine variety), and France (a great favourite). There are about a hundred plants. We have a hundred and fifty plants of Crassilis, a pretty pink flower, which ought to be grown more than it is."

"Is it easy to grow?"

"Quite. It wants cool treatment most of the time. The plants keep in flower for a couple of months, and the foliage is as pretty as the flower."

"Which class of Fern do you recommend?"

"I have a great liking for Aspleniums. They are easy to grow—you increase the stock by taking the young plants that form on the old fronds. The Asplenium is a very good Fern to grow for decorative work, where a lot of furnishing has to be done; it is very hardy, and wants no coddling. In the Fern house we have about three hundred Gloxinias, Sutton's strain."

"How many Caladiums?"

"About three hundred. These plants will be about three feet through in August. We expose Caladiums to the sunlight, in order to get the colour. They do not burn, though, of course, that is a danger if the plants are too near the glass."

"What Grapes do you grow in the Vineries?"

"In the Vineries here, Madresfield Court and Muscats. The Vines are twenty years old. The adjoining Nectarine house contains Lord Napier and Pineapple, and we have had heavy crops and good fruit. These trees are twelve years old. The large Peach tree is nearly twenty years old, and the variety is Alexander Noblesse. It carried about three hundred fruits this year. But you have yet to see our large fruit houses."

"Before we leave the kitchen garden, is there anything you care to say about any other flowers?"

"We keep Sweet Peas in separate colours, growing Sutton's Giant in ten varieties; we also have a large bed of Chrysanthemum maximum, a bed of the Old Clove Pinks, with a quantity of Raby Castle, a number of varieties of the single and double Helianthus, and a good collection of Dahlias. We strike the Dahlia cuttings early in spring, obtaining, in consequence, more quality in the flower."

"You have not mentioned vegetables."

The Chrysanthemums at Orleans House.

About a thousand plants are grown each year, of which four hundred are Japanese varieties. At the flowering period the Palm-houses are given up to the plants.

"There is nothing very special. All the usual vegetables are grown. The two leading Peas are Sutton's Early Giant and Sutton's Favourite Marrowfat. We do not have more than three or four varieties, which suit the soil."

"What is the extent of the ground?" I asked, as we walked towards Lebanon House, formerly occupied by Mr. Cunard, who still retains the kitchen garden and the houses which he erected.

"Between twenty and thirty acres."

When we arrived at the magnificent range of houses put up by Mr. Cunard during his residence at Lebanon House, and covering three acres, Mr. Allsop informed me that, up to the time of my visit, twenty-three thousand Peaches and Nectarines had gone to market.

In one house were Cardinal Nectarines, out of which two thousand fruits had already been taken.

"We shall go on picking from later houses," continued Mr. Allsop, "until the end of September."

"How many Cucumbers do you get in the house?" I asked, as we entered another.

"We have cut seventy dozen. The variety Sutton's Improved Telegraph, one of the best, good flavour and a heavy cropper. The Strawberries are forced in the pits, and Melons fol

the Strawberries. The varieties are Windsor Castle, Triumph, Sutton's Superlative, Hero of Lockinge, and Sutton's Scarlet. We get from four to five hundred Melons a year in three pits."

"How many Peaches and Nectarines do you average per day?"

"Some days in the season we average two thousand. In the house of Lord Napier Nectarines, which is a hundred and twenty-six feet long, and twenty-six feet wide, we get a crop of about five thousand. Lord Napier is grown on one side of another house, and Early Rivers on the other, with standard trees of Thomas Rivers Peach all along, and Tomatoes in between—Sutton's Best of All and Winter Beauty."

"This is where you grow your Pineapple Nectarine?"

"Yes," rejoined Mr. Allsop, as we entered another house; "in this house there is one Pineapple Nectarine tree twelve yards wide, with a 16-ft. stem, which carries nearly a thousand fruits. For flavour there is not another Nectarine to equal it. Here there is a big tree of Royal Ascot—a very old variety."

"And Peaches?"

"In this house there are mixed varieties, Violet Hative, Gros Mignon—we have had two hundred Peaches off this tree already—and Rivers' Orange Nectarine, with small but splendid fruit. The early Peach house contains Dymond and Lord Napier Nectarine."

"You train Vines along the roof?"

"Yes; Black Hamburgh. The cutting was put in nine years ago, and last year it carried a hundred bunches. I think that it has as many this year. Another, planted at the same time, carries seventy bunches. In another Peach house, Madresfield Court is trained along the roof on the same principle, and carries a good, heavy crop. It was put in five years ago. The other houses include a late house of Lord Napier Nectarines, which do not come in until August, and a house, eighty yards long, containing Peaches and Nectarines on one side only—Barrington, Sea Eagle, Nectarine Peach, and Lord Napier, carrying about four thousand fruits."

"How long have you been a fruit grower?"

"I commenced gardening a quarter of a century ago. My previous appointments were at Hartham Park—Sir John Dickson-Poynder's place in Wiltshire—and at Kenwick Hall, Louth."

ALFRED WILCOX.

AUTUMN ROSES AT A WINDOW.

The second blooms of the William Allen Richardson Rose are now at their best. The second blossoms may not be as finely proportioned as the first, but the colouring is invariably better.

Letters from a Lady Gardener.

No. 161.—HARDY HOUSE CLIMBERS.

DEAR KATE,—Last week I discoursed to you on the subject of half-hardy climbers, now I am going to write about hardy climbers, for I sometimes see such ugly houses which might be made quite picturesque by planting a few of these next month, that I think it is a pity that we don't all do as much as we might to beautify our own homes. When I have travelled on the Continent, I have been surprised to see the bareness and ugliness of most of the houses; in looking out of the train, one naturally expects to see cosy homes nestling amongst the trees, with bright flowers about them, and half smothered with creepers, such as we come to continually in English travelling, with the thought, "What a nice place to live in!"

But abroad I was reminded strongly of the boxes of toy houses, trees, etc., which I used to think so charming to play with on the carpet, when I was about four year old; the houses might be taken up and put down anywhere else, just as well as where they were, for they had no trees and no climbers, so that they did not look a bit homelike, and were most depressing and uninteresting. Why do Continental people never plant climbers? It is not a riddle, and, if it were, I don't know the answer, and I don't believe there is one. But we, who have a reputation for the love of home, must live up to it, and everyone should make his home look as charming as possible, outside as well as in.

Now, about Roses—how many climb over your house, and look in at your window? My window (upstairs) has been a mass of lovely apricot flowers of William Allen Richardson, which climbs to the top of my house, and wreathes the walls all the way up with hundreds of blooms. I send you a photograph of this Rose, taken August 30th, and it is still a picture, although it blossomed profusely in June. I am very fond of wearing these Roses as a buttonhole; and it really is very convenient to be able to gather them at one's window whenever a fresh bouquet is required. I advise you to plant your favourite Rose under your window, with a view to buttonholes in the future. Another Rose which grows here is the creamy-yellow Banksia Rose; but I believe this is not so hardy as the rest, and, maybe, would not throw up its long new shoots yearly in a cold district. This Rose suffers sadly in some gardens from the terrible shears of the gardener, who generally cuts off its long growths, and snips it into perfect tidiness, never thinking that he has cut off, with these shoots, all chance of bloom for next season. Climbing Captain Christy is a lovely Rose, with exquisite flowers in pale pink, extra strong in growth; climbing Caroline Testout is equally robust, with beautiful salmon-pink blooms. Niphetos is in purest white; and Bardou Job has semi-double blossoms in crimson-velvet, and golden stamens, a most decorative Rose for cutting, and perfect as a buttonhole; and there are plenty of others, if you want them, in any good Rose catalogue.

On the other side of my window the Japanese Honeysuckle (Lonicera brachypoda) grows, also reaching the top of the house. This is a most desirable climber, for it is evergreen, quite hardy, and always looks comfortable and handsome, except, perhaps, when it has to be cut back in February, as, otherwise, it gets too rampant altogether. But the masses of blossoms it produces from June until Christmas! They scent the whole house in the early morning and

CLIMBERS ON AN EAST FRONT.

It is evident from this picture that aspect alone cannot be accepted as an excuse for the absence of climbers on the side of a house. The wall on which the climbers are growing has a due east aspect, and yet they have made steady and uninterrupted growth since the first season.

if they are choked throughout the late summer by carpeting plants, and then transplanted late in the autumn, when the borders are renovated and tidied for the winter. If gardeners would realise that much trouble may be saved by shifting Irises when they have only just finished flowering, or even when actually in bloom, far fewer flowers and plants would be sacrificed." The new roots then have time to go down into the soil, and to anchor the rhizomes so firmly that they are not likely to be disturbed in winter.

THE ELEVENTH HOUR.

May 3rd.—The sooner rooted cuttings of Chrysanthemums and other plants are potted the better. If they are allowed to remain in boxes until their roots are all matted together, they are liable to be stunted, and it is impossible to lift them without breaking very many of the roots. It is not always easy to get out the first two or three without injuring the others around. The best way is to place the box on its side, and then to tap it until the whole soil is loosened, and comes forward sufficiently to enable a corner to be grasped and several of the plants there to be detached. Of course, care must be taken that it does not fall right out, but that is easily prevented.

H. C. DAVIDSON.

HYBRID HARDY PRIMULAS.

We have now a considerable variety of hybrid hardy Primulas, and the number will soon be largely increased. I hope to return to the subject shortly, especially with reference to various hybrids of Primula japonica. In this note I am confining myself to several named hybrids derived from P. pulverulenta and P. Cockburniana. The latter is, as is pretty well-known, only a biennial in some places, and in most gardens, if perennial, is short-lived. At the same time, its colour has given rise to the belief that it would prove an excellent species to use for hybridising. Some of the earlier hybrids did not prove so permanent as was hoped, but recently others have appeared which seem to be more enduring. Probably the best of these, so far as named varieties are concerned, are the following, which are better than Unique, one of the early productions.

Lissadell Hybrid is one of the most satisfactory. It has nice, soft vermilion flowers, with the habit of P. pulverulenta, but only about two feet high at the most. Another form of this, called Lissadell Hybrid No. 2, is lighter in colour, and resembles Unique, but is a better doer. Aileen Aroon has fine, bright scarlet flowers, and is an effective variety. In one named Brian Boru we have a Primula with bright red blooms; and a rather curiously coloured but attractive one, called Maeve, has a saffron eye in the centre of the raspberry-pink flowers. A very brilliant variety is called "Red Hugh," a name justified by its colour—a brilliant, flame-like red.

In Una we have a distinct thing, the colour being of a kind of russet-orange. These will do in good garden soil, but prefer a moist position.

S. ARNOTT.

A conference of fruit growers will be held on Friday, May 9th, in Room B, Central Hall, Westminster, at 2.30 o'clock in the afternoon. Tickets are obtainable from the Chamber of Horticulture, 11, Adam Street, Adelphi, W.C.2; from Mr. A. J. Monro, Market Gardeners', Nurserymen, and Farmers' Association, 41—42, King Street, W.C.2; or Mr. Duncombe Gibbs, National Fruit Growers' Federation, Fairfield, Pershore.

The name Hollyhock is derived from *holi*, holy; and *hoc*, Mallow, Holy Mallow, so called because brought from the Holy Land.

UNLIKE many another Thames Valley estate, Petersham House, for many years the home of the Warde family, has to rely on itself for its attractions; for, although close to the silvery, winding Thames, none of the wanderings of the world-famous river may be seen, nor are there views of distant hills or adjoining properties. It is situate on level ground just below Richmond Royal Park, and the mansion is hard by the King's highway. No one could fail to be impressed by the elegance of the design of the Tudor gates and railings at the entrance. Generally the house is distinctly Tudor, though the top story was added during the reign of George I. Petersham House was at one time the country retreat of the ill-fated Catherine of Arragon, and inside the porch may be seen the twin embrasures where the guards stood whenever the Queen was in residence. A very old Wistaria sinensis drapes the whole front of the house, and will soon be a delightful sight.

Petersham House is very rich in valuable gates, for besides the two pairs at the entrance there are a couple more in the garden proper. The dignity and charm of these hammered Tudor gates is quite irresistible, and another desirable feature is the old, very old, brick wall which surrounds most of the garden.

"It is reputed to be over three hundred years old," said Mr. Allum; "and, judging from its appearance, one would agree with the estimate. The face is all punctured with nail-holes where fruit trees have been secured for centuries." One wonders how many bygone generations of gardeners have driven wall-nails into the wall, and what varieties of fruits were first grown against it.

The present-day trees are, of course, of the best varieties, and produce splendid fruits in anything like a favourable season. A rather unusual feature on one wall is a trained Mulberry. Although it does not produce much fruit when grown in this fashion, its leafage is most ample, and very refreshing to the eye on a hot summer's day.

THE PARISH CHURCH.

Although not in the garden, the old parish church is so close as to form an integral part of one of the best garden views. The church is said to date from the time of William the Conqueror, and the Saxon windows, which are in a state of splendid preservation, draw numbers of admirers. In this church Prince Rupert was married, and under it lies the dust of many notabilities.

The leading feature of the pleasure grounds here are smooth green lawns, specimen trees, and flower borders. In the last-named, Chinese herbaceous Pæonies are especial favourites, and they contain strong clumps of all the best varieties. Tree Pæonies have also been planted during recent years, and, judging from their growth, one would say that in this sheltered, sun-trap of a garden, spring frosts are rarely destructive to them. Iris gigantea thrives especially well under Mr. Allum's treatment, and on adjoining borders may be seen generous breadths of the common Lily of the Valley and of Fortune's Giant variety, which generally blooms about ten days later. Sheltered by overhanging trees, and consequently cool, may be just seen the entrance to the ice-house, which in olden times was an indispensable adjunct to the country house. Now it has been converted into a supplementary Potato store, and Mr. Allum informed me that it contained, at the moment, fully two tons of ware tubers.

A ROSE BORDER AT PETERSHAM HOUSE.

KITCHEN GARDEN BEAUTIFUL.

Petersham House well illustrates how attractive a vegetable garden may be made when pergolas over broad grass walks and flower

Digitized by Google

borders are associated with it. At all times it must be of interest, and now that the fruit trees are bursting into bloom, and the soil shows the tender green of many sprouting vegetables, it is a particularly attractive spot.

"Yes, I am a great believer in intensive cultivation, and particularly in successional cropping, so as to get the utmost out of a garden. But for this deep digging and liberal manuring are essential. As you see, I have many frames occupied with seedling vegetables, which, as soon as the weather permits, will be planted out in their permanent quarters. Hitherto I have, like so many other gardeners, been greatly handicapped by labour shortage, but I am expecting the first man back next week, and I hope he will soon be followed by others, though one, alas!" added Mr. Allum, "will not return."

Of the many crops, space does not permit mention, but I cannot resist remarking on the vigour of such early Peas as William Hurst and the regularity of the Onion seedlings.

"This," said Mr. Allum, "is where the Orangery, that indispensable feature of our ancestors' garden, stood. It was, of course, heated by flues, but the whole structure became so much the worse for wear that it was pulled down, and a small modern conservatory erected near by." Here is to be seen splendid Hippeastrums, Richardia Mrs. Roosevelt, a lemon-yellow variety, and many other decorative plants.

As we approached the glass department I inquired as to Mr. Allum's plans for future exhibiting, for he has been a most consistently successful competitor in the past at the Richmond, Kingston, and Twickenham Flower Shows, particularly in the open classes for border flowers and stove and greenhouse plants. The quantities of prize cards, mostly firsts, hung up in the potting shed, testify to Mr. Allum's successes. But—at present at any rate—he does not intend to return to the arena.

"There's so much reconstructive work to be done in the garden, and labour will be short, so I have decided not to compete again. But I shall not lose interest in the plants. Here are a number of Caladium tubers just starting into growth, which I have managed to preserve. The Coleus are pretty good, and so, I think, are the stove plants generally," and with this I am in full agreement. Tomatoes, under glass and in the open, are largely grown—Carter's Sunrise, Ham Green, and Holmes' Supreme are the varieties, and the plants are splendid.

As we made for the Bute Garden, Mr. Allum remarked that the place seemed to be honeycombed with tunnels, and occasionally a fresh one is discovered owing to the subsidence of a path.

THE BUTE GARDEN.

This portion of Mr. Allum's charge, which is on the opposite side of the Petersham Road, and was bought by the late Mrs. Warde, would alone be satisfying to most garden lovers, for it is very spacious, and includes charming walks. The mansion, which was used by successive generations of the Bute family, abutted the road, and when it was pulled down the removal of the "footings" left a very large pit, which would have required many hundreds of loads of soil to fill. But Mr. Allum has an ingenious turn of mind, and instead of filling this great depression converted it into a sunken rock garden, making a most delightful feature, and one which, besides giving great satisfaction to the owner, gives immense pleasure to hundreds of top-deck passengers on the Surbiton-Ealing 'bus which daily passes by. A large mound was made in the middle of the pit, the sides were sloped, and a quantity of boulders suitably introduced, and there quickly was prepared the framework of the sunk garden.

"Mr. Warde rightly insists on bold masses of flowers," said Mr. Allum, in response to my remark on the splendid effect before us; "so I planted suitable Alpines in dozens, fifties, and hundreds, and this, of course, is one reason why this garden appeals so much to the 'bus passengers." At the moment Aubrietias and early Saxifrages, Primroses and Polyanthuses, are glorious. The display will be continued by other genera and species for many months. A long border of the Madonna Lily (Lilium candidum) is throwing up strong, fat spikes—I have in former years seen them five feet six inches high, and they promise to equal this during the coming season. In the half-shade of the far side, where a Horse Chestnut and Ilex Oaks form a fitting background, Lilies of the Valley and Solomon's Seal are perfectly happy, and will soon be in bloom.

"Did you ever see the native Harebell seed itself so freely in a garden before?" asked Mr. Allum, indicating hundreds of seedlings at the edge of the shrubbery and in the path as we left the sunk garden to see some of the fine forest trees for which the grounds are noted, and I freely admitted that I had not, nor anywhere else.

Ilex Oaks and English Yews abound, and become almost commonplace. On the left stands a fine old Cedar of Lebanon, decidedly a contemporary of the trees on the adjoining slopes of Richmond Park, which have often inspired painters and poets alike. The "dark green layers of shade," as the poet so aptly described the branches of the Cedar, are in this instance lightened in a really wonderful manner by hundreds of last season's cones, which are now of a light chestnut colour.

The Bird Cherry is quite a common tree in the south-western suburbs, particularly in Hounslow, Lambton, and Heston, where this graceful flowering tree quickly becomes an elegant pyramid; but these are as children compared with the Petersham specimen. Its trunk is as large and as rugged as that of many an Ilex Oak, and its limbs spread widely. In a few weeks' time, when its innumerable, pendant little racemes of white flowers are open, it will be a memorable sight. Noteworthy as this tree is, it pales utterly before the dimensions of an enormous Black Walnut hard by. Its trunk runs up fully thirty feet without a break, and at five feet from the ground girths over eighteen feet.

At the far extremity stands a striking church, which Mr. Warde's mother presented to the parish. It is said to have cost her £84,000. The interior marble and tapestries are very beautiful. Retracing our steps from the church, we diverged to admire a magnificent Beech tree, a perfect specimen which "stands in its pride alone," and is in the first flush of its tender green leafage. Near to the Richmond Park boundary wall is the finest example of the "Turkey Nut" in this country, a splendid tree which bears huge nuts, but, alas for the ubiquitous small boy who gambols in the park, and eagerly seizes the fallen fruits, they have no kernels.

Reluctantly I leave this pleasant place—its splendid Oak trees, smooth green lawns, and beautiful flowers—where King James and his nobles sauntered, nominally free from the cares and troubles of State. But who knows what plots and counterplots were hatched there in those troublous and uncertain times?

But such belong to the historian, and not the horticultural scribe, so, "the day being far spent," we entered Mr. Allum's pretty and cosy house for a brief rest.

"Now, Mr. Allum," I said, when our pipes were alight, "I must be inquisitive. Where did you first learn the A.B.C. of our fascinating craft, and so forth?"

HERBACEOUS BORDERS AT PETERSHAM HOUSE.

"I was apprenticed at Thistleworth, in Twickenham, where the gardener grew all fruits, including Pineapples, particularly well. After three years I went to the Duke of Buccleuch's garden at Cambridge House, not far away, and worked successively in the then famous pleasure grounds and in the glass department. I then became foreman at Letchmere, Ham, still in this country. Letchmere was over fifty acres in extent, and general gardening was well done. From this place I was appointed gardener at Manor House, Petersham, leaving there almost twenty years ago to take charge here for the late Mrs. Warde, and on her death, twelve years ago, Mr. Lionel Warde confirmed the appointment, and here I am still."

It is the busy man who finds time for doing things, and besides first-rate gardening—no easy matter during the past four years—Mr. Allum finds time for the duties of Assistant Overseer of Petersham; to be an R.H.S. representative on advising allotment-holders; Horticultural Representative to the Richmond Food Committee, and secretary of the Petersham Institute, which building owes itself to the munificence of the late Mrs. Warde.

A. C. BARTLETT.

instance was even the receipt acknowledged, while the number of copies of the *Bulletin* of the corresponding Paris Congress which found their way to the libraries of this country may, we believe, be summed up by a cipher.

ISAAC ANDERSON-HENRY.

Mr. Anderson-Henry, better known as Isaac Anderson (for the addition "Henry" is a comparatively recent annex, rendered necessary by the material requirements of a deed of entail), is a Scotsman, born at Caputh, in Perthshire, about the commencement of the century, and descended from the Andersons of Auchranie, a family who ought to have something horticultural in their disposition, for their lands have been held of the Crown on payment of a white Rose at midsummer yearly for several centuries.

He was educated for the law, and for a number of years practised in Edinburgh as a solicitor to the supreme courts. Although favourably known as a judicious and able man of business, Mr. Anderson never took very kindly to the dry details of the law, and as soon as circumstances permitted gladly renounced them. His fame as a horticulturist was made, however, while fully occupied with his professional pursuits, and his researches and observations were conducted in the morning and evening when he escaped from the office in town to his pleasant home in the environs of Edinburgh.

His tastes for natural science were first developed about 1836, by his having for his nearest neighbour another amateur, Mr. Pattison, who was an enthusiast in plants, especially bulbs. Once launched he made rapid progress, and from the accidental circumstance of his having had a gardener who was skilful in hybridising (an accomplishment then little thought of by ordinary gardeners) he was led to occupy himself a good deal with that branch of horticulture. Success produced its usual consequence—a still greater love for its subject, which, as its results gradually unfolded more and more of the mysteries of Nature, ere long grew into a passion, which ended by making Mr. Anderson one of the foremost hybridisers of his day. His little garden became celebrated. Every one who loved botanical or horticultural studies was sure to find there something new or interesting, and it naturally became a favourite resort with kindred spirits.

The culture of newly-introduced plants, and more especially of alpine species, was the other branch which he specially affected, and in this, too, he was somewhat the creature of circumstances, for it was undoubtedly his intimate correspondence with Professor Jameson, of Quito, that, by supplying fuel to his lamp, led to his extensive prosecution of that most delightful branch of horticulture. The skill and pains bestowed in the culture and rearing of plants from such regions cannot be adequately represented. No branch of culture affords more scope for the intelligence and resources of the horticulturist than that of plants from tropical countries of such exceptional altitude as 11,000 to 15,000 feet above the level of the sea.

From this source came many new plants, which have been figured and described in the *Botanical Magazine* and elsewhere, of which we may mention—

Calceolaria chelidonioides, figured in Lindley and Paxton's *Flower Garden*, vol. ii., p. 143, in 1852.
Calceolaria ericoides,
Pitcairnea pungens, *Bot. Mag.*, tab. 5356.
Micranthella Candollei, *Bot. Mag.*, tab. 5455, in 1864.
Calceolaria hyssopifolia, *Bot. Mag.*, tab. 5548, in 1865.
Pleroma sarmentosa, *Bot. Mag.*, tab. 5629, in 1867.
Draba violacea, *Bot. Mag.*, tab. 5650, in 1867.
Delostoma dentatum, *Bot. Mag.*, tab. 5754, in 1869.
Calceolaria Henrici, *Bot. Mag.*, tab. 5772, in 1869.
Tacsonia eriantha, *Bot. Mag.*, tab. 5750, in 1869.
Tacsonia quitensis, *Bot. Mag.*, tab. 5876, in 1870.
Fuchsia sessilifolia, introduced in 1866, *Bot. Mag.*, tab. 5907, in 1871.
Muntingia Calabura, *Bot. Mag.*, tab. 5982, in 1872.
Salvia rubescens, *Bot. Mag.*, t. 5947, in 1872.
Brachyotum confertum, *Bot. Mag.*, t. 6018, in 1873.
Besides many others from various quarters, not yet let out.

Mr. Anderson joined the Caledonian Horticultural Society in 1841, and soon was elected a member of its Council, an office which he continued to hold until the Society was revolutionised, and the Experimental Garden belonging to it merged in the Royal Botanic Garden.

ISAAC ANDERSON-HENRY.

Among the papers communicated to that Society by Mr. Anderson was a rather important one, on the necessity of free access of air to the roots of plants, a condition very little attended to. This necessity forced itself on his notice from his observation of some cuttings which he had put in a glass to strike in water. He had allowed the water to remain for a long time without being renewed, and a film of sufficient consistency to exclude air had gathered on its surface. The consequence was that roots were thrown out from the stems above, and not from the base of the cuttings beneath the water.

The importance of attending to this was illustrated by a reference to the effect which surrounding trees by pavement produces on the health—a consequence now well recognised, but at the time of Mr. Anderson's paper scarcely at all thought of. Other important papers of Mr. Anderson's, especially one on hybridisation, and another on pure hybridisation, will occur to the recollection of our readers. These were written in 1867 and 1868, and were contributions to the Botanical Society of Edinburgh, made by him in fulfilment of his duties as its President. These papers are perhaps the most important which Mr. Anderson has given to science. They were upon his own speciality, and contain an epitome of his observations and experiments during many previous years. They will be found in vol. ix. of the Society's *Transactions*, and so far as they go may be regarded as a standard authority on the points treated of. Reference may also be made to a paper on these subjects embodied in another classical work, viz., a contribution to M'Intosh's *Book of the Garden*, which the late Dr. Lindley did Mr. Anderson the honour to adopt and recommend in his *Theory and Practice of Horticulture*.

Mr. Anderson-Henry has also contributed various interesting communications to the Scientific Committee of the Royal Horticultural Society, of which, as well as of many other learned Societies, such as the Linnean Society, the Royal Society of Edinburgh, &c., he is an honoured member.

THAW LINES.

The season has been distinguished by the number and short duration of its tiny snow storms. The snow has fallen fast, and thawed almost as rapidly, and this has happened again and again; it has therefore offered unusual facilities for observation. It is well known that the snow disappears under trees much sooner than from the open ground. Various reasons may be assigned for this—the first and most obvious being, that as the top intercepts the snow in falling, less snow reaches the ground under trees than in the open, and consequently less time would be needed to melt it. This seems clear as an axiom; but, nevertheless, it by no means covers all the observed facts; such, for instance, that the snow does not melt equally all round the tree, nor fastest where the top is thickest, and where, consequently, on this hypothesis, the snow layer is thinnest. On the contrary, the thaw lines or patches are most capricious, now shrinking in far beneath the overhanging canopy, and again running out a long way beyond the shelter of the branches. Again, were the melting of the snow a mere mechanical affair of varying thickness, then it would invariably melt soonest under evergreen trees. But this is not by any means the case. For instance, I observed last week the snow completely gone under a huge Wych Elm, while the branches of Pinus excelsa, Sabiniana, macrocarpa, and others, rested upon it all round. On the interception theory alone this seemed quite inexplicable.

Another explanation may be hazarded. The trees are centres of warmth, each bole and branch affecting the snow as a fire would, only in a lesser degree. This theory would explain the difference between the Elm and the Pine thus:—The Elm, being the largest tree, spared the more caloric for the snow, and hence it was the sooner melted. The deciduous tree may also have had another thing in its favour. Its heat had free course to the snow, its bare boughs offering little, if any, resistance to the passage of caloric from the tree to the ground, whereas the Pine branches were so many screens to intercept the warmth, the difference being as a fire in a room without anything before it, and the same fire with a full clothes-horse. But, then, on this supposition, the snow ought to have dissolved regularly all round the bole and main branches, beginning at the trunk and melt-

Alexander Anderson

Gardeners' Chronicle, 1877, n.s. 7

Mr. Anderson, the subject of the present illustration, was born in the parish of Redgorton, in Perthshire, on July 24, 1820, soon after which his parents removed to the parish of Kinnoull, in the vicinity of Perth, and in the parish school there he received the greater part of his education. When sixteen years of age he was apprenticed for three years to the Messrs. Dickson & Turnbull, nurserymen, Perth, to learn the profession of a gardener. The nurseries at that time were under the superintendence of Mr. Anderson, the present proprietor, and those who know him will bear out the statement that a more energetic man could not have been found for drilling his pupil into active habits in the acquirement of his profession. After going through the usual initiation in digging, raking, pruning, &c., for a time, he was transferred to the glass department, where the propagating of choice and ornamental plants was extensively carried on. Here he began to learn the names of plants, the remembering of which proved to be somewhat difficult at first, but he found that by writing them over once or twice they were impressed on the memory with little trouble, and this practice he has often recommended to young men since. The collections of herbaceous, bulbous, and exotic plants were extensive, and afforded an excellent opportunity of getting familiar with their names and characters, and by drying specimens, and forming a herbarium of alpine and exotic plants, he made fair progress in gaining knowledge. During the summer season he devoted his spare time to making short excursions in search of alpines, collecting, drying, or arranging specimens, as circumstances required, and by the end of his apprenticeship had thus acquired a rather bulky collection. In winter he devoted the time to improving his education, by attending evening school, from which, it is his desire to record, that he gained much advantage, his elementary training being thus kept in practice, and a better appreciation of the value of education made him now the more industrious. In this respect he was happily situated, as the "Fair City" afforded ample opportunities for young men improving themselves.

"During my last year of apprenticeship," he writes, "I was afforded the opportunity of seeing a little of the first part of forestry, by being sent out in charge of some contract planting, which the firm had undertaken, the produce of which are now large trees. My engagement having now been fulfilled, I was sent as a journeyman to Invermay Gardens, then under the care of the veteran Mr. Muirhead, a renowned Pine and Grape grower in those days. Here I found a rich locality for alpine plants, many of which were new to me; but I only remained a short time. I next went to Kinnaird Castle, in Forfarshire, under Mr. Hovell, who, after I had been some time there, promoted me to the charge of the forcing department. I remained here for two years, when I was recommended to Mr. Easson, of Camperdown, Forfarshire; at that date one of the best-managed gardens in the country. Mr. Easson (now factor on the estate) was a most exemplary man and a good gardener. The first Earl of Camperdown used to say of him that 'he did more good than the parish minister.' After being here for some time I was placed in charge of the houses, which were pretty extensive, though Pine growing was being abandoned. I spent over two years here, and profited not a little, as a better managed place I have never seen, taking the allowance for doing so into account.

"I had been engaged for three months before I left to go to Oxenford Castle, Edinburgh, as foreman under the gardener, a man of most indomitable energy and tact, fond of landscape work. His time being fully occupied with the changes and improvements in the park and grounds, the management of the garden and houses consequently devolved a good deal upon me. Sir John Dalrymple had succeeded to the Earldom of Stair shortly before this as eighth Earl, and had set about remodelling the place.

"After seeing a good deal of rough work gone through in road-making, terracing, pulling down and building up, when nearly two years here I was recommended by the late Mr. M'Nab of the Royal Botanic Gardens, Edinburgh, as gardener to Lord Southampton, Whittlebury Lodge, Northamptonshire, where I stayed two years. Having saved a few

pounds in money, I took the advice of the late Mr. J. C. Loudon to some extent, and spent £40 in travelling and seeing all the principal gardens in and around London. I never regretted this outlay, and though not on the Continent, as Mr. Loudon advised, I profited considerably by seeing many of the best places in England.

“I was then offered the remodelling of a fine old place in Dorsetshire (Kingston House), once the residence of the famous Mr. Pitt, by Mr. Ferguson, of Aylesbury, who had undertaken the work and the supplying of the plants. I had to come to London before it was quite finished, and did not return; and being asked at this time to become a candidate for my present situation, I did so, and being successful in my application I entered upon my duties in September, 1848.

"I have had the honour to serve three successive Earls of Stair during the time I have been here—over twenty-eight years. They have all been great patrons of horticulture, and I have received every encouragement from them, and most of all from the present Earl, who has authorised me from time to time to renew the whole of the glass structures on the place upon more modern principles than hitherto, and otherwise permitted me to effect improvements in the place when necessary. During my gardening career I have endeavoured to have as few hobbies as possible (we all have some), dividing and devoting my energies as equally to all subjects under my care as circumstances would permit. I never was a keen competitor in the general acceptation of the word, but I have entered the lists occasionally, with what results the records of the Royal Horticultural of London and Royal Caledonian Horticultural Societies will testify. Certificates of merit and money prizes from the former, and medals from the latter, for collections of fruit and vegetables, at various times have been won. My great aim through life has been to make two blades of grass to grow where one grew before, and sometimes I have succeeded."

On the occasion of the fruit show at South Kensington on Nov. 6 and 7, 1861, we find, on reference to the *Proceedings of the Royal Horticultural Society*, i. 707, that Mr. Anderson carried off the first prize for a collection (twenty-two dishes) of Pears, thereby beating all England, though, as the Scottish Farmer observes, "Oxenford is by no means a land of Goshen, either as regards soil or climate." To him, "therefore, belongs the greater meed of credit for producing under the circumstances better Pears than those with which they were brought into competition, although grown in some of the very best gardens in England"—to wit, Frogmore and Heckfield. "Mr. Anderson, operating in an ungenial climate, has, like a wise man, consulted reason and science, and hence by these means has overcome the natural disadvantages by which he is beset. Now these means are both simple and rational, consisting of protecting the blossom in spring, and *frequently lifting the trees*, so as to keep their roots near the surface, that they may enjoy the fullest amount of solar heat." Mr. Anderson prefers root-lifting to root-pruning, and considers the lifting to be check enough upon over-luxuriance and late and imperfect ripening. The sorts of Pears exhibited as above, as we learn from Mr. Anderson, were these:—Beurre d'Aremberg, Beurre Diel, Beurre de Capiaumont, Beurre Clairgeau, Buchanan's Spring Beurre, Colmar, Colmar d'Aremberg, Crassane, Doyenne Gris, Duchesse d'AngouIeme, Easter Beurre, Flemish Beauty, Glou Morceau, King Edward's, Louise Bonne of Jersey, Marechal a la Cour, Marie Louise, Napoldon, Poire Neill, Rousse Lench, Susette de Bavay, Winter Nelis.

trellises, which, with the pots, were six feet in height, and two large plants of Dipladenia amabilis, and one of Cyrtoceras reflexum, greatly infested with mealy-bug. On reference to my diary, date Jan. 17, 1857, I find that the gardener took the Stephanotis off the trellis, rolled up the trailing shoots in a coil, and then plunged them in a copper of boiling water, taking them out instantly. The plants were entirely killed as far as the water touched them, but to the surprise of everyone present, the mealy-bug came out untouched. The Cyrtoceras shared the same fate; the Dipladenias came out with the mealy-bug unharmed. The trellises were afterwards washed with Gishurst Compound, and hung on trees in the shrubbery till required the following spring; the mealy-bug was then still alive. Petroleum and other insecticides now in use were unknown; it was all picking and sponging, which after all are the safest and surest methods. For mildew on Vines the best remedy is to take ½ lb. of flowers-of-sulphur, mix into thin paste as you would mustard, then add 4 gallons of clean water, well stirring it together, and standing it in the house where it is to be used for twelve hours, that is, till quite clear; in the morning ladle-out all the clear water into other vessels without disturbing the sulphur lying at the bottom, and syringe therewith the Grapes and foliage, or whatever is affected. This is a safe cure, and leaves no stain on berry or foliage. I consider hot water a dangerous remedy. I should think as bad as using a pan of burning sulphur. *Thos. Godfrey, Hillingdon.* [Mr. Mallett, who recommended heated water for destroying mildew and mealy-bug, did not say that he used it at the boiling-point—212°, Fahr., but something less than that, say, about 180°; neither did he dip his plants into a "copper of boiling water," a proceeding which the most inexperienced gardener would know to be dangerous to plant life. He stated that the water was applied by means of a syringe; and in its transit from one place to another, and passage through the air when driven out of the syringe, it would be greatly robbed of its heat. ED.]

FANCY PANSIES.—As "R. D." has told so clearly the story of the introduction of the Fancy Pansy into Britain, no doubt renewed interest will be felt in these beautiful hardy flowers, for of their size as plants we have very few that produce such grand blooms, so superbly marked, and coloured as Fancy Pansies do. I am induced because of this to ask for information, as to whence come into market at this time of the year in such immense numbers, such grand-flowered plants as are seen everywhere offered for sale. Do they come from across the Channel, or are they grown at home? and if the latter, are they raised from home-saved seed, or from imported seed? Also under what conditions is the seed sown and at what time, and how are the plants grown to produce such robustness and such giant and brilliant flowers? No strain anywhere gives finer, few give so fine; whilst I see plants of this description freely purchased and planted, yet I do not observe that they seem to have long lives. Does this arise from the changed conditions of culture to which subjected? are they grown during the winter in cold frames, and on very rich soil? If that be so, their robust character is explained, as is also the fact that after being planted in garden-soil for a few weeks, they seem to do so indifferently. Still, that the plants come from a grand strain there can be no doubt, and it may not be far wrong to assume that to induce them to thrive in gardens, it is needful to furnish them with culture somewhat similar to what they have enjoyed in the market-growing establishments. *A.*

A QUESTION.—Your correspondent "J. C.," at p. 400, laments the absence from modern gardens of certain flowers which were favourites of his, fifty years ago. He is also surprised that he does not see them offered in trade-lists. Having myself been familar with those plants half a century ago, I can sympathise with him, though we have much compensation in the possession of recent additions to our garden plants. I think, too, I can explain, if not justify, the disappearance of our old favourites. As botanists we can but remember with interest the charming little plant Yellow Violet, introduced by Mr. Veitch forty-five years ago, but we have now the more showy and more easily-cultivated yellow Violas for beds and borders. The "Double Walls" of those days were propagated only by cuttings, but now very fine Double Wallflowers are raised more easily and abundantly from seed, though I confess to a preference for the more compact and natural appearance of the plants we raised from cuttings. I do not remember the black-flowered Delphinium, but we see now a great variety of dark purple, indigo-blue, and brilliant light blue, all raised easily from seed. But "J. C." says, where are now the Hyacinths, Double Purple-Green Tips, Double Red Green Tips, and Double White Green Tips which, he says, he used to obtain of the late Mr. John Sutton, which I can quite believe, as this was my father, with whom I was then in partnership (fifty or sixty years ago), and I well remember the pretty Hyacinths he reminds me of, and which could still be procured in the trade if ordered. The disappearance of these old favourites is accounted for by the fact that the present day demand is for the most showy and the most free-growing of flowers for beds and borders, and the nurseryman or florist finds it to his interest to cultivate and advertise those things which best meet the public demand. It is now more than ten years since I retired from the business firm of Sutton & Sons, but the interesting enquiry of your correspondent, "J. C.," tempts me to offer a few notes to the *Gardeners' Chronicle*, with which I have corresponded from its foundation, fifty-eight years ago. *Martin Hope Sutton.*

PROSPECTS OF THE FRUIT CROPS IN SHROPSHIRE.—There is every prospect of an abundant crop of most kinds of fruit this year in Shropshire, with the exception of Plums and Damsons, and in some parts, Gooseberries. In some districts the crops of Gooseberries are very good, and in others almost a total failure, owing to the severe frosts experienced in spring. The Plum and Damson-trees were heavily laden with blossoms in spring, and gave promise of abundant crops of fruit; but the cold spring proved too much for them, and we may say there is generally a total failure. I have visited many parts of Shropshire, and only very locally could anything worth calling a crop be found; the fine gardens at Sundorne Castle, so ably managed by Mr. Phillips, the head gardener, being one of these exceptions. Here, Plums upon the walls are an abundant crop. The Apricots and Peaches—the latter especially being heavily laden with fruit; in fact, fruit of all descriptions will be very plentiful. This county is noted for its Damsons, and in good years the crop is a valuable one especially to cottagers, and the disappointment is great this year, as there was such an early promise of abundant crops. The trees also are terribly infested with the Plum-aphis, which curls up the leaves, causing crippled growth and otherwise injuring the trees. Apples and Pears are much above the average; Strawberries also are a very abundant crop, notwithstanding some of the first blossoms were destroyed by the early frosts of spring. The glorious rains we are now having will do much to secure fine fruit and a continuous supply. *A. Gaut, Shrewsbury.*

Obituary.

THE LATE J. CRAGG.—As gardener to the late A. Heine, Esq., the deceased was well known as a thorough good all-round man, a capital hand with bouquets, vases, and table-decorations, very successful with Orchids—at one show, if my memory serves me aright, he carried off every 1st prize in the open and amateur classes at Old Trafford, when competition was keener than is the case at the present time. He was a good Chrysanthemum grower and exhibitor, and had excellent taste in forming groups of plants for effect. I ever found him a pleasant companion, and a most unselfish and kind-hearted neighbour. My mind runs over those connected with some of the big shows at Old Trafford long ago, and of that number Messrs. T. Baines, W. Cole, W. Milford, G. Toll, T. Hubberstey, J. Jones, A. Beesley, G. Beddoes, B. Findlay have all passed away, the greater number, comparatively speaking, in middle age, some scarcely that; and to the number we may now add J. Cragg, who, after about fifteen years' service at Birchfield, has succumbed at the age of forty-six years. *W. Swan.*

PETER DRUMMOND.—Only a fortnight after attending the funeral of the late Mr. Kelway, occurred the sudden death at the age of sixty-six, of Mr. Peter Drummond, who had been foreman at the Langport Nurseries of Messrs. Kelway & Son for a period of twenty-six years. As a testimony to the character of the deceased gardener, we reproduce the following appreciative description of him by the firm itself—

"Mr. Drummond's death has been a severely-felt loss to us; we mourn a man of forceful intellect and inventive mind, a most clever cultivator, a charming personality, a devoted friend, and most faithful servant."

Mr. Drummond's father, writes Mr. Croucher, our valued correspondent at Ochtertyre, N.B., was gardener at this Scottish domain from 1842 to 1857, and was Mr. Croucher's immediate predecessor. The gardener there previous to Mr. Drummond remained over fifty years. Accordingly there have only been three gardeners at Ochtertyre since the year 1790. Ochtertyre is the residence of Sir P. K. Murray, Bart.

JAMES ANDERSON.—We regret to have to announce the death of Mr. James Anderson, who expired at Glasgow on June 16, at the age of sixty-seven years, after an illness extending over some eighteen months. Mr. Anderson was well known as having been gardener for many years to T. Dawson, Esq., Meadowbank, Uddingstone, N.B., where there was one of the finest collections of Orchids of the time, and in which many that are still held in high esteem made their first appearance, and notably Odontoglossum × Andersonianum and Lælia anceps Dawsoni. Mr. Anderson was a very successful cultivator, and also exhibited some very remarkable specimens, securing the very rare honour of the Lindley Medal, and many other awards. After Mr. Dawson's death, Mr. Anderson established himself near Glasgow as a landscape gardener and horticultural expert, but soon removed to the neighbourhood of Manchester, and many gentlemen availed themselves of his services as an adviser in gardening matters. He was also employed on the Epping Forest Commission, and was for many years a valued correspondent of this journal. The deceased was for the period of its short existence editor of the *Northern Gardener* at its commencement in Edinburgh, and later at Manchester. He also brought out a bulky work entitled *The Practical Gardener.*

NURSERY NOTES.

KNAP HILL NURSERY IN JUNE.

To anyone interested in Rhododendrons and Azaleas, one can imagine no better day of education and pleasure combined than a visit to the Knap Hill Nursery during the early days of June. There is not, I suppose, within the three kingdoms a place where so large an area is covered with Rhododendrons, not merely stuff for selling by the hundred, but magnificent specimens, some of which in their height and spread of branches, as well as in the thickness of their stems, may rank as small trees. As the nursery is approached from Woking Station, a foretaste of the feast of colour is obtained from the high road, whence glimpses can be caught, low in the distance, of great stretches of Rhododendrons in bloom—a scene not only very beautiful, but peculiarly striking, set, as it is, amidst the meadows and hedgerows of pastoral Surrey. When the nursery is reached there is seen stretching away through it a straight avenue, close upon a mile in length, bordered for the most part by towering masses of Rhododendrons, among which the variety album elegans is prominent in huge bushes 15 feet or so high. From this avenue we make incursions on either side, traversing quarter after quarter of the nursery, still of the finest varieties of Rhododendrons in full bloom, till we are almost bewildered by the glowing masses of colour that close in on every side. Purple of various shades is still the prevailing colour among garden Rhododendrons, but here there is every range of colour, from pure white to vivid

by the gases inhaled or exhaled during growth, or whether there is some other reason—has not yet, so far as I am aware, been determined; but the fact is known to every gardener.

May 4th.—My Clivias (Imantophyllums) flowered very irregularly last year—some in spring, some in summer, some in autumn. On some of the latest I allowed the seedpods to remain, and they are still on, though the plants were in a cold house all the winter. There are about eight pods on a stalk, each as large as a Walnut; they are wax-like in texture, orange or scarlet in colour, decidedly handsome—almost as handsome as the flowers. It was a mistake to leave them on, kind friends assure me; but they were wanted for decoration when flowers were scarce. I had another reason. I admit that seedpods probably do weaken plants to some extent, but I want to know to what extent. If these Clivias flower this year, and flower as well as last, the injury will not be very considerable; if they do not, I shall have gained experience. It is always worth buying—at a fair price.

May 5th.—Last year, my diary tells me, I heard the first cuckoo on April 27th, and the first nightingale, and saw the first swallow—unusually late—on May 1st. I cannot give the corresponding dates for the present year, but vegetation is certainly more backward—about a week more backward, so far as I can judge. Not that this is a disadvantage; on the other hand, it may prove beneficial if it keeps back tender plants until they are safe from late frosts. It would, however, be imprudent to relax the ordinary precautions—this year especially. Two or three weeks must elapse before we can feel that we are out of danger.

May 6th.—In the course of some desultory reading, I have just discovered "a well-known fact." I am afraid many of us never discover anything else, and then rather late in the day. "It is a well-known fact," says Professor Carr, in a very interesting paper, "that Lichens are not single, independent plants, but are constituted by the union of a fungus and an alga so intimately associated as to appear to form a single individual. The alga, in virtue of its possessing chlorophyll, can supply the fungal constituent with organic food, while the fungus provides the algal constituent with water and mineral salts. At first sight, therefore, the association appears to be one of mutualism, *i.e.*, a partnership fraught with equal benefit to the parties associated; but it appears that, while the fungus cannot exist apart from the alga, the latter can, and does, live independently. Such a relation may be likened to that of master and servant rather than of partners." That is certainly very remarkable.

May 7th.—The hairy leaves of the Primula naturally suggest the question, What is their object? Possibly the same as that of the hairs and spines with which desert plants are provided—for the purpose of increasing their scanty water supply by causing the deposition of moisture.

H. C. Davidson.

Mr. Anderson in the Conservatory.

Famous Gardeners at Home.

No. 136.—MR. THOMAS ANDERSON, AT THE GARDENS, LALEHAM HOUSE, STAINES.

When I asked for permission to inspect the gardens at Laleham House, I received a most courteous answer informing me that Lord and Lady Lucan were pleased to comply with my request; and on the occasion of my visit Lord Lucan was kind enough to show me some of the beautiful and lofty rooms in the mansion, adorned with paintings—including one of his father, the third Lord Lucan, who commanded the cavalry in the Crimean War—and with statuary by Thorwaldsen, the famous sculptor. Both Lord and Lady Lucan take a great interest in the gardens, and I am indebted to them for the use of the photographs which illustrate the letterpress of this interview.

The head gardener at Laleham is Mr. Thomas Anderson, and under his guidance I first of all turned my attention to the splendid specimens of Cedars of Lebanon close to the house.

"They were, probably," he said, "planted about a century ago, at the time the house itself was erected. Next to the Cedars, the Limes and the three fine Copper Beeches are most admired."

"You do not go in for any carpet-bedding?"

"No. As you see, of the two beds near the house, one consists of Eucharis, Yuccas, Kalmias, and Ponticum Rhododendrons, while the other is planted with bulbs in the spring, and herbaceous plants in the summer. We started with Crocuses and Scillas, and followed with Daffodils, Polyanthus, Anemones, Fritillarias, and Tulips. The herbaceous plants are maintained up to the middle of August."

"I suppose you decorate the colonnade with flowers in the summer?"

"We place boxes in it, and the effect is very pretty. The vases along the pedestals are filled with bedding plants in their order of flowering, including Geranium and Ivy-leaf Pelargoniums, Petunias, and other creeping plants."

"You have an Orange tree just coming into flower in the conservatory?"

"Yes, and about the end of May we shall transfer it to the centre of the Dutch garden. Spiræa is just now a feature in the conservatory. We grow plumosa, japonica, astilboides, and japonica compacta. There are several Palms, some rather good Ferns, and a general collection of decorative plants and climbers here, but, of course, we are constantly changing."

Then we went into the Dutch garden, which is very tastefully laid out, the contents being chiefly Wallflowers, Box, Golden Privet, Silver Euonymus, Portugal Laurels, and Aucubas. In summer it is bedded out with Geraniums, etc., the walls at the side being covered with Honeysuckle and Jasminum. From the Dutch garden we proceeded to the Rosery.

"When was the Rosery made?" I inquired.

"About fourteen years ago; but it was planted up, altered, and shaped about three years ago. There are mixed varieties of Roses in each bed."

"Can you give me any idea as to the number?"

"I should think that there are close upon six hundred. In the larger beds there are Hybrid Tea and Perpetuals. The principal varieties are Her Majesty, Salamander, Mrs. R. G. Sharman Crawford, Alfred Colomb, Marie Baumann, Cheshunt Scarlet, Margaret Dickson, Heinrich Schultheis, Alfred K. Williams, Harrison Weir, Victor Hugo (a quantity), Clio, Tom Wood (a

The Entrance to Laleham House, Showing Massive Portico.

prime favourite), Grand Mogul, Senator Belle, Brightness of Cheshunt, Ulrich Brunner, Madame Eugene Verdier, Duke of Wellington, Lord Macaulay (a fine colour), and Gustave Piganeau."

"Are there Tea varieties in the round beds?"

"Yes, including Bridesmaid, Comtesse de Nadaillac, Muriel Graham, Maman Cochet, The Bride, Lady Mary Fitzwilliam, Ernest Metz, President, Souvenir de S. A. Prince, and Madame Lambard. The best of the climbers are Blairii No. II., White and Yellow Rambler, Setina, Thalia (yellow), and Euphrosyne. We have a quantity of Crimson Rambler on trellis in other parts of the garden—it makes a fine bed pegged down. I have done this for two years. The bed is edged by Pansies, which last nearly until the Crimson Rambler comes into bloom."

Passing a singularly nice Holly hedge, planted thirteen years ago, we came to an admirably arranged little orchard, with beds on each side. Observing an old Mulberry tree, with plants of Primroses in the stems, I asked how long the latter had grown there, and Mr. Anderson replied that he thought about four years.

"What fruit do you grow in the orchard?"

"Apples, Pears, and Plums. The Apples are cooking varieties, and among the best are Beauty of Kent, Blenheim Orange, Cox's Pomona, Wellington, Dutch Codling, Gloria Mundi, Golden Noble, Golden Spire, Hambledon Deux Ans (a very good Apple), Mére de Ménage, Nelson Codling, Peasgood's Nonsuch, Pott's Seedling, and Stone's (or Loddington) Seedling. The Pears include a few trees of the old Windsor variety, and Victoria Plums."

THE THATCHED LODGE ENTRANCE TO LALEHAM HOUSE.

Crossing over the lawn, we had a peep at the river—there is a landing stage belonging to Laleham House—and on the way back I noticed a number of blue Primroses. Mr. Anderson mentioned that he introduced them nine years ago, when they first came out, but added that he prefers the yellow variety. Along the private walk to the garden from the lawn, which is called the Lynch Walk, are Lilacs, Hollies, Yews, and various shrubs, sheltered from the east wind by a plantation. The trees here were planted, but all the undergrowth is natural.

"The acreage of the gardens must be very considerable," I remarked, as we continued our inspection.

"There are some twenty acres, and the gardens being only divided from the park by a ha-ha hedge make the former look larger. The estate itself is about twelve hundred acres."

"Any Nuts?"

"Yes, there is a row of Kentish Cobs, and Filberts, planted alternately, under the Yew hedge. The reason we mix them is that there is more male bloom among Filberts than among Cobs, and that with the mixture we get a better crop of Nuts."

"How long is the wall facing the orchard?"

"Five hundred feet. It faces south, and with the exception of a few Apricot trees it is planted entirely with Peaches. Several of these have been put in lately, including Late Devonian, which has not yet fruited here. Others are Barrington, Royal George, Hale's Early, Bellegarde, Sea Eagle, Golden Eagle, Violet Hative, Dymond, Royal George, and Alexander. We have also the Victoria Nectarine."

"You seem to have a large bed devoted to herbs?"

"We use a large quantity, especially Marjoram, Sage, Lemon and common Thyme, Mint, and Tarragon."

Then we entered the kitchen garden proper, which is very extensive, and excellently laid out. A Crimson Rambler pergola is very ornamental, but before looking round the outside we spent some time in the houses. Glass is not a great feature at Laleham, but there is a sufficient quantity. Entering the late Vinery, I asked the varieties grown.

"Lady Hutt is one. We get Grapes about Christmas. The other varieties are Appley Towers, Alicante, Alnwick Seedling, Gros Maroc, and Gros Colmar."

"In this Vinery, I observed, you have a number of Guelder Roses."

"We grow about forty of the Viburnum Opulas in pots. They are very useful for church purposes, and we decorate Laleham church. They are rooted from cuttings, and grown on in a house not too warm. The moisture of the Vinery suits them."

"When did they start flowering?"

"In March. They were flowered first in 'forty-eight' pots, then in 'twenty-fours,' and they are now in 'sixteens.' We have had them two years in pots. They have never been planted out. It is essential to give Guelder Roses a season's rest, by which I mean that they should not be flowered two years in succession. The Deutzias have also been in this Vinery since the second week in March."

"And bedding plants in the early stages?"

"Yes, including Lobelias, Begonias, Verbenas, and Lantanas. The Lantanas, which are of various colours, make beautiful beds in the Dutch garden, and are useful for pot work."

"Are they easy to grow?"

"They are raised from seed, and flowered the same season. The flower is like the Verbena. These are the dwarf varieties, and a great improvement upon the old-fashioned Lantanas, which grow three or four feet high. The full growth of these does not exceed seven or eight inches."

"What Grapes do you cultivate in the early Vinery?"

"Muscat Hamburgh, Foster's Seedling, Black Hamburgh, and Madresfield Court. With regard to the fruit, which are setting well, I fertilise the branches with Pampas Grass to make sure of them."

"You have some Orchids here?"

"A few. Dendrobium Wardianum has flowered very well; also the D. densiflorum album, known generally as Schroderii. Last year we had seventeen trusses on one plant of the latter. Cypripediums, Cœlogynes, and Vandas do very well with us."

"Is the middle Vinery devoted entirely to Muscats?"

"Except one Vine of Canon Hall, they are all Muscats of Alexandria. On the back stage are about fifty pots of Royal Sovereign Strawberries which I like best for forcing."

"Then, there are the Geraniums for bedding. Which varieties do you like best?"

"I depend a great deal upon Gibbons, Jacoby, and Vesuvius. Other good varieties are Flower of Spring, Happy Thought, D. P. Ford, Crystal Palace Gem, Souvenir de Charles Turner, and the old Double Pink. In this house, too, there are about five dozen Streptocarpus hybrids, Veitch's latest strains. Some are more pink than blue, inclining to red; and others are pure white. They require a little heat after repotting, and later on they will have cold treatment. When they flower we put them in the greenhouse, or conservatory."

"I see that you have some fine flowers of the yellow Arum."

"We have about twenty plants. They require more heat than the white variety, and we start them in a temperature of from fifty to sixty degrees. When they show spikes we transfer them to the greenhouse. After they have done flowering we put them below the greenhouse stage, and leave them there until we pot them afresh. The white Arums, on the contrary, are put out of doors after they have flowered, and left there until they are potted on. Before I gave

the yellow variety warmer treatment I lost a few of them.

"We also," continued Mr. Anderson, "pot a number of herbaceous Calceolarias (Veitch's strain), Marguerites, Tea Roses, Lilium longiflorum, Gladioli, and Cytisus."

"What about Carnations?"

"There are a hundred and fifty young plants, and three dozen two years old. The old pink variety is a great favourite, and among others are Churchwarden, Robert Burns, and Lady Rose."

"How many Violets do you force in the pits?"

"About five hundred plants, Marie Louise and Neapolitan. Later on we grow Cucumbers here. The varieties are Rochford and Telegraph. We find Veitch's Early Favourite a good French Bean for forcing. Only the green-fleshed Melons are grown; Law's Favourite and Eastnor Castle are the principal varieties; and of Tomatoes I prefer Frogmore Selected, Ham Green, and, for winter, Up-to-Date."

"Broccoli appears to be a feature outside?"

"We grow Self-Protecting, Veitch's Fine Spring White, Chelsea Favourite, Main Crop, Model, and Methven's June. For five years I have begun with Spring White in July, and, if the weather has been at all favourable, I have continued cutting until the end of May or the beginning of June, and I, therefore, strongly recommend these varieties."

"I should like to know your system."

"We plant in the undug ground after the Strawberry plants have been cleared off. If the weather is very dry, and the ground hard, we plant with a crowbar, and puddle the roots in. To this, chiefly, I attribute our success. The plants make nice, steady, firm growth, and they stand either severe or damp weather. We never lose more than five per cent. of the crop."

"Which Pea do you prefer?"

"The Autocrat is particularly good for late purposes, and has a fine flavour. I have had them picked in October. The Early London and Veitch's Autumn Giant are among the best Cauliflowers, and for Cabbages we depend considerably upon Ellam's Early, London Market, and Mein's No. 1."

"There remains the fruit in the kitchen garden."

"Apples and Pears are grown on espaliers and pyramids, and at the back of the espaliers is a row of Sweet Peas, while a herbaceous border runs right along both sides. The dessert Apples include Beauty of Bath, Court of Wick, Cockle's Pippin, Cox's Orange Pippin, Dutch Mignonne, Ferry Pippin, King of Tompkins County, Pineapple Russet, Scarlet Nonpareil, Worcester Pearmain, and Yellow Ingestrie."

"And you have also Selwood's Reinette Apple?"

"Yes, our Selwood's Reinette Apples are rather famous, and equal in appearance to the best American. The trees are old, but healthy, and bear freely. The variety received its name from a nurseryman at Queen's Elm, Little Chelsea, in the eighteenth century. Our soil is exceptionally good for Apples."

"Which are the best Pears on the espaliers and pyramids?"

"Here are a dozen: Autumn Nelis, Beurré de Bosc, Beurré Alexander Lucas, Beurré Diel, Catillac, Comte de Lamy, Doyenné du Comice, Fondante d'Automne, Glou Morceau, Josephine de Malines, and Madame Treyve. The Peaches on the walls include, in addition to those I have already named, Condor and Osprey."

"You only grow Peaches outside?"

"No fruit, except Grapes, is grown under glass. The Plums and Damsons (dessert and cooking) include Belgian Purple, Belle de Louvain, Bryanston Greengage, Coe's Golden Drop, Czar, the Cluster, or Farleigh Damson, Denniston's Superb, Diamond, Rivers' Early Favourite, Royal Duke, Pond's Seedling, and Prince Robert."

"How many years have you been head gardener at Laleham?"

"Sixteen. I started my gardening experience in Scotland, at Rossie Priory, in Perthshire. After serving my apprenticeship there for five years, I went for a year to Baldevan House, Forfarshire, then for a year to Amesfield House, Haddingtonshire, and next to Penicuik House, Midlothian. At the end of three years I came to London for a season at Veitch's nursery, and then went to Farnley, Hull, Yorkshire. I was there two years, and was next for a year at Warriston Nursery, Edinburgh. I was afterwards foreman for a year at Raith, Kirkcaldy, and then head gardener for seven years and a half at Broad Meadows, Selkirkshire, whence I came to Laleham House."

ALFRED WILCOX.

Letters from a Lady Gardener.

SOME RARE GARDEN BULBS.

DEAR KATE.—The garden is now very interesting, for all sorts of uncommon bulbs, etc., are appearing in it. I cannot understand how people can have the patience to go on year after year growing just the same things in their flower-beds; I like to have a surprise now and then, when a rare and beautiful flower unfolds its blossoms for the first time in my little domain. So we grow all manner of queer things, but all are lovely.

The Camassias, for instance, with spikes of starry flowers in creamy white (C. Leichtlini alba), or blue (C. esculenta), are now throwing up strong spikes of bloom, having lived here, and multiplied themselves in our borders, for several years. They are related to the Hyacinths and Scillas, but some of them grow to the height of two feet, and are very effective in the early spring. All they need is a well-drained, gravelly soil, and a sunny position where they can ripen their bulbs; for they come from South America, and consequently enjoy warmth.

TIGRIDIA ALBA.

Then there are the Alstrœmerias, which make fine groups of colour in the garden, especially A. aurea, the hardiest of them all, which grows tall, and produces a mass of golden bloom, most effective for cutting, and also in the garden, so that one can scarcely have too much of it. Alstrœmeria Chinensis is in many tints of apricot and pink, also very beautiful, and this, too, increases in my garden, and forms great clumps of bloom; but we indulge it with a layer of ashes in winter, to keep out the worst of the frost, and when we remove these in March, we give the plants a good mulch of old hotbed stuff, mixed with soot and a little soil, instead, on which it thrives. A. Pelegrina is more delicate, and we find it best to grow this in a pot, sheltering it in a cold glass porch in the winter, from which, however, sharp frost is excluded, for we put a good lamp on the floor of it on frosty nights. The white variety (alba) of Pelegrina is the best; the other is in pink, but not quite so lovely as the white one, I think. It can be repotted when dormant, in the autumn, and given good, rich loam, leaf-mould and soot, without fresh manure.

We have been planting out a lot of young Tigridias, which we raised from seed a year or two ago; these gorgeous flowers, of the same class as the Irises, are a feast of colour in the garden from July to September. The blossoms only last one day, but they are produced in succession for many weeks, and they are extraordinarily beautiful, in rich and delicate hues, difficult to describe. The typical flower (T. pavonia) is scarlet, with tiger-spots in deep maroon-black; then there is T. rosea, in the loveliest shade of pale pink, with crimson markings; T. aurea, in tints of yellow and rich brown; T. alba, creamy white, with deep, red spots; T. immaculata, in pure white, etc., etc.; they look like a flight of splendid South American butterflies when in blossom, more than anything else. Here they grow and increase from year to year in the warm border just outside the conservatory; and we have planted the lovely Pohlia Platensis, too, in the same warm border, which is now coming up strongly. This is a flower of the same shape as a Tigridia, but in deep sky-blue (so it is said), and we are looking forward to this rare tint appearing amongst the mass of Tigridias in summer; for it ought to be most effective with all those warm colours. These bulbs are put in during March and April, but it may not be too late to get them yet, if you lose no time about it.

Then there are the lovely Star Tulips (Calochorti), of which the best varieties are the Eldorado-Venustus group; and Vesta, in creamy-white, with blotches at the base of each petal, like those on a peacock's feather, is one of the loveliest of these. The bulbs of the Calochortus have to be planted in September or October, in a well-drained position; and it is a good plan to cover them with a pane of glass, raised on four small pots, to keep them fairly dry in winter, for they, too, come from South America. They don't object to the cold nearly so much as the wet soil of our islands at that time, and unless they are protected by glass in this way they are apt to rot, instead of growing. The flowers appear in the summer, but almost without leaves, the foliage being small and insignificant; so that it is a good plan to carpet the surrounding space with Pansies, or some dwarf annual, when the lovely flowers will look their best. As soon as the blooms are over, however, the raised glass should be put on again, as they need more warmth than we usually get in the autumn to ripen their bulbs. You can take up the bulbs for a short time in the autumn, if you like, but I find they do best in the soil, if kept fairly dry, and they should be replanted not later than the first week in October, adding sand and powdered charcoal to the soil (which must be fairly good), and putting the little bulbs two inches below the surface.

I will tell you about some more of our bulbs next week; but now I must remind you of various things which need attention at this very busy time of the year.

Anderson, William (1766–1846), horticulturist, was born in Easter Warrington, Edinburgh, the son of a forester and gardener to a Jacobite laird in the western highlands who had helped Charles Edward, the Young Pretender, to escape after the 1745 rising. He was known to be working in some nurseries near Edinburgh about 1790; he later made his way to London, and in 1793 became gardener to James Vere, of Kensington Gore, a wealthy silk merchant who had a large collection of plants.

In 1814 the Worshipful Society of Apothecaries appointed Anderson gardener—a title changed during his occupancy of the office to curator—of the Chelsea Physic Garden, a post which he filled until his death. He quickly revived the garden from the state of neglect into which it had fallen during the Napoleonic wars. He introduced new plants, sowed thousands of seeds, and made various improvements, such as using sand to convey warmth to the plants. He repaired the dilapidated buildings, and changed the former culinary garden into one for instructive horticulture. Anderson was elected an associate of the Linnean Society in 1798, and he became a fellow in 1815. He contributed various papers on horticultural subjects to the *Gardener's Magazine* and the *Transactions of the Horticultural Society*, including 'On the introduction and cultivation of a variety of *Azalea Indica*' (2, 1817, 258).

Anderson was tall and burly, and of rough appearance and manners, but kind. He lived alone and had no known relatives. He possessed a diamond ring, presented by the emperor of Russia in return for his care of some valuable orange trees. Anderson died intestate at St George's Hospital, Chelsea, London, on 6 October 1846, and was buried in the churchyard of the Old Church, Chelsea.

The Use of Bacterial Cultures.

April 23rd.—The experiments of Professor Bottomley with nitrifying bacteria (previously described in these notes) have led to various cultures being put on the market, and, as they can now be obtained very cheaply, they are sure to be used more or less indiscriminately, the inevitable result being disappointment. I will, therefore, repeat the warning which I gave some months ago. These cultures will increase certain leguminous crops, such as Peas and Beans, under certain conditions. Ordinary

MR. ALFRED ANDREWS.

garden soil contains plenty of the nitrifying bacteria; nothing, therefore, is gained by introducing more of them. It is only in poor soil that any effect will be seen. And no effect will be seen even there unless the other plant-ingredients, such as phosphates and potash, are present in sufficient quantities; if they are not, they also must be added. The largest plum-pudding which you can make depends on the amount of the ingredient of which you have proportionately least, not on the one of which you have most; it is useless having a stone of flour if you have only a pound of Raisins. And so it is with plants. It is merely waste to supply them with large quantities of nitrogen unless the other ingredients are brought up to the same level. They cannot use the excess, and it drains away into the lower strata, where it is lost, even to the crops that follow, for their roots cannot reach it. It will be seen, then, that the application of bacterial cultures to the land has no practical value except within certain narrow limits, and that within those limits certain precautions must be observed, otherwise the result is bound to be disappointing.

Mildew and its Cure.

April 24th.—Though mildew is such a common disease, it is, fortunately, one which may be easily cured. For the parasitic fungus which causes it, unlike those which cause the diseases among Hollyhocks and Potatoes, develops outside the tissues, and can therefore be destroyed by spraying. Bordeaux mixture has been used with complete success for the powdery mildew of Peas, but a solution of sulphide of potassium would be simpler and safer, and probably equally efficacious.

April 25th.—Kent is a beautiful county at all seasons, but never more beautiful than in spring, when the Cherry is in bloom. It is no wonder that the Japanese love these exquisite flowers, placing them next to Chrysanthemums. In England, however, we are generally content with admiring them on the trees. For the sake of the fruit, they are seldom gathered, but where a spray or two can be spared, they look charming in vases.

H. C. DAVIDSON.

The Gardens of the Hon. William Lowther.

INTERVIEW WITH MR. ALFRED ANDREWS, AT CAMPSEA ASHE HIGH HOUSE, WICKHAM MARKET.

AMONGST gardens in the county of Suffolk none excel in interest those of Campsea Ashe High House, the seat of the Hon. William Lowther, which I visited, by the courtesy of the owner, towards the end of March. Moreover, Mr. Alfred Andrews, the head gardener, who has been in his present position just twenty-one years, and was previously foreman at Shrubland Hall, is well known in the horticultural world as a singularly successful exhibitor. Happily, the weather was favourable, and the sun, shining brightly on the handsome mansion, invested its surroundings with the brightness which always constitutes a charm.

How to Get Masses of Colour.

"There is one thing you might keep in mind," said Mr. Andrews, as we passed through the entrance gate to the sunk garden, "we go in for masses of colour and variety of flowers, but not for specialities. I am a strong believer in all-round gardening."

"What do you have in the sunk garden for summer flowering?"

"Tall-growing herbaceous plants, like Phlox, Asters, Tritomas, Pentstemons, and Antirrhinums and Hollyhocks, in the four main beds. The last do well with us, and we often get them without a spot. Campsea Ashe Pink was raised here by me; I brought the seed from Shrubland Hall. The beds are edged with Calceolarias amplexicaula. The round bed in the centre, which is changed every year, is now filled with giant Pentstemons. Clematis Jackmanii superba climbs right up to the top of the Hall, and at the foot is planted Solanum jasminioides, whose white flowers are just becoming visible. The background, as you see, consists of Acers (some of them very handsome), the Dartmouth Crab, and Cotoneaster frigida."

"Do you retard any of the plants to get them late?"

"Yes, I cut a lot of them back, especially the Phlox and Hollyhock. By this means we have a show of flower as late as October, when the shooting season begins. We used to have Geraniums and Fuchsias here, but they were not tall enough to be seen. Now, a blaze of colour attracts attention immediately anyone enters the gates. At the four points of this garden the Tritomas are always conspicuous."

"You have more Acers on the other side of the lawn?"

"Acers are quite a feature. They came from Japan. You will notice that there is no Ivy on the trees. We cut it all away."

The Treatment of Pampas Grass.

"I notice, too, that Pampas Grass flourishes."

"It is a great help to us. We have about forty clumps in different places. I have just been adding to the quantity. Pampas Grass lights up the place in October, and, in fact, flowers beautifully all through the autumn."

"Do the clumps require much attention?"

"I trim them in February, and then give them a good soaking of sewage. They need nothing more."

"What is the nature of your soil?"

"A mixture of loam and sand. It is good soil. The bed where the Laburnums stand, on a slope, with Crimson Rambler Roses on the stems, is made up of the hybrid Nicotianas, chosen entirely with a view to wealth of colour, the shades represented being crimson, scarlet, white, pink, and violet. They keep in flower up to November. With regard to Acers, we are now approaching the Japanese garden, in which you will see many more."

CAMPSEA ASHE HIGH HOUSE, WICKHAM MARKET.

The Japanese Garden.

"You have succeeded in making it very realistic."

"We have done our best, not omitting the

tea-house, which is thatched with Heather from the common. The bedding is arranged in the shape of a lantern. There are steps of stone on the grass to walk over, and a house for the Japanese pheasants. Many of the Acers and other plants in this garden were brought by Sir Gerard Lowther from Tokio. Bamboos do as well as the Acers, especially anceps, metake, and nitida. Yuccas and the variegated Golden Privet also thrive."

"Are all the beds planted with Roses?"

"Practically. There are two beds of Rosa rugosa, the other six being Hybrid Teas, Mildred Grant, Lord Roberts, Gruss an Teplitz, Marie van Houtte, Frau Karl Druschki, and Mark Twain. These six beds are edged with pink Violas. The Roses at the entrance are Wichurian, with Paul Néron in the centre, and the lofty pole in the middle of the garden is planted with white and blue Clematis. The tints of the Acers are lovely, and the vigour of the trees is wonderful."

Decorative Plants for Tubs.

Then, passing the extensive bowling green, shut in by clipped Yew hedges, which form ornamental walls, with Roses Lamarque, Ideal, and Fellenberg, we discussed the creepers on the mansion.

"These include," said Mr. Andrews, "Magnolia grandiflora, Jasminum primulinum, Pyrus japonica, Solanum jasminioides, scarlet Honeysuckle, and Roses, chiefly Devoniensis. Planted in marble tubs are Roses Dr. Grill and W. A. Richardson, also Garrya elliptica, and other tubs contain Heliotrope Countess Minto (the dwarf variety). At the entrance, and all round the house, we plant Chrysanthemums, which flower up to Christmas. Tropæolum speciosum does well in the dark corners, and in the square bed under the dining-room window are two plants of Acer negundo variegata, with Clematis climbing in amongst them. Then there is a bed with a row of Liliums, Salvia patens, a band of Verbenas (Princess of Wales), and a border of Violas. This bed is taken up every year."

"Plants in tubs seem to be very numerous."

"I suppose we have quite a hundred. The tubs are all made of old paraffin casks, painted white."

"But how do you fill so many?"

"Largely with Hydrangeas, which are from four to five feet through. Campanula pyramidalis, Agapanthus, Solanum jasminioides, Fuchsias in variety, Geranium Charles Turner, Humeas elegans (eight plants in a tub), Lithospermums, Lilium auratum, and Calceolarias Berberi are used for this purpose, and they all do well. The other bed near the mansion contains Escallonias as bushes, and is planted with Antirrhinums Scarlet Defiance, having on the wall behind more Clematis, Pyracantha, Choisya ternata, and Eucalyptus Gunnii. On the back wall, Climbing Devoniensis there grows over the library windows, and the white Jasminum and Ampelopsis Veitchii are the other creepers. Here, we face the cricket ground, and on the other side of the long moat is a fence of English Yews."

Treatment of Bamboos.

"Have you many Nymphæas in the moat?"

"Half a score of clumps of N. rosea, N. odorata, N. alba, and N. Ellisiana; also a clump of Aponogeton, which came from the Modder River. On one side of the moat are clumps of Pampas Grass, varied with clumps of Monthly Roses, which flower almost to the end of the year, the best being Fellenberg. There are also clumps of Bamboos. I find that, so long as Bamboos are given a good start, they will grow anywhere."

"Have you any particular method of treatment?"

"We take the clumps up in March, and get them into pots, keeping them in a cold house till they begin to make roots, planting them out the third week in April, with rotten rubbish and an accumulation of earth.

"You may like," continued Mr. Andrews, "to note the bed under the Cedar, forming a hill. It is entirely planted with six varieties of Antirrhinums—Sutton's Terra-cotta, Cloth of Gold, Chamois (silver), Snow Queen (white), and Sunset (pink). In the centre is an Acer, with Clematis Jackmanii superba, dotted with clumps of Tritoma uvaria, a very free-flowering variety."

"Is there anything special near the smaller moat?"

"At the end of it there is a quantity of Chrysanthemum maximum The Speaker, a variety which was raised here in 1903. The plants begin to flower in July, and continue until October. These, with Tritomas, Astilbe Davidii, clumps of Iris Kæmpferi, Polygonum amplexicaule, line the banks of the moat. To finish the pleasure gardens, you might mention that under the kitchen garden wall there is a border of Bamboos sixty yards long, and they are so thick that a thousand could be cut without being missed. At the entrance to the kitchen garden itself is a fine clump of Berberis vulgaris, which is at its best in September. The Cedars on the lawn are very handsome, and, as you can see, all the better for not being propped. Other trees include a grand Copper Beech, fine specimens of Ilex, a Mulberry tree, and a very rare tree, Celtis australis, or the Nettle tree, with a bark like metal."

THE CENTRAL WALK IN THE KITCHEN GARDEN AT CAMPSEA ASHE.

The Fruit and Flower Garden.

"Your kitchen garden appears to be quite unusual in character?"

"It has really ceased to be a kitchen garden in the ordinary sense, and is exclusively devoted to flowers and fruit, clumps, bands, and borders of the latter being the great feature. Through the centre on each side are Verbenas Miss Willmott. But perhaps I had better tell you how a few beds are made up. For example, there is a scroll of the Giant Larkspur, blue and scarlet, which, in order to secure prolongation of blooms, is never allowed to seed. One prominent feature is a great border of Carnation, made up of sixteen beds, each containing a single variety."

"Do you give them any protection?"

"We put a pole up, and form a square, in order to protect them from sun and rain. As to treatment, if we see a spot on any of the plants, we give them a little sulphur and lime, which soon has the desired effect. The varieties include J. H. Cutbush, Oakley, Hogarth, The Queen, Duchess of Fife, and Miss Lowther, a white variety which was raised here. I may say with regard to these borders that there is not an inch of ground uncovered at the height of the flowering season. Here is a bed of Chrysanthemum The Speaker, six square yards in extent."

"I observe that in front of your Vine borders you have a herbaceous border. I suppose the Vines do not suffer?"

"Not in the least. As to the herbaceous border itself, which has Roses at the back, it is planted in clumps, with an eye to colour, and embraces all sorts of varieties, old and new, including Anemone Queen Charlotte (white), Isatis glauca (yellow), and Catananche bicolor. We have the entire World's Fair collection of Gladioli, and Gladioli are also used for filling up the clumps of border Carnations, Raby Castle. We clump great quantities of Phlox, in almost every variety of colour; also Anthericums Kelwayii (nine in a clump), Montbretias, and Celsia cretica, using fifty in a clump."

"What is your treatment of Celsias?"

"We sow the seed in February, and they flower the same year, the flower-spikes, which are like Foxgloves, being from three to five feet high. Between the herbaceous plants and the Roses, we have a row of Hollyhocks Campsea Ashe Pink."

A Notable Pergola.

"Speaking of Roses, you have a very handsome pergola?"

"Of which Roses are but one feature. The varieties are Aglaia, Carmine Pillar, Bouquet d'Or, Olga de Wurtemburg, and Kaiserin Augusta Victoria, and Clematis in variety is also used; Ipomœa cœrulea, Vitis Coignetiæ, and the Chilian Nettle give variety. Then, at the break there are Pears, Apples, and Plums. The pergola itself is made with Larch uprights, with a piece laid across, the length being fifty yards, and the width twelve feet. Of course, there are a great number of varieties of other plants in beds or borders, but as there is still a good deal to see, we had better go on to something else."

"What about hardy fruit?"

"Gooseberries are all grown on wire fences. There is not much wall, so that our Peaches are grown on wooden fences seven feet high; they also have the advantage of making a break in the garden. The varieties that do well on fences are Royal George, Gross Mignonne, and Early Rivers Peach, and Violet Hative Nec-

tarine. To secure a good crop of Red and Black Currants, we cut the centres out every year, and there is not a bit of old wood left. You may like to know that, on the top of the north wall, on which Tropæolum speciosum grows luxuriantly, and which has been knocked down to four and a half feet high, we plant in boxes, Carnations, Antirrhinums, and Geraniums."

The Orchard Walk.

Mr. Andrews' own house is surrounded by gardens, one of which contains a number of single beds of Geraniums in variety, while at the back of the house is a bed ten feet long, with a row of Hollyhocks in the centre, other herbaceous plants in blocks, the whole being edged with golden Calceolarias. On the walls behind are Peaches Walburton Admirable under a coping, so that the fruit is gathered as late as October. There are other herbaceous borders, and on the house is the Campsea Ashe Rose, which, when it is in bloom, gives a mass of colour, with a white and yellow centre. Further on is the orchard walk.

"This," explained Mr. Andrews, "was originally an orchard, but it is now used for various purposes. The border, full of Roses growing up Larches twelve feet high, is planted first with bulbs, then with Antirrhinums, and subsequently with Mallows. In this walk we grow for showing and cutting. We never rob the garden itself for showing."

"Judging by the number of cards I have seen, you must have shown enormously."

"There are about 2,500 cards, which were won at the Royal Horticultural Shows, The Temple, Crystal Palace, Colchester, Ipswich, Woodbridge, Yarmouth, Lowestoft, Bury St. Edmunds, and Halesworth, for herbaceous plants, flowers, fruit, and vegetables. Woodbridge is one of the best shows. One of the greatest successes we scored, I think, was in 1906, when we were first in London with Apples."

"Do you grow many varieties of Apples?"

"All the best varieties, and they are grown as standards and bushes. We have Strawberries under the Apple trees, the varieties being Leader, Royal Sovereign, Monarch, and British Queen. Although the orchard walk is chiefly for purposes of utility, we make it as pretty as we can. Here is a Fuchsia fence, with Roses on pillars, and behind the Roses a number of herbaceous varieties. A little further on is a Lavender fence, with Fellenberg Roses behind. Then there is a pergola thirty yards long, with Roses and Clematis mixed. I cut the Clematis down within eighteen inches of the ground, and find that is the best way of making it flourish. On the other side of this pergola are dwarf Hybrid Perpetual Roses, with Ten-week Stocks between them, and, as a rule, Violas. But this year I am using Sanvitalia procumbens, which bears a resemblance to a Sunflower. We have a trial ground, facing south, where we test a good many plants, but there still remain the houses to inspect. By the way, here is a little house which is movable, and set on the top of the pipes."

The Glasshouses.

"Do you go in for many varieties of Tomatoes?"

"Only two—Sutton's A1, and Come-to-Stay, raised by me, eight years ago. Duke of York Potatoes and Carrots are grown on hotbeds. I plant them thickly, take up the first row, and leave the alternate one. In the Melon and Cucumber house we grow Golden Perfection and Hero of Lockinge, and on the stage here I am trying the new Coleus cordata."

"Where are your Vineries?"

"We shall have to cross the long moat to get to them. On the walls of the second Vinery we grow several varieties of scarlet Geraniums, and I suppose there is a large number of the best Malmaison Carnations on the stage. In the three Vineries we grow Muscat of Alexandria, Mrs. Pince, Black Alicante, Madresfield Court and Lady Downe. On the wall of one of the Vineries are Roses Niphetos and Maréchal Niel, which we cut back directly they flower, and obtain a great quantity of bloom."

"Your Peach crops look promising."

"The varieties are Stirling Castle, Barrington, Royal George, and Nectarines Pineapple and Violet Hative. We also have a cool Peach-house, in which other varieties are grown."

"We have not said anything about Pears."

"All the best varieties are grown, and if the old ones are not flourishing, I take off the heads, and graft on another. For instance, I have grafted Doyenné du Comice on Marie Louise, and Pitmaston Duchess on Glou Morceau."

Then, having looked in the Orchid house, which contains Cattleyas, Calanthes, Dendrobiums, Cypripediums, and Vandas, and the greenhouse, where Primulas, Cyclamen, and Francoas were in evidence, I asked Mr. Andrews about the vegetable garden, which I had not time to see.

Sweet Pea Cultivation.

"It covers over two and a half acres of land, which has at different periods been all double-dug. Onions, of which Ailsa Craig and A1 are the two chiefly grown, do exceedingly well. Of garden Peas, Royal Standard, Century, Royal Salute, and Harbinger are mostly grown. A good bed of Strawberries (ten rows) looks very promising. Of early Cauliflowers, the First Crop and Early London are looking well; also Lettuces. In the middle of the vegetables of different varieties are sixty-four rings of Sweet Peas. The rings are four feet across, nine inches deep, and there are fifty varieties, including all the latest kinds. By the side of the kitchen garden, on a border, are thousands of Daffodils, now coming into flower. Just beyond, the main crop of Potatoes are grown, and separating these is a young nursery of ornamental trees and Roses grown for stock purposes. Here are more Daffodils, Canterbury Bells, Wallflowers, etc. Asparagus is grown in beds three feet wide. The rest of the land at present is marked out ready for the crops for the season."

"You might tell me your treatment of Sweet Peas."

"They are sown in January in 'sixty'-size pots, eight to ten seeds in each, raised in a cool house. About the second week in March they are hardened off in a cold frame; by the first week in April they will be ready for the flowering quarters, which are prepared beforehand. The best way to grow Sweet Peas is to prepare rings, four feet across, nine inches in depth, giving a fairly good supply of well-decayed manure, well dug into the land. We planted them about nine inches apart, round the rings, watering them well. During the growing season it is necessary to give them artificial manure once a week, and in the flowering-time they are watered well—about eight to ten pails to a ring. For a late supply of flowers, another sowing is made, about the end of March, in pots placed into a frame. They are then served the same way as the first batch, and these are very useful for placing a ring or two amongst the herbaceous borders. I may say that Mr. Lowther is very fond of his gardens, as the late Mrs. Lowther was, also, and of almost every kind of flower grown in them."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 299.—IRISES.

DEAR KATE,—May is the month of Irises, though these charming flowers are with us in one variety or another for at least eight months in the year. Throughout the winter, nearly till the end of April, we were daily supplied with the long-stemmed Algerian Iris unguiculata (syn. stylosa), which is so valuable in the garden at that time. In February the delicate blossoms of Iris Sindpers appeared in indescribable tints of blue-mauve, spotted with black and gold; also Iris histrio, quickly followed by the Violet-scented blossoms of I. reticulata histrioides. Early in April the tall stems (bearing five flowers one above the other), of Iris Sindjarensis and I. bucharica (which flourish together in the border from year to year) shot up, and the creamy-yellow flowers of the latter are still as I write most conspicuously handsome. The exquisitely-fringed flowers of Iris tectorum (the plant which adorns the roofs in Japan and China) are due about the middle of May, and by that time the masses of rich colour produced by Iris germanica in variety will be in bloom, most desirable in the herbaceous border, with the rest of the barbata group, such as the Florentine Iris (I. florentina), in milky-white; albicans Princess of Wales, in pure white, a very early flower; I. flavescens, in primrose-yellow; I. sambucina, in "high-art" shades of copper, purple, and gold; and I. Cengialti Loppio, which is well worth having, notwithstanding its extraordinary title, for its deep blue flowers are both early and very fragrant.

Dwarf Irises.

The dwarf Bearded Irises from the Crimea bloom about the same time. Many of them are in various tints of yellow, one of the most remarkable of which is that of Orange Queen, whilst Peter Barr, in deep-claret purple, forms a grand contrast, and pumila Count Andrassy is a fine flower in azure-blue, whilst Margaret is in delicate mauve and white, with a large golden crest, and Fieberi is in the richest purple. These dwarf Irises are but little known, yet they should be in every garden. All the barbata group of Irises will flourish even in a city, and they increase and multiply into large clumps if not disturbed for a few years. They are absolutely hardy, and can be relied upon to blossom finely without much attention, so what flowers could be better for the garden?

The Spanish Irises, with their splendid Orchid-like blooms, are rather more often seen, but even these are often conspicuous by their absence from our borders. They should be planted early in the autumn if they are to do well. Bulbs put in during the winter have usually lost much of their vitality, and are likely to become rotten, instead of starting good roots, and if you wish for plenty of the bulbous Irises, you should order them in August, and plant the bulbs directly they reach you, in well-drained, sunny borders, of rather light soil.

Cultural Details.

The barbata Irises are not bulbous, and are not at all difficult to suit in the matter of soil or situation; but those of the reticulata group, with the rest of the Irises which blossom very early, should be planted about eight inches from a south wall, and sheltered in winter by means of a spare frame-light placed over their roots, in a slanting position from the wall behind them, or else in pots in a cool house, for the winter rains and melting snow are not at all desirable for them. They enjoy a light but good soil, with a mulch of old hotbed material in spring; but Iris stylosa needs a poor, gravelly soil, with all the sunshine it can get, for we can never supply it with the sun-

CAN SWALLOWS REASON?

July 12th.—What guides swallows, young birds as well as old, to build their nests on the north and east sides of a house, where, shaded from strong sunshine, the clay is not so liable to crack and break away? It is not easy to regard this as a case of instinct, which has been defined as inherited memory. It must surely be due to some process of reasoning. That animals do reason, though not always more correctly than human beings, is certain. To mention a well-known instance, a pike was placed in a tank of water divided in the middle by a sheet of glass, on the other side of which were minnows. For three months it kept dashing against the glass in the attempt to reach them. It then learned the lesson that the minnows were protected in some mysterious way, and even after the glass partition had been removed, and they were no longer confined to half of the tank, it did not try to molest them, though it darted after and devoured other kinds of fish. Here the possession of a limited power of reasoning is clearly established. And, I think, in choosing the positions for their nests, swallows must also reason. They are the only birds I know that seem to fly purely for the pleasure of flying. It is delightful to watch them. Being insect-feeders, they are classed as useful birds, but I doubt if they help the gardener very much. Their food consists almost entirely of midges, gnats, and other small flies, which they catch on the wing. I have seen them swoop at a butterfly or a moth, but that does not happen often. H. C. DAVIDSON.

MR. ALFRED ANDREWS.

The business of Messrs. Poad and Sons, Potato growers, etc., of York, has been registered as a private limited liability company, with a capital of £100,000 in £1 shares.

At the recent show at Chelsea in aid of St. Dunstan's Hostel for blinded sailors and soldiers, the first prize for a collection of herbaceous plants, occupying a space of thirty by seven feet, was awarded to Messrs. W. Artindale and Son, Sheffield. The premier award for Roses went to Messrs. Alexander Dickson and Sons, Belfast; and the same firm also took the leading honours for Sweet Peas. The trophy for the best exhibit in the show was awarded to Messrs. James Carter and Co., Raynes Park, who made a gorgeous display with greenhouse plants and hardy annuals.

IT is well-known that the Speaker of the House of Commons, the Right Hon. J. W. Lowther—like many a famous man before him—finds relaxation from his arduous duties to the State in the enjoyment of a garden. In town he is a frequent visitor to the principal shows; at his country seat, Campsea Ashe High House, he possesses examples of many styles, from the formal sunk garden to the rosery, rockery, broad herbaceous borders, and water garden. In his head gardener, too, he is well served, for Mr. Alfred Andrews has been in charge for over thirty-three years—ever since the property was bought by the late Hon. James Lowther, father of the present owner—and under his care many of the features of the gardens have been brought to their present excellence, while others are entirely due to him.

Campsea Ashe is a tiny village adjacent to Wickham Market, itself a small country town near Woodbridge, in Suffolk, but once a place of considerable importance. The High House is between two and three hundred years old, and many of the trees and hedges in the grounds are about the same age. These hedges, indeed, are a striking feature of the place.

On the day, early in June, when I travelled down to see Mr. Andrews, the drought still held the land in its power, though there was a distinct promise of its speedy break-up. But in the pleasure grounds little of its effect was to be seen, thanks to the excellent supply of water on the estate. Entering by the gate near to Mr. Andrews' house, and turning sharply to the left, we came at once upon one of the sources of the water supply, a long pond about an acre in extent, with sloping banks, on which are planted Senecios, Spiræas Davidiana and palmata, and other moisture-loving subjects.

"We call these the canals," explained Mr. Andrews. "There is another and longer one parallel with this, behind the tall Yew hedge. Much of this has had to go wild, as we have had no labour to attend to it. We used to keep a staff of eight or nine men, but these, of course, were mostly taken for the army. Among them was one of my sons, who had been of great help to me in the gardens; he, I am sorry to say, was one of those who went under. In place of the men I was fortunate in getting several women gardeners, who did very well; but there were many tasks you could not ask a woman to do, so that much necessary work had to go. That is why some parts round here have not had the required attention. We have not been able to clear the weeds off the water. Two years ago I tried sulphate of copper in a bag, drawn from one end to the other, but though it killed the fish, it did little harm to the weeds."

"What is the total extent of the gardens?"

"Including the woods and water, there are nineteen acres, and we also have an orchard, and a three-acre kitchen garden a quarter of a mile away."

Passing beyond the canal, we approached the west front of the house, on which are climbing plants of many sorts. Clematis montana grows rampantly; while more uncommon is C. connata, which, however, comes into flower earlier than in most places, and at a time when the family are not there to appreciate it. Climbing Roses beautify the walls in summer. Cotoneasters give bright berries in autumn and winter; and many other fine plants help in their season.

CAMPSEA ASHE HIGH HOUSE, AND THE FORMAL GARDEN.

A FINE CEDAR.

Looking straight ahead from the front of the house, the view is broken by some majestic Cedars—one, in the foreground, is a hundred and three feet high—while across the lawn is a sunk formal garden, with a pond in the centre, to which we made our way.

"This garden," said Mr. Andrews, "I made during the first year I came here. The lead tank in the centre is dated 1577, and some of the figures are very old. The beds are planted this year with mauve and pink—Ivy-leaved Geranium Madame Crousse and dwarf Ageratums. I change the scheme every year, to avoid sameness. One year I had white Lilies and Spiræa Queen Alexandra, which made a nice combination."

"There are some very fine Yews here," I remarked, as we walked on, and next came to the bowling green.

"The Yews are about two hundred and fifty years old; and altogether there is about six weeks' trimming every year. I have been told that when the Yews round this bowling green—which is also very old—were first planted, they represented all the letters of the Greek alphabet, but they have long since outgrown their original limits, and the shape cannot now be recognised."

"And here you have fine banks of Roses," I

A CORNER OF ONE OF THE LAWNS.

said, as we came to the next enclosure, and I noticed the sloping sides were covered with climbers, pegged down.

"Yes," was the reply; "this used to be the Rosery, but owing to the tall trees around, and the thick hedges, the plants did not get on at all well, so I grassed down the beds, and put in climbing Roses on pillars and arches, and these seem to thrive. The varieties pegged down on the bank are Fellenberg and Dorothy Perkins, and behind them is Safrano.

A SHELTERED ROCK GARDEN.

Turning to the right, beyond the bank of Roses, we passed under a little rustic arch, and over a broken path, to a charming sunk rock garden, made by Mr. Andrews five years ago. Shut in on the north and east by tall trees, and on the other two sides sheltered by Bamboos and high banks, it is as secluded and delightful a spot as one could wish for. And this seclusion does not prevent its being gay with flowers, though these were later in blooming than in more open situations. Here, in June, were Saxifrages and other plants which elsewhere were long past their best. In the centre is a small mound with a miniature pond, approached by steps. At the top are a couple of Yuccas, their bold foliage imparting a note of distinctiveness; while a nice bush of Olearia Haastii, which stands the winter unprotected, is full of bloom, whose whiteness makes an effective contrast with a clump of crimson Heuchera in the direct line of sight. Peeping out between the rockwork—it is Kentish rag—are many Sedums, Sempervivums, and Saxifrages, and nearer to the water are masses of bright-hued Primulas. The Primulas are a strong feature altogether, and on the outer slopes they are seen in broad patches of many colours. They are, mainly, hybrids raised from seed supplied by Thompson and Morgan, of Ipswich, together with a number of P. japonica. Long belts of rich violet are furnished by Viola gracilis; in another place a liberal planting of Erysimum Perofskianum gives a touch of orange-yellow; brightness is provided elsewhere by Potentilla Veitchii; and behind there will be seen a clump of Cytisus in pale yellow. This by no means exhausts the list of flowering plants, which is indeed fully comprehensive; while handsome Ferns supply greenery, and wherever the situation admits, Arundo Donax lends an additional embellishment.

A winding path through the trees brought us back to a sunk lawn just beyond the house. The five beds here were, in pre-war days, filled with Paul Crampel Geraniums; these gave way to Scarlet Runners, but this year their place is taken by Antirrhinums in blocks of colour.

TREES ON THE LAWN.

Crossing this lawn we get to the north side of the house—the principal entrance—and look along an avenue of stately Limes leading up to a paved court, with tubs of Hydrangeas on each side. We did not linger here, however, but passing again along the west side, note as we go some of the grand old trees. A wonderful Copper Beech, seventy feet high, has a girth of sixteen feet; a giant Cedar, at six feet, measures twenty-one and a half feet round; and many others are but little less.

"These trees," said Mr. Andrews, "were treated wrongly many years ago. Instead of being allowed to grow naturally, with the branches hanging down to the ground, the idea was to make them stand out horizontally, and leave a clear space under them. To do this they were hooped up with iron. This had the desired effect, but provision was not made for their normal increase in girth, and in consequence the iron has constricted many of the branches, which are weakened, and are gradually cut through, so that they eventually break away."

At the back of this lawn, for a distance of seventy yards, is a hedge of Bamboos, at least two yards through, concerning which I was told:

"These have all developed from six little pieces I brought with me thirty-three years ago. Now they run into thousands. We never have to buy canes for staking; in fact, when they are cut down each year there are more than we know what to do with."

GORGEOUS GERANIUMS.

Through a gap in this hedge we came into what is known as the old kitchen garden, now devoted entirely to herbaceous and other plants, and fruit trees. Before looking at these, however, we turned into the houses, entering first into a Vinery, seventy years old. The Vines looked promising; but what most attracted my attention was a glorious display of Geraniums, trained on the back wall. There are eleven plants. Each is twelve feet high, and a mass of glowing rose, crimson, and scarlet from top to bottom. The varieties are Lord Kitchener, Captivation, and Lemoine, all carrying immense trusses on stout stems, in some cases a foot long.

"How long have they been in bloom?" I asked.

"Over two months; and they will keep on for some time yet. They give us plenty of flowers for cutting."

"They are apparently each in a small bed?"

"Yes; the beds are only two feet by one foot for each plant. If they were not restricted they would spread too much. Of course, I feed them well, and when they have done blooming I cut them in. There are flues running under the border, and that helps them considerably."

The Vines in this house are Alicante, Mrs. Pince, and Muscat of Alexandria; in the early house, Black Hamburgh and more Muscats, all with the roots on an outside border. On the back of the early Vinery are Brown Turkey and Brunswick Figs.

From the Vinery we went into the Peach range. The early house has Peaches Peregrine, Dymond, and Royal George, and Nectarines Pitmaston Orange and Pineapple—all young trees; in the late house the varieties are Royal George and Dymond.

POINTS IN PEACH CULTURE.

Asked as to his methods of culture, Mr. Andrews said: "I do not trouble to use a rabbit's tail for fertilising, but just shake the wires. This, I find, disperses the pollen sufficiently to ensure a good set. After the fruit is set I give a good mulch; and during the autumn and winter I give the trees a frequent soaking. Many growers fail with Peaches because they neglect them after the fruit is gathered, and in consequence the trees do not carry a full crop the next season."

"Were you able to keep all your plants during the war?" I asked, as, leaving these houses, we made our way towards the stove.

"No," was the answer; "both labour and fuel were too scarce, but I managed to save a little of each for stock, so that nothing was really lost, and I shall be able to work them up again. Last winter, when fuel was practically unobtainable, we had to fall back on wood, of which there was plenty, as we have so many trees on the estate."

THE FERRY ACROSS THE UPPER CANAL.

"Have you a good collection of Orchids?"

"We had; but they have been reduced in number. Calanthes Veitchii and oculata in this house have been very good. The Crinums have flowered well, and are now going to be moved to a cooler house to ripen off. Other plants in this house are Clerodendrons, Acalthas, and Pandanus. In the next house we have had a nice show of Amaryllis, which is a favourite flower with the Speaker. They are in all colours, some being very rich and fine. Ferns and Coleus are other plants that do well."

In the third house I noticed a batch of Celosias in bright colours; together with a nice collection of Regal Pelargoniums—a flower of which Mrs. Lowther is very fond. Among the best varieties are Duke of Fife, Mrs. Roberts, Robin, and J. Davis. Very striking, too, was a luxuriant Bougainvillea Sanderiana, covering

one side of the house, and carrying an immense number of flowers.

Thence we proceeded to another house, devoted chiefly to Orchids. Here are some nice Miltonias—another of the Speaker's favourites; a good lot of Cypripediums, grown largely for cutting; Cattleyas flowering well, and Harrisonianum, densiflorum, and Dalhousieanum especially noticeable; Dendrobiums; and Cœlogynes, just pulled to pieces and repotted.

There were other houses to be seen, but as they were some distance away we started to explore the old kitchen garden, where, as I have mentioned, no vegetables are now grown.

"Are the fruit prospects favourable this season?" I enquired.

"We have a good set of Pears, and an even better one of Apples," was the answer. "Among the best of the Apples are Lane's Prince Albert, Norfolk Beaufin, Gascoyne's Scarlet, Stradbroke, Peasgood's Nonsuch, Newton Wonder, Jubilee, Charles Ross, Cox's Pomona, Warner's King, Cox's Orange Pippin, American Mother (a very fine fruit), and Worcester Pearmain. On the east wall there are Pears, such as Doyenne du Comice, Beurré Bosc, Marie Louise, Williams' Bon Chrêtien, Beurré Hardy, Pitmaston Duchess, and Conference. On the south and west walls there are Plums, Peaches, and Apricots.

A REMEDY FOR AMERICAN GOOSEBERRY MILDEW.

A long bed of Strawberries, promising well, is made up of several varieties, including Royal Sovereign, Leader, Monarch, British Queen, Waterloo, and Laxton's Latest. Large plantations of Gooseberries in bush and trained form were looking healthy, and led to our talking of American Gooseberry mildew.

"One of the causes of this," said Mr. Andrews, "I believe to be poverty of soil. I had a touch of it two years ago, but I fed the plants well, giving them plenty of good 'muck,' and dressed them with Cooper's V2 Fluid. They soon got well, and I have not seen a trace of the disease since. In other gardens in this district there is a lot of trouble, and I have noticed that it is worst where the soil is poorest."

Turning our attention next to the beds and borders, I asked on what principle they were planted.

A BLUE BORDER.

"The aim is to get broad blocks of colour. For example, the back of the border facing us is to be all blue, to continue the various shades of mauve in the border leading up to it. At the back I am using Salvia farinacea, a lovely blue, and in front a double edging of Heliotrope Madame de Bussey and Mrs. J. W. Lowther. Then, in another long border, we have clumps of blue flowers, the plants I am using being Salvia patens, the Cape Forget-me-not, Lobelia syphilitica, Phlox Mikado, Delphinium Mrs. Thompson (a gentian blue, and one of the richest and best), Sweet Pea Lord Nelson, and Nemophila insignis. These give flowers over a long period, and being of diverse heights, and differing so much in habit, there is no danger of monotony of line."

"You mentioned Heliotrope Mrs. J. W. Lowther. Is that one that was raised here?"

"Yes; it is one of my own raising, and I obtained an Award of Merit for it some years ago. Some of the plants carry trusses twelve inches long and nine inches through. Another plant I raised was Chrysanthemum maximum The Speaker, of which I will show you a large bed. There is a Pentstemon, raised here, Campsea Ashe Seedling, which I am using in front of this bed of Salvia splendens; and there are rows of Michaelmas Daisies selected from our own seedlings."

The other borders are planted with all the best perennials and annuals, always with a definite colour scheme. One strong clump Mr. Andrews pointed out, saying:

"That is a little Chrysanthemum that I think is hardly found elsewhere, though it deserves to be well-known. It makes a neat bush, which in autumn is covered with a dense mass of lilac-pink flowers. The name is Walpole."

Another feature in this part of the gardens is a handsome rustic pergola, covered with Clematis of sorts, Vitis Henryi, Polygonum Baldschuanicum, and climbing Roses like American Pillar, Mrs. F. W. Flight, Trier, and Carmine Pillar. Mention must also be made of a fine specimen of Akebia quinata, which, trained against a warm chimney, has stood unprotected for several years.

A WONDERFUL YEW HEDGE.

Leaving this part of the gardens, we next made our way towards the "big canal," as the larger of the two ponds is called. This is a splendid piece of water, on which floated numerous Water Lilies, with Irises and other aquatics on the sides.

"The Nymphæas are some of the best in cultivation, such as Exquisite, Robinson, Eclipse, purpurata, rosea, and odoratissimum, and no finer sight can be seen than these when they are in bloom. We have as many as three hundred out at once. Some years ago we planted a little Aponogeton, but it soon became a rampant weed, and we had a lot of trouble in getting rid of it."

"The Yew fence that runs the full length of the canal is magnificent!"

"Yes; it is really a wonderful hedge. It is three hundred and fifty yards long, and twenty feet high. There is no suggestion of flatness about it except on the top, as the prominences and bays serve to break up the straight lines. Along the banks we stand tubs, filled with Geraniums, Hydrangeas, and Heliotropes."

Halfway along the bank is a ferry, and near by a break in the hedge gives entrance to the new herbaceous borders cut out of the old orchard. In this is a long pergola covered with Clematis, under which is a border containing two thousand plants of the purple Verbena venosa. Here, as in the other parts of the garden, all plants are grouped for colour.

"Do you grow many Chrysanthemums?" I asked, noticing a number standing near the Tomato house we were about to enter.

"There are now about four hundred of different classes. We used to have many more."

"The Tomatoes are ripening nicely What is this variety?"

TOMATO COME-TO-STAY.

"That is Earliest of All. In another house there are Sunrise and Holmes' Supreme, also a seedling of my own raising called Come-to-Stay. This is a good, even a heavy cropper, and the fruits, which are a bright red colour, often weigh three-quarters of a pound each."

The next house was occupied with Cucumbers and Melon Hero of Lockinge, with a small stock of Begonia Gloire de Lorraine. Outside, between this house and the next, on a north border, I came upon a number of plants of the yellow Carnation Cecilia, placed in this position to keep them back; then, after looking through another house filled with Tomatoes, with Solanum Wendlandi and Bignonia grandiflora on the back wall, we passed to a house of Carnations. Malmaison Prince of Wales was in full bloom; and among the Perpetual-flowering varieties were Mary Allwood, Countess of Wilton, May Day, Matchless, Britannia, Mikado, and Snowstorm.

It was in the next house, formerly used for Cucumbers, that I was introduced to Tomato Come-to-Stay, and the appearance of the plants and the size of the trusses justified Mr. Andrews in his praises. Here, too, was a box of Heliotrope cuttings, concerning which he remarked:

"These have just been put in; and it is a curious fact that they take longer to strike in June than in May. If they had been put in last month they would have rooted in fortnight; now it will take at least ten days longer."

Time did not permit of my visiting the kitchen gardens; but before leaving I asked Mr. Andrews to tell me the number of prizes he has won—for in pre-war days he exhibited largely.

"All told, they come to three thousand two hundred, and include about forty pieces of plate and medals," was the astonishing reply.

W. J. CHITTENDEN.

A FLORIFEROUS RAMBLER ROSE.

CLIMBING ROSES.

These Roses, which are now so great a feature in every garden, will soon be in their full beauty, and everything possible should be done to enhance their charm and usefulness for another year. The new growths rising from the base of the trees should be carefully preserved by being tied up, for on them next year's display largely depends. If more shoots are rising than there is room for, it is a good plan

THE GARDENS AT OVER ROSS HOUSE, ROSS-ON-WYE.

Interview with Mr. G. Andrews.

BY the courtesy of Colonel Thomas, I had the opportunity a few weeks ago of inspecting his charming gardens. Ross-on-Wye is in the centre of the most characteristic of Herefordshire scenery, and Over Ross House, as its name denotes, commands a splendid view over the picturesque town and neighbourhood. It is a climb up the hill on the other side of Ross on which the house and grounds are situated, but the distance was easily accomplished by means of a carriage from the station. Approached by a short drive from the main road, adorned with several fine specimens of Beech, Chestnuts, and Limes, the impression immediately created by the pleasure grounds is that they are in perfect harmony with the house. There is a quiet beauty, a sense of restfulness, about the whole place, which renders it singularly attractive. At the outset, Mr. Andrews, the head gardener, told me that both Colonel and Mrs. Thomas take the keenest interest in the gardens, and throughout there is evidence of personal care and attention down to the smallest details. The object-lesson to be learnt from a visit to them is that, under quite ordinary conditions, a country garden of modest size and unpretending character may be so arranged and cultivated as to bear comparison with one of large dimensions and special features.

The spring bedding was still flourishing at the end of May, and very pretty were the effects as seen from the terrace, the combinations of colour being excellent, while the undulations of the lawn add to the attractiveness of its appearance.

Flower Bed Combinations.

"The four little beds which form a square," said Mr. Andrews, "are made up of double Daisies and yellow Crocuses. They will be filled in summer, two with fibrous Begonias, and two with a strip of Geranium Mrs Pollock running through the centre, and blue Lobelias at the sides, and Dracænas in the middle."

"Then there is a bed shaped like three legs, with Myosotis and scarlet Tulips?"

"The shape is supposed to resemble the emblem of the Isle of Man. In summer there will be tuberous Begonias as a carpet, with a centre of Castor-oil plants, each leg having a centre of Marguerites, and an edging of little silver-leaved Geraniums."

"You have a nice show of Polyanthus in the bed which resembles a crown, with Tulips at the back."

"The Polyanthus are seedlings. I grow them one year, and throw them away the next. They will be followed by Geraniums, with blue Lobelias in front, and an edging of Echeverias."

"And the Maltese cross, now made up of Wallflowers, Blood-red and Cloth of Gold, with Clematis in the centre?"

"Those beds I shall fill with dwarf Antirrhinums, two white and two scarlet. The raised bed with the Periwinkle round it will consist of Salpiglossis, with Grevilleas in the centre. Salpiglossis does well here if we get plenty of rain."

"How will you make up the beds of Hyacinths, Arabis, and Myosotis?"

"In the centre bed there will be Cannas, with Dracænas, and an edging of dwarf Nasturtiums. The other beds will be filled in with Calceolarias at the back, and blue Lobelias in front. The round bed, now devoted to Pansies, will contain Zinnias, with an edging of Pyrethrum Golden Feather."

"There remains the border round the sides of the lawn, with patches of Wallflowers, and an edging of Crocus?"

"These will be succeeded by Geraniums, with an edging of Tagetes. I may add that in the basket bed, with Everlasting Peas and Vincas round it—blue and white—there will be red flowers."

Boxes on the Steps.

Having noticed three splendid Cedars on the lawn, a fine old Acacia, and several Golden

MR. ANDREWS.

Yews, we returned to the house, on which the principal creeper is Magnolia grandiflora. On the steps was a large box of Violas, and I asked how long they remain in flower.

"About two months. The flowers get smaller after that," replied Mr. Andrews. "They are all grown from seed. When they are over, I shall fill the box with Gazania uniflora, and a row of Geraniums at the back."

"I see that you decorate the rooms with Schizanthus and Ferns?"

"We are just coming to the end of the Schizanthus. They are very useful, and do not require much heat in the winter. In the conservatory adjoining the house are more Schizanthus, and a number of Cineraria stellata."

"The Cinerarias look flourishing, and you have a fine Crinum in flower. But how do you get such a display of Nasturtiums now?"

"We go in for flowering them in winter. They are propagated by cuttings taken in the spring, and put in pots. The blooming season lasts for quite three months, and the only attention they require is a little feeding."

"How many varieties of Zonal Pelargoniums are represented in the conservatory?"

"About half a dozen: Princess of Wales, Dryden, Charles Dickens, Pelton, Mrs. Brown Potter, and Princess Alice. Spiræas are grown in pots, and also Mignonette. The Niphetos Rose on the roof has been in flower since Christmas. The big Geranium in a tub is Double Pink. It yields a mass of flower towards the autumn, and we keep it out of doors until the frost comes."

A Striking Herbaceous Border.

Beyond the conservatory is a long herbaceous border on one side of the gravel path, which is intersected with arches; while on the other side, forming practically a continuation of the lawn, is a Rosery.

"How many arches are there?" I enquired.

"Seven. The Crimson Rambler Roses are mixed with Clematis and Lonicera. The herbaceous border, which is edged with Stachys lanata (or Lamb's Ear), contains in particular Pæonies, Iris, Alyssum, Geums, Larkspurs, red Valerianas, Astilbes, Doronicums, double Aquilegias, Calendulas, Veronicas, and Sweet Rockets, with a few Crown Imperials in the spring. Earlier we had a great show of Daffodils and Crocuses, which lasted in flower for nearly a month. The background for flowering shrubs includes Weigelas, Lilacs, Berberis, Laurustinus, Golden and Silver Hollies."

"Do you mix your varieties in the centre circular bed of the Rosery?"

"Yes; but the principal are Captain Hayward, Mrs. John Laing, La France, Marquis of Devonshire, and Margaret Dickson. Moss Roses are grown in the side beds. One of the pergolas is decorated with Golden Hops and Loniceras, and the other frame with Lonicera and Clematis. Then, there are mixed beds of standard Roses, including Duke of Edinburgh, Bessie Brown, and Mrs. W. J. Grant. The raised bed just outside the Rosery, now filled with Myosotis and Daffodils, with Aubrietias at the sides, will contain in summer mixed Stocks, with Dracænas in the centre."

Flowers All the Year Round.

Having noted a pretty summer-house under a lofty Fir tree, with Yuccas growing close by, we proceeded to the back of the house, where there is another flower garden. Here my attention was at once attracted by a large bed of Lilies, with golden Poppies on the bank beyond. I asked the aspect.

"North," rejoined Mr. Andrews. "We have an earlier bed of Lilies further on, but these have been in flower for a week."

"You appear to grow the ordinary garden Fern as specimen plants?"

"We do; and they thrive remarkably. They die down in winter, and we do nothing more to them except cut off the dead leaves."

"I assume, from what I have already seen, that this is an all-the-year-round garden?"

"We certainly try to make it so, and so long

Digitized by Google Original from CORNELL UNIVERSITY

as there are flowers about outside, we use some of them for decorating the house. On the wall here are Forsythia suspensa, Roses, and white Jasminum, and we use a good number of annuals in the herbaceous border. The Lilies are earlier when they get plenty of sun, but they require no treatment. The Poppies seed themselves."

OVER ROSS HOUSE, ROSS-ON-WYE.

The Best Rockery Plants.

"The Geraniums in pots," continued Mr. Andrews, "are subsequently used for bedding, and the two chief varieties are Harry Hieover and Lady Grosvenor. We also use a quantity of silver-leaved Geraniums."

"What plants are principally represented in your rockery, with the Roses at the back?"

"Sedums, Cistus, Arenarias, and Hemerocallis. The rockery is only on a small scale, but the soil suits the plants we grow in it. As the houses are adjacent, we might take them next."

"You have some Malmaisons and Carnations in the greenhouse?"

"Just a few, including Lord Rosebery, Maggie Hodgson, Nell Gwynne, and Astarte. We use the greenhouse for various purposes, most of the flowers here being grown to use in the conservatory. The Agapanthus are put out in pots, and the Lilium speciosum is a favourite flower. We retard a few Schizanthus to keep up the season as long as possible."

Tomatoes and Grapes.

"Do you fruit the Tomatoes here?"

"Yes, and grow them throughout in pots. The variety is Winter Beauty. We have another variety outside, Princess of Wales, which fruits at the end of September. In the Vinery we have Black Hamburgh and Muscat of Alexandria Grapes. The foliage is remarkably strong, and we usually get good crops. The third house is a Fernery, with Roses (Marechal Niel) and Tasconia on the roof. The latter is in flower for months, but we do not cut it."

"Some of your Ferns look remarkably healthy."

"Pteris Ferns do exceedingly well here. We feed them heavily, but the house is specially adapted for them. Maidenhair Ferns are grown largely for table use, and we have a few Azaleas. The one in flower is Empress of India."

At the entrance to the considerable kitchen garden are more flowers in borders, conspicuous amongst these being Silenes.

"I sow the seed in spring for autumn flowering, and in autumn for spring flowering," said Mr. Andrews, "putting the plants out in the autumn. They stay out in the winter, and flower in the spring. One of the features here is a row of Everlasting Peas, which begin to flower in August, and keep on till the frost comes; and another, the Pæonies."

"Pæonies seem to find the soil congenial?"

"Yes, it is sandy, with red clay subsoil. We simply let them stay in the borders, and they flower profusely. The worst of the soil is that we want rain every week in summer, but the Pæonies are over before the dry season sets in. Behind this border we have our ordinary Sweet Peas. They are all grown from packets of mixed seed, and we get a quantity of blooms."

THE BEDDING ON THE LAWN, OVER ROSS HOUSE.

"How long have the Shirley Poppies, which are just flowering, been in the ground?"

"Two years. They are now self-seeded, but in the first place we sow the seed. The remainder of the space outside the kitchen garden, you observe, is devoted to fruit trees, chiefly Apples, all grown on bushes."

"When were they planted?"

"About six years ago, though they are of different ages and sizes. The varieties are Bramley's Seedling, Ecklinville Seedling, Bismarck, Annie Elizabeth, Cox's Orange Pippin, Ribston Pippin, Lane's Prince Albert, Blenheim Orange, Sturmer Pippin, Peasgood's Nonsuch, and Warner's King. Sweet Cherries are grown on the wall, May Duke, Bigarreau, and Governor Wood. I attribute the good crops to the fact that we mulch them well and keep them moist."

"How large is the kitchen garden within the walls?"

"An acre. Here, too, we have a good show of flowers, both in the centre and on either side. Pyrethrums are quite a speciality. They are the singles, and we use them freely for table decoration. In the borders are also single and double Aquilegias, Cerastiums, Arabis, and Silenes being used in front, and making a good contrast of red and white."

A Cheap Flower to Grow.

"Mention ought to be made of your very prominent display of Polyanthus all round the garden."

"They have done particularly well this year, but they always flower profusely, and, moreover, they last for years. Anyone who wants cheap flowers and plenty of them, should buy Polyanthus seed, and they will get a good show the spring after they are sown."

"What are the varieties of Violets you grow under a high wall?"

"Princess of Wales, Marie Louise, and Lady Hume Campbell. I am flowering for the first time Anemone nemorosa Robinsoniana, and it is very nice for cutting. Then we have a quantity of Irises, which I part when the roots get on the top of the ground. Most of the herbaceous plants soon grow big, and I always part them then."

Japanese and Bush Chrysanthemums.

"Your Chrysanthemums appear to be coming on well."

"I grow some of the Japanese large-flowering and some of the bush, only. The best of the former are Nellie Pockett, Mrs. F. S. Vallis, Miss Mildred Ware, Mrs. E. Thirkell, Lady Henderson, Mrs. G. Mileham; the bush include Ladysmith and Dorothy (singles), Source d'Or and Nellie Pockett (double)."

"When do you put your Begonias out?"

"The beginning of June. The soil suits both fibrous and single tuberous, but we have to use

Digitized by Google Original from CORNELL UNIVERSITY

a great deal of water. The sun does not hurt the flowers if they are kept moist at the roots."

"The Pears and Plums on the walls appear to be well set."

"The Pears are mainly Beurre Diel, Pitmaston Duchess, Uvedale's St. Germain, Catallac, Beurre d'Amanlis, Easter Beurre, Souvenir du Congres, Conseiller de la Cour, Marie Louise, and Marie Benoist; the Plums, Oullin's Gage, Cox's Golden Drop, Monarch, Heron, Belle de Louvaine, Archduke, and Transparent Gage. Brown Turkey Figs do well on the wall, though last year they were the only fruit crop that failed."

"How do you get your Apricots to look so well?"

"Perhaps the fact that we mulch them with a quantity of grass, mown from the lawn, may have something to do with it. The varieties are Moor Park and Hemskirk. The Peaches on the walls are Hale's Early, Sea Eagle, and Royal George. On the north wall are Morello Cherries and also a number of Red Currants, which are grown here in order to have a late crop. Red and White Currants are grown in quantity on bushes, likewise Gooseberries. The latter are also grown with the Raspberries in the large wire cage."

THE HERBACEOUS BORDERS AT OVER ROSS HOUSE.

"Do you keep your Strawberry plants for nine years?"

"Some of them are four or five years old, and are bearing well. The varieties are Royal Sovereign, Elton Pine, and Latest of All. Pears, Apples, and Damsons are also grown as standards."

The Vegetable Collection.

"What about vegetables?"

"We go in strongly for Peas, and shall soon pick Empress of India and Sutton's Harbinger. These are followed by Eureka, Ne Plus Ultra, and Sutton's Bountiful. In cultivating Peas, I dig out a small trench. We force a few Potatoes, Duke of York, in a cold frame, and grow Sutton's Satisfaction, Ringleader, and Up-to-Date. Asparagus is picked at the end of April, and we go on till the middle of June. The Broad Beans are Sutton's Long Pods; we generally get them early in July. Other vegetables are Onions, Glow, Long Keeping, and Giant Rocca; Parsnips, the Student; Carrots, Intermediate and Early Gem; Globe Artichokes, and Sutton's Longpod French Beans. We also grow Beet and Salsify, and Lettuces most of the year, though we do not force any. In order to obtain Seakale early, we cover up with pots of manure, and if we want to get Rhubarb early, we protect a few plants by covering them."

"How long have you been here, Mr. Andrews?"

"Three years. This is my first appointment as head gardener, and my previous experience was chiefly gained in the gardens at Compton Bassett, Wiltshire."

ALFRED WILCOX.

NEXT week we shall deal with the evolution of the garden at Berechurch Hall, Essex—an interview with Mr. George Peach.

Hints to Exhibitors.

ON GROUPS OF FLOWERS.

THE classes devoted to groups of hardy flowers leave much to the discretion of the exhibitor, and afford a wide scope for individual taste and judgment. Beyond stipulating whether the subjects are to be annuals, biennials, or perennials, and the number of bunches and separate flowers in each, the schedules usually impose no restrictions. With so large a field from which to select, these classes should be amongst the most attractive in the show, and yet too often they provide but a sorry spectacle. The same type of flower is repeated by each exhibitor, and few attempt to get beyond the beaten track; while, probably because of the ease with which they can be raised and grown, little trouble is devoted to the production of really fine specimens.

Pitfalls to Avoid.

Before considering the points necessary to gain the much-desired "first," it may be well to remind intending exhibitors of a few things they must avoid. A pitfall to many is the distinction between annuals and perennials. Some plants are represented by both forms, and care must be taken that the right kind is chosen. Annuals run their life-cycle within a period of twelve months, *i.e.*, they commence their growth, mature, ripen seed, and die within a year, the only exceptions being those hardy plants which can be sown in autumn, and are capable of surviving the winter. Those which may be perpetuated by cuttings, and thus be saved through the winter, are not eligible. Biennials require two years in which to complete their development.

Perennials, though they may be induced to flower and bear seed the same year as sown, are plants which have a longer period of life, coming up year after year. As a general rule, when perennials are asked for, those classed as "herbaceous" are intended. This term implies that the stems die down at the end of the season, but that new growths arise the following year from the same rootstock. Where the stems remain throughout the winter, and only the leaves are shed, the plant is called "deciduous." For this reason, if Roses are included among a group of perennials, they are liable to be disqualified, as they come under the last-mentioned definition. It may be generally taken for granted that plants which may be exhibited in special classes are not eligible for any others, except such as table decorations and bouquets.

How Points are Allotted.

The lines upon which judges work differ very little, and are in the main based upon the rules laid down by the Royal Horticultural Society. Points are allotted in varying proportions for the quality of the blooms, size and elegance, freshness, form and colour, rarity or difficulty of cultivation, arrangement, and naming. Of these points, some are given to the separate bunches; others, such as arrangement and naming, apply to the exhibit as a whole. The importance of care in cultivation, packing, staging, and selection will be at once apparent. Too many exhibitors think that they can include weak and common specimens in their group, and that among the multitude they will not be noticed. Each bunch, however, is first closely scrutinised, and points deducted for bad blooms; and after each has been thus judged, the group is looked at as a whole, and final points awarded. The points apportioned for rarity of the plants or difficultity of cultivation are a direct encouragement to those who are not afraid of originality, nor content to follow in the wake of others.

As the plants themselves differ so widely in habit, it is impossible to give explicit directions for staging them; moreover, in some shows this is not left to the exhibitor, but is managed by a committee, who also provide the receptacles. Each exhibitor should find out the practice at the particular place where he is showing. To have the flowers as fresh as possible, the advice so frequently given may be repeated, not to cut them when the sun is on them, but early in the morning; and also to beware of putting them into very cold water, that with the chill just taken off being far better. SCRUTATOR.

Flower Bedding at Hinchingbrooke.

(See illustration on page 311.)

AT Hinchingbrooke, the Huntingdonshire seat of the Earl of Sandwich, may be seen some fine examples of a style of bedding less popular nowadays than it was a generation ago. Our illustration gives a view of the south-west front. All the space, except that required for the walks, is devoted to the flower beds, which are edged with Box, closely trimmed and well kept. The bed in the immediate front of the picture is filled with Pelargoniums; and the second bed likewise contains the same sort of plant, but with variegated leaves, and also in standard form, which is rarely met with. Other beds to the left also contain Pelargoniums, relieved with taller plants of variegated Maize. The triangular bed to the right is made up with Heliotrope. In the background is the shrubbery, with some fine specimens of Irish Yew. The walks are gravel, covered with broken sea shells, pleasant to look at and walk upon.

Digitized by Google Original from CORNELL UNIVERSITY

one way of acclimatising this beautiful Lily, but it requires patience—patience extending over seven or eight years. If plants were raised from seed and grown outside, they should prove as amenable to cultivation as the ordinary white Lily.

November 4th.—I have had many fine clumps of Pampas Grass, but I do not know that I have ever seen one with more flower-buds than the one shown in the illustration. The soil suits it, and there is plenty of moisture down below, so it grows most luxuriantly. An annual top-dressing of well-rotted manure around the roots is a great help, and as these plants sometimes suffer in very severe winters, the dead leaves should be left as a protection until the spring.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 162.—MR. GEORGE ANNAND, AT THE GARDENS, BASILDON PARK, PANGBOURNE.

WHEN I asked Mr. Annand to show me the gardens at Basildon Park, the beautiful country seat of Mr. Charles Morrison, he warned me that there was no kitchen garden. That is to say, it is found more convenient to let the kitchen garden attached to the park, and comprising about four acres, to a market gardener, who supplies the mansion with such fruit and vegetables as Mr. Annand does not grow. The whole of the head gardener's attention is, therefore, devoted to the lawns, flower garden, and glass, which are on a considerable scale. Arriving from Pangbourne on a pleasant afternoon late in September, at Mr. Annand's pretty lodge, I gladly assented to the suggestion that we should start at once up the picturesque Snail Creep, which forms a winding path, shadowed by splendid old trees, to the lawns. Our first pause was made at the old Rosery, with a summer-house built on the trunk of an old Yew tree, and called The Umbrella, in the centre. There are still some Roses, chiefly Scotch varieties, which do very well, but the system now is to fill the beds with plants of different kinds, according to the respective seasons. At the time of my visit there was a striking display of fine Sedum, and Mr. Annand said,

"The plants have been in bloom since July, and will remain in flower until the frost comes. The variety is Sedum populifolium. Now, as you see, there are also Godetias, Marigolds, and Dahlias. We had, earlier, a rare show of Sweet Peas (Sutton's Giant-flowered). They were raised indoors, four seeds being planted in a 5-in. pot. We put the plants out of doors at the end of April. The flower-stalks were eighteen inches long."

Close to the mansion, which stands on a lofty eminence, and commands extensive views of the Thames and the country, there are two croquet lawns, which were made last year, with turf lifted out from the park, and I congratulated Mr Annand upon their appearance under the circumstances. He rejoined that, in order to keep them in condition, they had to be watered every second day during the hot weather.

"With regard to lawns," he continued, "the lawn at the side of the mansion has taken the place of a clump of great trees. It was made also last October, and occupied us from the middle of that month until a fortnight from Christmas. I suppose that the trees and stuff we carted away amounted to nearly a hundred tons. There are here fine specimens of Quercus Ilex and Quercus pseudosuber. Ivy arches hide the blank wall and the domestic quarters."

"The mansion, I observe, has no creepers on it?"

"No, it is kept bare on purpose. The beds in the flower garden on the terrace are one of our features. There are twenty-nine of different sizes."

"It would be interesting to mention their contents in detail."

BASILDON PARK, PANGBOURNE.

"The four corner beds in panel are made up of bedding Cannas in the centre. There are four big panels, consisting of two of Flower of Spring Geraniums and two of Crystal Palace Gem, and four small ones of Lobelias, Royal Purple, marked out with Pyrethrums and Dactylis Grass, and a permanent edging of dwarf Sedums."

"The round beds are of the star pattern?"

"Yes. In the centre are Cannas in a ring of Golden Tricolour Geraniums. The star is worked out with Sedum populifolium, and the four half-circles with Lobelias Paxtoniana and speciosa, with a permanent edging of Veronica alpina variegata. There are four oblong beds,

MR. GEORGE ANNAND.

two of Indian Yellow Geraniums, and two of Mrs. William Paul Geraniums, edged with Saxifragas; and four, supposed to be carpet-bedding, consisting of Coleus Verschaffeldtii, Mesembryanthemums, dwarf Ageratums, and dwarf Begonias, the patterns being worked out with Pyrethrums and Dactylis Grass. Four other beds are filled with Geraniums Robert Fish and Lobelia speciosa. There are four more round beds, two with Lobelia cardinalis in the centre, with rings of Geranium Flower of Spring, Sedums and Lobelia Paxtoniana, and a permanent edging of the purple Aubrietia, the other two having bronze Geraniums (star pattern) in the centre, with the four half-circles in Lobelia, and two oblong beds with Ivy-leaf Geraniums."

"There are still three more beds, including the two with a pretty combination of colour."

"You mean the golden Tagetes, and Ageratums, edged with Pyrethrums. The other round bed contains Pentstemons, mixed, which have been in flower since the end of June, edged with Veronicas. The Pentstemons stay here all the winter."

"That is to say, you do not lift them?"

"No, we leave the old growth on until the young growth is well up at the roots, and then cut it off."

"The seven urns on the terrace must be very ancient?"

"They came from the Catacombs in Rome, and have been here a great many years. They are all solid marble."

"When were the Irish Yews on the left of the mansion put in?"

"I believe about seventy years ago, when the gardens were made."

"They are quite young compared with the Oaks close by?"

"Those two Oaks are supposed to have been in the original primeval forest, and are called Adam and Eve. The park, which is one of the oldest deer parks in England, contains a vast number of Beech trees, and some big Cedars,

one in particular covering a great stretch of ground."

"The tennis courts are also, I notice, adorned by a fine clump of Spanish Chestnuts."

Then, passing two statues of dogs on the terrace, we went into the conservatory, which is upstairs.

"Just now," said Mr. Annand, "the contents are chiefly Geraniums, Coleus, Fuchsias, and Ferns. In June and July the Pelargoniums were at their best; and in the spring we had Cinerarias, Primulas, and flowering bulbs."

"The appearance of the pale green paint picked out with white is very pleasing; but why do you use wire stages?"

"Because we can get a better effect than with the wood stages. The Hoya carnosa, or Honey-flower, we grow in a pit here instead of planting it out in the border."

"I conclude that you fill the balcony with flowers which were in the beds last year?"

"Yes. They are all Geraniums, four in each 12-in. pot. Some of them are nearly three feet through. On each side of the front door are two stands filled with flowering plants."

As we left the mansion, Mr. Annand pointed out on the right a rootery and a rockery combined. The roots were brought away from the proximity of the mansion, and Saxifragas and Ferns, and other rockery and shade-loving plants have been planted out. In this portion of the grounds a Poplar (straight as a dart), Tyrolese Larches, and a remarkably good specimen of Liriodendron tulipifera, are conspicuous. Lilacs have also been forced, and were planted out in clumps three years ago; last year they were in flower. A large bed has been made in order to break the monotony of grass and trees, and I asked what it contained.

"In the centre are Perillas, Geraniums Tricolour and Crystal Palace Gem, edged with Silver Tricolour Geraniums and Lobelias. We like the contrast in colour between the brown of the Perillas and the foliage of the Geraniums."

As we walked towards the herbaceous border, which is beautifully situated on a slope, sheltered by a magnificent belt of trees, I inquired the extent of the pleasure grounds.

"From twelve to thirteen acres, and you may judge of the extent of the park when I tell you that there are between four and five miles of stone wall round it. Thousands of bulbs of different varieties are planted under the trees. We are well supplied with water. The new tank just built holds 5,000 gallons, which brings our total storage capacity up to 17,000 gallons. An advantage in this garden is that all the paths are asphalte, and can easily be kept clean."

"You have a nice hedge of Lavender?"

"Yes, the Lavender is saved and sent to the hospitals. One border is filled with perennial Phlox, Pæonies, Michaelmas Daisies, Galegas, Dahlias, and annuals of different varieties."

"Hollyhocks seem to have prospered here?"

"They have done remarkably well. The old plants suffered a little from disease, but all the young ones escaped. The Sweet Peas (Eckford's varieties) are a second batch, and they will continue to flower until the frost cuts them down—probably right on through November."

"How many Chrysanthemums are there in pots?"

"About two hundred and forty. They include Japanese and Incurved; a third part are singles, and the rest bush plants."

"Did your Carnations flower well?"

"Wonderfully well. They are the Edenside Carnations. The border varieties are mixed, and consist of Selfs, Flakes, and Bizarres. They are last spring seedlings, were sown in March, and a good percentage came up. I had a lot of flowers off the Marguerite Carnations."

"What is your method of treatment?"

"I take them out of the seedling box, pot them up, and keep them through the winter, and plant them out in May. I had twenty plants, all doubles. The singles I discarded."

"Your Strawberry plants look healthy?"

"We do not force too early. There are two batches of a hundred and twenty, both Royal Sovereign; the first batch are only in 4-in. pots yet."

"What have you got in the frames?"

"In one of the ranges of frames there are bedding plants, and in a second Violets (Marie Louise and Princess of Wales). Bedding-out Geraniums, and Malmaison Carnations of the best varieties, which will have half a dozen or eight spikes next year, are in one of the other ranges. We put Azalea mollis out in the shade. There are about fifty plants, which promise to bloom luxuriantly. Where the frames used to be, a new wall for Peaches has been built. We have a glass top put on, and we shall have a border of early Strawberries at the bottom of the wall."

"Can you tell me the height of the enormous bush of sweet-scented Bay?"

"It is about sixteen feet high, and seven through. The Bay leaves are used for flavouring puddings, etc."

"Do you grow many varieties in the Rose border?"

"Cheshunt Hybrid is one. It does well both on the wall and in the ground. The only other varieties are Mrs. John Laing and W. A. Richardson. On the walls just here we grow a few Tomatoes, Sutton's A1. From the beginning of July until the middle of September, Godetias (double rose) gave us a lot of bloom."

"How many Pelargoniums do you grow?"

"About two hundred. I had a sport this year which is very rare. It came on a plant of the Outlaw, a very dark variety, and the sport was very light. The lower petals were pure white, and the top dark crimson. The flower was nearly as big again as the parent plant. I have never seen one before. I have taken cuttings of it, and it will be interesting to see if it will come true next year."

"Do you grow only Black Hamburghs in this house?" I asked, as we entered the late Vinery.

"That is all. The Vines are three years old. The crop is heavy, if the bunches of Grapes are not very big. Roses Niphetos and Maréchal Niel do well on the back wall; also Swainsonia, both the white and pink varieties. We have about four dozen plants of Smilax. It is grown on black cotton, as I find if grown on raffia, or twine, it shows when laid on the table, unless it is pulled out, and that risks breaking the trail."

"Is there but one variety of Grape in the early Vinery?"

"That is our principle—one Grape, one house—and I think that it is the best. I am going to plant new rods of Muscat of Alexandria in the early Vinery. The stage here is used for bedding-out plants. In the intermediate house we have a Datura, which has a magnificent bloom, and a fine foliage. It is cut right down in January; we have it planted in the border. Other plants here are about a hundred Poinsettias, about fifty Euphorbias, and a quantity of Sutton's hybrid Gesneras."

"When were they sown?"

"In February. The Gloxinias are Sutton's spotted hybrids. I had about a hundred and fifty plants out of a half-crown packet of seed."

We next inspected the early greenhouse, in which are many Pelargoniums, and I said, "Although you have told me the number you grow, you have not named any varieties. Which do you consider the best?"

"Duchess of Portland, Imogen (a special favourite), W. E. Gladstone, Madame Thibaut, Nyanza, Queen of the Belgians, Gloire de France, Jeanne d'Arc, Belle Nancienne, Madame Hoste, and Swanley Gem. These, with Raspail Improved, are the principal."

In a niche in the stove were a few Dendrobiums and Cœlogyne cristata, and Mr. Annand mentioned that there were a hundred and thirty-two blooms on one pan of the latter, and two hundred and twenty-three on another, some of the spikes having as many as ten blooms on them.

"In addition to the Orchids, you have Crotons and Dracænas?"

"The favourite Croton is Laingii. Others are Golden Ring, Prince of Wales, Warrenii, and variegata. The Dracænas include terminalis and alba, Cooperi, Goldiana, and Paqua, a very good table variety, of dwarf habit. There are also in the stove half a dozen Dieffenbachia Bausei. They are not difficult to grow. Then, there are four dozen Gloire de Lorraine Begonias. Outside, in frames, are four dozen each of Primula stellata and P. sinensis, and about fifty Salvias splendens and coccineum, a hundred greenhouse Cinerarias, and a hundred Cineraria stellata."

"Do you grow Primula obconica?" I asked, as we proceeded to another large greenhouse.

"Yes, a quantity. The supposed poison never affects me here, though in Wiltshire I suffered from it, and my brother nearly lost the use of one of his eyes, through rubbing it with his hand after he had been handling the foliage

Crossing over to the Peach house, Mr. Annand told me that the spring bedding included some two thousand Wallflowers, Fairy Queen, Purple Queen, Eastern Queen, and Sutton's Golden Bedder (dwarf), and a large number of Pansies, Myosotis, Arabis, Polyanthus, Tulips, and Hyacinths."

"How long has the Peach house been built?"

"Seven or eight years. We had a hundred fruits off the little tree of Lord Napier Nectarine this year. The Peaches are Gros Mignonne, and Royal George, and we have just finished picking Barrington. I had half a dozen weighing about nine ounces each."

From the greenhouses we made our way to the garden in front of Mr. Annand's cottage, which is very tastefully laid out.

"There are nine beds in all," he said. "One consists of Phlox Drummondii and Chrysanthemum Burridgianum in the centre; two of Pentstemons; a bed of yellow and a bed of blue Violas face each other; there are two round beds of Cannas, Geraniums (Flower of Spring), and blue Lobelia; and two square beds done in panels with Cannas, Geraniums, and Lobelia, marked out with Pyrethrum and Dactylis Grass, and two old clumps of Ferns, which looked well before the dry weather set in. Canary Creeper grows well on the wall of the house, and Clematis montana and Honeysuckle on the porch."

"I believe you have spent a good deal of your gardening career in Scotland?"

"Yes, I am a Scotchman, and served my apprenticeship in the gardens at Sea Park House, Morayshire. I next went to Durris House, Aberdeenshire, for three years, as second in the houses. After that I was general foreman to the Duke of Fife at Duff House; and at the end of a year I proceeded to Crathes Castle, Kincardineshire, as inside foreman. Then I crossed the Border."

"As head gardener?"

"Yes, as head at Salthrop House, near Swindon. I filled that position for four years, and then for seventeen months I was head at Brent Eleigh Hall, Suffolk. Just a year ago I came here."

"Have you done much showing?"

"I have not done any since I was head gardener. There is one difference I notice between

A GROUP OF WHITE FOXGLOVES.

gardening in England and Scotland. They are not so strict in serving an apprenticeship here. In Scotland every beginner is bound for three years, and I think that every head gardener ought to make a point of enforcing that rule before he gives a certificate of efficiency to anyone who has started under him." ALFRED WILCOX.

Letters from a Lady Gardener.

No. 119.—MICHAELMAS DAISIES, LILIES AND FOXGLOVES.

DEAR KATE,—We are very busy getting the garden into order for the winter, for although, as I told you, it is well to leave a few falling leaves on the borders to protect the plants, and help to nourish them, yet there is much to be done if the garden is not to look disastrous.

The Michaelmas Daisies, which have been lovely, must now be cut down (in fact, some of the earlier-flowering varieties were cut off a fortnight ago to prevent them from flooding the garden with their fluffy seeds), and from the stems of these Asters we select a few dozen of the strongest and best, remove their leaves, and the top, and tie them into neat bundles for stakes, as they are invaluable for pot plants (especially Freesias), being so slight and tidy-looking—much better than sticks. The stems of Helianthus are much thicker, but not so strong; they must be cleared away now, with the dead stalks of various annuals and biennials. Then the Cactus Dahlias (which are still bright at the time of writing) should be labelled before they are taken up for the winter (or confusion will reign amongst them next year), and as soon as the frost becomes sharp enough to cut them down, each root should be carefully raised with a fork (not a spade, or the tubers will be cut), and the label tied round the small piece of stem which is left above the roots. They can then be stored in a box in the cellar, covering them with sand or light soil, till the spring arrives, when they are taken into the greenhouse, or placed in a Cucumber frame, to start, and then divided, each into two or three pieces, and planted out. You can, of course, take cuttings from the shoots too, but those which appear first of all do not strike roots well, and it is best to take off the second set of shoots (each with a tiny piece of the tuber attached), and put each in a small pot, which can be sunk in the hotbed until growth begins, then potted on, and brought on in the greenhouse until it is fit to go out into the open.

But to return to the borders. We have a number of plants of the lovely blue Salvia patens, which are still showing a few blossoms; these are treated like the Dahlias, and they, too, spend the winter in a box in the cellar, for they have tuberous roots, and are half-hardy. Cannas, too, are in the same category; but we often pot up singly any late spike of these which is now showing buds, for these will open well in the conservatory, and their bright flowers are valuable towards Christmas. The old plan of drying off Cannas, I am convinced, is a mistake; too much dryness often ends in dry-rot, and they only need to be kept cool and slightly damp through January and part of February to start fresh growth strongly towards the end of that month, when they should be divided, choosing the strongest crowns to pot up separately, and starting them in warmth, with plenty of tepid water as they grow. The Heliotropes, Pelargoniums, and other tender things, of course, have been potted up, and by the time all these things are taken in the borders begin to look rather bare; but, then, there are the biennials to be put in for next spring, as well as plants of blue Delphinium, Pæonies, and other fine perennials.

Let me advise you to put these things in groups, not dot them about singly, or make a row of them; their effect is much finer in this way, and they are more easily attended to; they must have deeply-dug and rich soil, too, so that it is well to prepare the places for them before they arrive, adding a liberal allowance of hotbed stuff from the empty Melon frames.

White Foxgloves (Digitalis) are specially handsome, and the large white ones, spotted inside with crimson (maculata), are the best of all, growing to the height of eight feet and more in my garden. We treat them as biennials, sowing the seed every two years, in May, in the kitchen garden, pricking the seedlings out into a nursery border of good soil in July, and planting them out in October in groups of five or seven plants, each one foot from the next. The later seedlings do not always bloom the next season; but take the next summer to gather great strength, and these produce the finest possible spikes of blossom the second season after planting.

Hollyhocks can be grown exactly in the same way, and should be treated as biennials, for the spikes of bloom produced after the second season are not often fine. They need a great deal of rich soil, and enjoy a thorough supply of liquid manure just as they are beginning to throw

LILIUM AURATUM PLATYPHYLLUM.

up their tall flowering-stems. The disease which is so troublesome to these plants is probably the outcome of the foolish plan of coddling them in heat as seedlings, which has enfeebled their constitutions, so that they easily fall a prey to the fungoid disease. The best remedies are to sow the seed in the open ground in May, and to syringe the seedlings strongly with sulphide of potassium (half an ounce to the gallon of warm water), several times in succession, as they grow, giving them plenty of nourishment and moisture, and covering their roots in winter with a small conical pile of fine ashes, for the germs of this disease object to being deprived of air. It is said, too, that it is a good plan to soak the seed before sowing it in the warm (a hundred and twenty degrees) water and sulphide of potassium wash, or a solution of permanganate of potash, but this we have not yet tried. So far, all the remedies mentioned above are only palliatives, and do not thoroughly finish the disease, which has a nasty trick of reappearing in warm, dry weather.

Liliums, which can be planted now or in the early spring, make very fine groups, especially the Golden Lily of Japan (L. auratum), and its splendid varieties, L. auratum platyphyllum, and rubro-vittatum. But it is almost impossible, in my experience, to obtain bulbs of these Lilies which have not been deprived of their lower roots, for convenience in packing, and no bulb which has been treated in this way is worth putting into a border, for it will probably decay there, or, at the best, bring only a miserable bloom the first season, and then die. The best

THE GARDENS OF SIR EDWARD STERN, AT FAN COURT, CHERTSEY.

Interview with Mr. Geo. Arthur.

ALTHOUGH it was the middle of September when I visited the gardens at Fan Court, the approach of autumn had but slightly affected the beauty of their appearance. Mr. Arthur, the gardener, who met me on my arrival, suggested that we should begin by an inspection of the pleasure grounds, and on reaching the end of the carriage drive, some remarkably fine clumps of Rhododendrons at once claimed my attention.

"When the Rhododendrons are over," said Mr. Arthur, "the Liliums which are planted with them give a long flowering season. They include several varieties."

"Do you have to put peat in the soil for Rhododendrons?"

"Yes, but the natural soil, which is sandy, suits them. Many are choice hybrids, but the named varieties include Frederick Waterer, James Waterer, Lady E. Cathcart, Sappho, Pink Pearl, Princess Christian, J. H. Agnew, Mrs. John Clutton, Mrs. Holford, The Queen, Kate Waterer, Mrs. Stafforth, and Gloriosum."

"You have a number of specimen trees in the shrubberies. What is the aspect here?"

"South. Some of the most notable trees are Wellingtonia gigantea, Pinus Douglasii, and a Cedrus deodara feathered to the ground. On the rising ground above the gardens, ponticum Rhododendrons and Heather make a bright show earlier in the year. The bed of big shrubs near the winter garden contains chiefly Hollies, Berberis Darwinii, Laburnums, Buddleia globosa, Olearia Gunnii, Arbutus, and Ruscus. In the wood above the lawn there are two large Palms, Chamærops Fortunei, planted out. We have had twenty-five degrees of frost here, and it has not touched them. Near these Palms is a large bed of woodland Azaleas; and a quantity of Azalea mollis are planted in groups in the wood. On the heights of the wood there are fine views, and the Crystal Palace, Staines, and Sunbury, as well as the new motor track at Weybridge, may be seen."

The Winter Garden.

"I see that Plumbago capensis is still in flower in the winter garden."

"Yes, like Streptosolen, Abutilon Thompsonii, Bougainvillea glabra, and Lapageria rosea, it does well planted out in the winter garden. Here, also, are Camellias, white and red, which flower profusely. Ferns and Palms are used for decoration."

"What is the age of the grand piece of Dicksonia antarctica?"

"It has been in its present quarters for nearly thirty years The only thing I do to it is to feed it freely. Among Nephrolepis Ferns, todæoides and exaltata, which are each represented by two thriving specimens, are favourites. Of course, the rest of the contents of the house changes with the changing seasons. We make a great show of Chrysanthemums."

"Of which I shall ask you to tell me more presently."

Then passing under a pretty pergola, composed of Vitis in variety, and Wistaria sinensis, and noting some fine Cannas in tubs on the steps, we paused at the beds.

"Three of these," said Mr. Arthur, "consist of Heliotropes edged with Mesembryanthemums, and two of Salvia Glory of Stuttgart, edged with Echeverias, with a groundwork of Violas Imperial Blue, Maggie Mott, and William Keel. The standard Roses flower well.

MR. G. ARTHUR.

Near the Roses is a Tulip tree, generally said to be almost the finest in England."

A Contrast in Colours.

"You have a pretty contrast in colours in the long borders on the east front of the Court, made up of Begonias and Kœniga."

"The Begonias, of which there are four rows, are Crimson Gem, Crimson Bedder, Pink Queen, and Miniature White. The edging of Kœniga maritima sets them off very well."

"How are the beds composed on the north front of the mansion?"

"There is one round bed on the terrace with Canna Black Prince and Veronica Andersonii, edged with Ivy. Then, there is a bed dotted with Kochia trichophylla, and a groundwork of Viola Mauve Queen, edged by Geranium Lady Plymouth."

"How long do the Hydrangeas paniculata—which now yield huge masses of flower in two beds—remain in bloom?"

"Into October, and then the foliage continues. The groundwork of these beds is Gazania splendens, edged with Veronica aurea. In the well of the terrace is Cotoneaster trained as a table under the wall."

Kochias for Table Decoration.

"A very ingenious and successful device. I observe that you have another bed of Kochias, with Violas."

"The Violas are Imperial Blue, and the edging Geranium Mrs. Pollock. We raise the Kochias from seed in February, pot them off, and plant them out at the end of May. The flowers are very useful for table decoration. You will notice that the only creeper on the Court is Ampelopsis Veitchii. The six large vases on the terrace are filled with Bays, Golden Yews, and Golden Privet, two of each. Both Portugal Laurels and Bays flourish at the corner here; the subsoil is clay, and it suits them."

"I should think that it also suits Hollies," I rejoined, as we proceed along the drive towards the back lodge, where clipped shrubs of various kinds are a feature.

"Yes, it does; and all they require is careful trimming. The varieties are Ilex Hodginsii, scotica, Waterer's Gold, Golden Queen, aurea marginatum, Handsworth Silver, and common green. Yews in variety also predominate."

A Border of Perennials.

Descending the grass banks, a border of shrubs, including Prunus Pissardi, Acer negundo, and Acers in variety, with perennials in front, suggested a question as to the names of the latter, and Mr. Arthur replied:

"Chiefly Iberis in variety, Pentstemons, Anchusa italica, St. John's Wort, Sweet Alyssum, Verbascum olympicum, Campanula pyramidalis, Sedum spectabile, Statice latifolia, Aubrietias in variety, Veronicas in variety, Gypsophila paniculata, Lupin Snow Queen, Marguerites in variety, Scabiosa caucasica, and Spiræas in variety. In another long bed are similar shrubs with a quantity of Michaelmas Daisies in variety in front; and in the large bed beyond Cactus Dahlias and Irises are used with the shrubs. Then, there are the beds at the entrance to the Rose garden. Two of these are made up with Kleinias and Liliums in variety, and an edging of Ericas in variety; the other two with mixed Azaleas, one edged with Crimson Rambler Roses, and the other with Dorothy Perkins. The former has been a marked success. We have had it five years, and for six weeks we get masses of bloom."

A Remodelled Rose Garden.

"When was your delightful Rose garden planted?"

"It was originally made and planted thirty years ago. I started remodelling it last year, and am now engaged in getting distinct varieties for each bed."

"How many beds are there in the garden?"

"Twenty-three, some very large. Then, there are six arches and a chain, two pillars of Golden Hops, and ten pillars of Golden Hollies, all edged by clipped shrubs and flowering trees."

"And the edging of the Rose beds?"

"Three are edged with Ischarum; one with Virginian Stock; two with Saponaria calabrica; four with double white Arabis; four with Ajuga purpurea; two with Mignonette; one

Digitized by Google Original from CORNELL UNIVERSITY

with Nemophila insignis; one with Tagetes; and two with Linaria Sutton's Snow White and Golden Gem."

"I should like to have the names of the varieties of Roses."

"Hugh Dickson, La Tosca, Madame Abel Chatenay, La France of 1908, Caroline Testout, Richmond, Prince de Bulgarie, Gruss an Teplitz, La France, Frau Karl Druschki, Baroness Rothschild, Boule de Neige, and Papa Gontier. The climbers used are Crimson Rambler, Dorothy Perkins, Hiawatha, Lady Gay, The Lyon, The Wallflower, Leuchstern, Tea Rambler, Paul's Carmine Pillar, Philadelphia, Blush Rambler, Waltham Rambler, Thalia, and Longworth Rambler."

"Do you frequently enrich the soil?"

"Every year. I have trenched the ground and elevated the soil lately."

"The Rose garden, in addition to the admirable arrangements, gains by its surrounding."

"Yes; the belts of trees help to render it picturesque, and the raised bank at the end—with climbers at the back, and Azaleas, Foxgloves, and Violas in front—improves the appearance. The Hollies, including the pyramids, belong to the varieties I have already named."

FAN COURT, CHERTSEY.

A Splendid Herbaceous Border.

At Fan Court there is a very attractive approach to the kitchen garden; and in the garden a splendid border running the whole length, with the glasshouses on the right, and the orchard on the left, challenges admiration.

"What are the dimensions?" I enquired.

"A hundred yards long and seven feet wide. The border is planted so as to have a great display of autumn flowers."

"And you have secured it in a striking manner. Perhaps you will first mention what you depend upon for the background?"

"Clumps of Sweet Peas are one of the features. The varieties are Miss Willmott, King Edward Spencer, Picotee, Frank Dolby, Lady G. Hamilton, White Spencer, Evelyn Hemus, Norah Unwin, and Gladys Unwin. Dahlias also are used considerably, such as Henry Stredwick, Spitfire, Champion, Floradora, and some of the Singles."

"I notice that you have some Pæony-flowered."

"Yes. Lady Stern is very pleased with them, and I think they promise to be a valuable addition. Duke Henry is very fine, and so is Queen Emma. Other tall-growing flowers include Heleniums in variety."

Heleniums for Table Use.

"You have glorious clusters of one variety of Helenium."

"You mean H. grandicephalum striatum, orange, striped with crimson. It is grown from cuttings quite easily, and it makes a splendid table decoration, lasting for two or three weeks. Michaelmas Daisies are, of course, largely used. Marguerites in variety, Tritomas, Cosmos, Nicotiana affinis and Sanderæ, Ceanothus Gloire de Versailles, and Tree Pæonies."

"Looking up the slope, gold, crimson, and white seem to predominate. I think we should add some of the varieties in front."

PERPETUAL-FLOWERING CARNATIONS AT FAN COURT, CHERTSEY.

"One of the prettiest effects is contributed by Godetias Duchess of Albany, and Antirrhinums in variety. Calceolarias Golden Gem, dwarf Fuchsias, and Zinnias in variety are also specially helpful."

"You have a healthy lot of Japanese Chrysanthemums in pots outside."

"The Japanese and Singles are the favourites. We grow altogether about six hundred, using the smaller varieties for boxes in the house. Out of one hundred varieties, the best Japanese are J. Locke, Master James, Hon. Mrs. Lopez, Purity, Algernon Davis, Arthur Mileham, Bessie Godfrey, Edith Jamieson, Formality, General Hutton, Henry Perkins, H. J. Jones (1908), Jumbo, Lady Talbot, Leslie Morrison, Magnificent, F. S. Vallis, Mrs. A. H. Lee, Mrs. A. T. Miller, F. W. Vallis, and Mrs. G. Heaume."

The Cultivation of Primula obconica.

"Now we are beginning the houses, I should be glad if you would mention the special features briefly."

"One of these is certainly Primula obconica gigantea. I always show this, and invariably get first prize. In fact, I have never been beaten."

"Then your method of cultivation will be very interesting."

"I grow my Primulas, about one hundred, in a very cool frame, in a compost two parts loam, one part leaf-mould, and one part silver sand. To keep the insects out, it is very important to protect the plants from the hot sun. I use Clay's Fertilizer occasionally, and always secure plenty of flowers."

"The foliage seems equally good, but does it ever affect you injuriously?"

"No, it never hurts me; but I always let it flag a little before cutting—this takes the sting away. These plants flower all through the winter up to April. In the house we are now entering, Cannas are the feature. The strain is a German one, and the prevailing colours are crimson, orange, dark yellow, gold, and pink. This is the first season, and I am well satisfied with their appearance. In this house, also, is Eucalyptus globulus, which we shall plant out next winter; the seed is sown every year."

"You have a nice arrangement for your Ferns in the next house."

"We wire the moss on the wall, and Ferns grow into it, with Begonia Rex behind. The

Digitized by Google Original from CORNELL UNIVERSITY

stage is filled with Orchids—Cattleyas, Odontoglossums, Cypripediums and Dendrobiums. But Carnations are much more a feature than Orchids."

Tree Carnations Outside.

"How many Carnations do you grow?"

"About six hundred. We plant the Trees outside. This is the third season we have done so. They flower indoors all through the winter, and are put out in the spring, where they yield blooms until the frost stops them. I believe that in the future Tree Carnations will be grown very largely outside. The indoor plants are just coming into flower. The varieties are May Day, Mikado, Winona, White Lawson, Cardinal, Britannia, Aristocrat, Enchantress, Mrs. H. Burnett, Rose-pink Enchantress, White Perfection, Lady Bountiful, Afterglow, Mrs. Tallon, Red Ridinghood, Octoroon, Jessica, Robert Craig, and Countess of Onslow."

"Do you grow more Malmaisons than Trees?"

"Yes, four hundred as against two hundred Trees. This house is entirely devoted to them. Duchess of Westminster is the best variety. Other Malmaisons are Marmion, Lady Grimston, Maggie Hodgson, Mrs. Martin Smith, Saulte, Monk, Nautilus, Prince of Wales, Mercia, Prime Minister, Nell Gwynne, King Oscar, and F. Galsworthy."

"In the intermediate house," continued Mr. Arthur, "Begonias Gloire de Lorraine, Coleus, Acalyphas, Bouvardias, and Celosias are conspicuous. We go in rather largely for double Petunias, pink and white."

"How do you get such fine flowers?"

"I take the cuttings every year, after flowering in the spring, and put them in cold frames. These have been in flower all the summer. The little blue flower which you see in this house is not often grown. It is called Ophiopogon, and requires greenhouse treatment. In the stove, Allamanda Hendersonii has been flowering all the summer, also white Stephanotis. Here are grown Tomatoes inside. The only variety used inside and out is Carters' Sunrise. Calanthes and Crotons are grown in quantity. The only Violets grown in frames are La France and Marie Louise, but we go in for a large number. Tulips and Irises are grown in large quantities for cutting out of doors."

"I observe that you have Roses on the wall of one of the Peach houses."

"We get flowers from these nearly all the year round. The varieties include Falcot and Niphetos. The Peaches which follow in succession are Early Rivers, Cardinal, Early York, and Waterloo; and Nectarines Humboldt and Lord Napier."

"How many Vineries are there?"

"Three. In the early house Black Hamburgh is the only variety. The Begonias which you see in this house are for showing in November. Some of them are two and a half feet high, and two feet through."

"Both in respect to size and symmetry they are exceptionally fine. What are your mid-season Grapes?"

"Muscat of Alexandria, Black Hamburgh, and Black Alicante. This is still a very good Vinery, though it is forty years old. Then, in the late house are Muscat, Gros Maroc, and Black Alicante. Three years ago I inarched Gros Maroc on a Black Hamburgh stem. I have done this twice, and the result is very satisfactory. There is no doubt that Gros Maroc does better on Black Hamburgh stem than on its own."

"You have a good deal of fruit outside also?"

"Peaches, in several varieties, do well on the south wall, and enable us to prolong the succession from July until October. The latest variety is Devonian. On the south wall we also grow Plums and cordon Pears, Plums being chiefly Golden Drop, Early Orleans, and Greengage. The Pears are Marie Louise, Doyenne du Comice, and Pitmaston Duchess. The north wall is literally covered with Morello Cherries, and on the east, late varieties of Plums are grown."

A Pergola of Fruit Trees.

"You must have a quantity of fruit on the pergola."

"The pergola consists of Pears and Sweet Cherries. The former, which cover one side, include Beurre Hardy, Fondante d'Automne, Thompson's, Durondeau, Beurre Bosc, Clapp's Favourite, and Brockworth Park. The Cherries on the other side are Governor Wood, Early Rivers, Frogmore Early Bigarreau, and Bigarreau de Schreken. The pergola, which has a border of Mrs. Sinkins Pink below, was only made three years ago."

"What about Apples?"

"The Apples, as well as more Pears and Plums, are grown in the orchard just beyond the kitchen garden. They are all standard trees, and the principal Apples are Cox's Orange Pippin, Blenheim Orange, Cockle's Pippin, Fearn's Pippin, Gascoyne's Seedling, Worcester Pearmain, Bramley's Seedling, and Wellington."

"We have not mentioned Strawberries or Raspberries."

"The varieties of the former are Royal Sovereign, Laxton's Latest, Laxton's Reward, British Queen, and Comte de Paris. Raspberries do wonderfully well here. The variety Semper Fidelis is very prolific, and on another fence we grow Red Antwerp. The yellow Raspberry is also grown. There are plantations of Gooseberries and Currants."

Special Vegetables.

"Have you any vegetables of a special character?"

"Celery is rather a feature. We have about six hundred plants, the varieties being Sutton's Solid White and A1. Endive is grown in large quantities, and also Lettuces. The varieties of Peas include May Queen, Empress of India, Duchess of York, Invincible, Sutton's King Edward, Eureka, Royal Jubilee, Giant Marrowfat, Autocrat, Gladstone, Exhibition Marrowfat, and Sutton's Latest of All. Haricot Beans are a feature. We leave them to dry, and shell in the winter. The most prolific and best variety is White Haricot. Most Potatoes are grown in a field, but a few early varieties in frames, such as May Queen, Early Kidney, Sharpe's Victor, King Edward, Come to Stay, Table Talk, and Duchess of Cornwall."

"How long have you been here, Mr. Arthur?"

"Thirty-seven years. I have been here with four families, and twenty-three years with Sir Edward Stern. I came as foreman, and twelve years ago the management of the gardens was entrusted to me."

"You have done a good deal of showing?"

"I show locally at Addlestone, and have taken a good many first prizes for groups of foliage and table plants, also fruit. In 1909 I took nine prizes. For the whole twenty-three years since Sir Edward had Fan Court, we have done the dinner tables in London."

Dinner Combinations.

"Perhaps you would tell me some of the combinations you have used?"

"This year, at a dinner party in May, the tables were done with Schizanthus (pink and white), Asparagus Sprengeri, and Gypsophila elegans. In June we used orange and yellow Azalea mollis, with Asparagus Sprengeri and white Saxifrages. In July, Malmaison Carnations were used, upwards of three hundred blooms, deep pink, red and white, with Asparagus Sprengeri and Maidenhair Fern. We also use for the tables in London, red and pink Roses, red and pink or lavender or orange Sweet Peas. At Fan Court, blue flowers are used for the luncheon tables, notably Asters crenata and Salvia patens. For dinner Chrysanthemums are largely used, and, during winter, retarded Lilies of the Valley, Roman Hyacinths, and Orchids. In the spring, as long as possible, Daffodils are used. Throughout the whole of this time, table decorations have been a special study of mine, and I hope with some success."

ALFRED WILCOX.

[Since the above was written, Mr. Arthur gained the following awards at the Addlestone show in November: Six first prizes, viz., for Grapes, Begonia Gloire de Lorraine, Primulas, table plants, bush Chrysanthemums, and Salvias; two seconds for a group and a vase of six Chrysanthemum blooms of F. S. Vallis; third for Brussels Sprouts. He gained twenty-three points, and won the silver medal presented by Messrs. Toogood, of Southampton, for the highest marks.]

THE HERBACEOUS BORDER AND GLASS RANGE AT FAN COURT, CHERTSEY.

NEXT week's interview will embody a description of the gardens of the Duke of Wellington, at Stratfieldsaye.

Digitized by Google Original from CORNELL UNIVERSITY

border, and, though repeated attempts have been made to confine them to a small area, isolated clumps still linger elsewhere, and, as they throw their seeds in all directions—Lord Avebury puts the distance at as much as ten feet—the ground around becomes covered with seedlings, many of them hidden among the herbaceous perennials, and escaping the hoe or weeding fork. It is useless to rely on picking off the flowers in spring. Most of the seed is borne in closed capsules—cleistogamous flowers, as they are called, relics of the time when the Violet was a water plant, and had to guard its pollen from moisture—and these later flowers hang down under the leaves, and are not easily seen. Another plant which is often very troublesome in or near a garden is the Elder. It flowers and seeds profusely, and though it does not, like the Violet, possess any means of dispersing its seeds, this is done by birds, especially blackbirds and thrushes. Under any tree in which they are fond of perching, seedling Elders spring up by the score. Indeed, it is not uncommon to see a small Elder actually growing out of an old Pear or Apple, as the result of the seed having fallen into a fork or hole where some soil had gathered. Pansies behave in the same way as Violas, but are much more useful. There are generally plenty of places where the seedlings may be planted to cover the ground.

A Plague we have lacked.

August 13th.—From one plague we have been singularly exempt this season—Cabbage caterpillars. Last year, and also the year before, great numbers of Cabbages had to be destroyed, they were so infested, but so far this year they have been almost free from the pests. Certainly, I noticed some white butterflies in spring, for my cat spent much of its time in chasing them, and succeeded in catching one or two—a fact which must be put to the credit of a cat in a garden—but there were unusually few of them. As the cause of their scarcity can hardly be want of food, it must probably be connected with the weather last winter. Unfortunately, there is still time for the caterpillars to appear in greater numbers. The small white Cabbage butterfly has two broods in the year, the second appearing in July or August. As the result of the cold summer, they are likely to be rather late this year. They must not be confused with the caterpillars of the Cabbage moth. These, though equally destructive, are quite different in appearance, smaller, darker in colour, and mottled on the back.

The Silver Fir.

August 14th.—There is no Conifer more beautiful or more distinctive than the Silver Fir. It looks best when associated with other evergreens, standing out against dark green background, but even when it is more isolated, it is a tree which instantly attracts attention. As it is rather slow in growth, it may be planted in comparatively small gardens, but in the atmosphere of a town it is rarely satisfactory.

H. C DAVIDSON.

The Gardens at Billingbear, Wokingham.

INTERVIEW WITH MR. FRANK ASHMAN.

BY the courtesy of Mr. Charles T. Crews, the tenant of Billingbear, I had the pleasure of visiting the gardens last month. Billingbear, which belongs to Lord Braybrooke, is one of the famous historic seats in Berkshire, and is situate about equal distance from Wokingham and Twyford. The mansion itself is approached through a glorious park covering upwards of two thousand acres, timbered with splendid trees dating back to the time of Henry VIII., when the estate belonged to the abbots of Winchester. Mr. Frank Ashman, who has charge of the gardens, and resides in a pretty house close to the entrance to the pleasure grounds, deprecatingly said that there was not much to be seen, but before I left Billingbear I came to a very different conclusion. We first made our way to the terrace, passing a pair of fine Cedars planted in 1801, facing which are golf links a mile and a half in extent. The mansion is a Tudor building, and the Ivy, with which the front is covered, suits the architecture. The bedding below the terrace is on an elaborate scale, with a large Lily pond in the centre.

A Design of 1801.

"The design," said Mr. Ashman, "is either Italian or Dutch, and it was executed when the gardens were made, upwards of a century since."

"When the Cedars were planted?"

"Yes, in 1801. The Lilies in the pond include a number of the Marliacea varieties, such as chromatella and sulphurea. The other Nymphæas include Gladstoniana, Robinsonii, Froebelii, and gloriosa, with alba, the British species, in the centre. The latter has been in the pond for upwards of thirty years, but I planted the others."

Forty-four Beds.

"How many beds does the design comprise?"

"Forty-four. They are never alike two years in succession. Sometimes taller-growing plants are used, but this year they are flatter. As far as possible, the beds are of one colour, the idea being to obtain as many masses of colour as possible. For example, there are eight beds of scarlet Geraniums, the variety being the Rev. Atkinson, which is one of the best for beds of a moderate size."

"Is the number of beds containing masses of Marguerites the same?"

"Yes, eight; and in September we get a mass of white flowers, the variety being Queen Alexandra. The Marguerites are intermixed with Helianthus Black Nigger. These beds are rather higher than the others. Then, there are four beds of Geranium Chelsea Gem, a pink flower, with pretty foliage. These, too, and, in fact, all the flowers, are at their best in September. We plant with that object in view. Four more beds are filled with Ageratums of heliotrope colour. The variety is a seedling which we raised here, and kept to one colour by using cuttings."

"Many of your beds are planted with Heliotropes."

"Yes; the variety is Lord Roberts, and there is an old variety of Fuchsia. There are eight of these. Four beds are filled entirely with Little Pet Geraniums. In two there is a combination of Abutilon Thompsonii and Coleus Verschaffeltii; and another combination is Abutilon Savitzii, with a groundwork of Ageratums. As to the other beds, there are two of Crystal Palace Gem Geraniums at the corners, two of Coleus only, and four of MacMahon Geraniums, the handsome foliage of which makes a nice show."

"Can you tell me roughly the number of plants bedded out in the design?"

"Very nearly twenty thousand, and, as you see, they are all edged with Box. Probably you have noticed that plants on one side are growing better than on the other. They get more sun. The soil is very heavy clay, wet and cold."

"How are the borders on either side of the design filled?"

"The border under the Magnolia wall, so-called because it is covered by Magnolia grandiflora, has Cactus Dahlias at the back, chiefly pink, yellow, and white, with plants of corresponding colour, as far as possible, in front. The border under the Laurel hedge is similar."

"The May tree, with a branch of Mistletoe, at the corner of one of the borders, must be of considerable age?"

"Fifty years, if a day. One of the workmen on the estate, who is seventy years of age, remembers it as a boy. The fine specimen of Acer negundo near one of the Cedars has been there a long time."

"The estate," I observed, as we proceeded to inspect the terrace border, "must be very extensive."

"It is seven miles in circumference, and includes nine hundred acres of woods. On the lakes, which you can see from here, there are about four hundred ducks. The border, which runs the whole length of the terrace, is planted chiefly with Alternantheras, Dactylis (the silver-leaved), Abutilons in variety, Salvias (Pride of Zurich), and Begonias Rose Queen."

"I suppose that you vary the contents of the French vases?"

"Every year we make a change. This year we are using Marguerites; another year the vases may be filled with Geraniums. The Florentine figures of the shepherd and shepherdess at the bottom of the terrace steps are two hundred years old. In the borders under the mansion are Nicotianas in variety, Coleus in variety, and Chelsea Gem Geraniums."

An Avenue of Oaks.

From the garden front we proceeded to the carriage entrance at Billingbear, which is very stately. Facing the house is a noble avenue of Oaks, five hundred yards long. For a great many years this was the direct approach from Windsor, but the roadway has long since been disused.

"How old are the Oaks?" I enquired.

"I can scarcely tell you, but Oaks live to be eighteen hundred years old, and there is still plenty of life in these, though the clay soil keeps down the height of the trees. The Elms, I think, have reached their full age, which is about three hundred years."

"You have a fine expanse of lawn for tennis, and a fine show of bloom under one wing of the mansion."

"You refer to the Epilobiums. There has been a show of bloom since May, and it will last into September. The Epilobium grows wild in the coverts, and it looks exceptionally well, grown in conjunction with the Bracken Ferns."

"Yes, the green of the Ferns blends with the magenta flowers."

Roses Old and New.

The Roses at Billingbear are grown in the kitchen garden and its environs, which are very charming. In conjunction with a number of fruit trees, there is a succession of beds grown as standards and bushes.

"Some of the best of these," said Mr. Ashman, "are Frau Karl Druschki, La Tosca, La France, Lady Clanmorris, Viscountess Folkestone, Bessie Brown, Queen of Spain, Prince de Bulgarie, Madame de Watteville, Etoile de France, Countess of Caledon, Auguste Guinoisseau, and Marquise Litta. We get a mass of flower, very useful for decorating, from old

Digitized by Google Original from CORNELL UNIVERSITY

pieces of Maiden's Blush, which are trenched every few years, and then planted again. But we cut from all these Roses. Now, I will show you some that we do not cut."

"You mean the two long borders which we are approaching."

"Yes, these borders are each about a hundred yards long. One side was planted three or four years ago, and the other last spring. They are practically all new varieties, upwards of a hundred in number. Some of the best are Alice Lindsell, Perle von Godesberg (a very beautiful cream), J. B. Clark, Countess of Derby, Countess Annesley, Mrs. Aaron Ward, Elizabeth Barnes, Lady Battersea, Lady Ashtown, Betty, Joseph Lowe, Dean Hole, Madame Cadeau Ramey, Gustave Grunerwald, Jacob's Perle, Pharisaer, Daniel Harrison, Mrs. Conway Jones, Mrs. G. W. Kershaw, Miles Kennedy, Hugo Rollen, and Mrs. David Jardine."

BILLINGBEAR FROM THE GARDEN.

Pæonies for Cutting.

"I see that fruit is a great feature in your kitchen gardens, but before we allude to it I should like to make notes of some of the other flowers which help to give such a delightful appearance to the place."

"Pæonies, you see, are rather a feature. We find large flowers the most useful for cutting. In the Pæony beds are Asters in variety, the whole being edged with double Arabis. Then, in the mixed border, are Stocks and other annuals, but no herbaceous plants. Of Chrysanthemums, we grow about eight hundred Japanese and Incurved; and, of the Sweet Peas, the principal are Eckford's Special and the Spencer family. We prefer the pink and white. I sow in pots in October, and some are planted out in clumps of one colour, and others in rows."

"You have a splendid lot of Black Currants."

"Probably the explanation is that I never buy bush plants, but raise my own. The varieties are the Old English and Boskoop Giant, but I greatly prefer the former. The fruit will hang till the trees wither, and they crop as well as this almost every year. I give them plenty of manure."

"The crop of Red Currants seems to even exceed in wealth that of the Blacks."

"Some of the trees are literally breaking down with the weight of the fruit. The varieties are an old one which I found here, and Versailles. All of them are netted, and I find that the practice of late pruning answers."

"What are the varieties on your equally loaded Gooseberry trees?"

"Only two, Red Warrington and Berry's Early Kent, the latter a large green Gooseberry. How well it deserves its name may be gathered from the fact that we picked our first supply this year before Gooseberries could be obtained in Covent Garden Market."

THE LILY POND AT BILLINGBEAR.

Apples and Pears.

"Have you many varieties in your Apple walk?"

"Between thirty and forty, of which the best are Cox's Orange Pippin, Charles Ross, Blenheim Orange, Houblon, Peasgood's Nonsuch, The Queen, and Beauty of Kent. I prune both Apples and Pears when they make their terminal bud. I believe in late summer pruning."

"Which are your principal Plums and Gages?"

"Of the twenty varieties, the best are Kirke's, Pond's Seedling, Angelina Burdett, Victoria, Orleans, Washington, Black Imperial, Diamond, Rivers' Early, Monarch, and Autumn Compote. The Gages are Transparent, Denniston's Superb, Jefferson's, Golden, and Reine Claude de Bavay. On our Peach walls we have Hale's Early, Dymond, Goshawk, Stirling Castle, Bellegarde, Barrington, Early Mignonne, Early Grosse Mignonne, Noblesse, and Dessie Jardine, a lovely Peach. The Nectarines are Rivers' Early, Precoce de Croncels, Pitmaston Orange, Stanwick Elruge, Pineapple, and Humboldt."

Apricots and Strawberries.

"Do Apricots flourish here?"

"We get a fair crop every other year, and grow several varieties, including Shipley's, Early Red, Moor Park, and Peach."

"Your Strawberries are fruiting grandly."

"You allude to Latest of All, the only other variety I grow being Royal Sovereign. The former does particularly well on this soil, and fruits up to August. I only keep the plants three years, and then throw them away. Also, I disbud Latest of All, and only leave the crown fruit."

"When do you pick your earliest Peas?"

"In June. I strongly recommend The Pilot. It is a sort of improved Gradus, but, though Gradus is good, The Pilot is better. It must not, however, be grown as a first-early. I tried it for this purpose, and was disappointed. Then I tried it again, sowing on February 4th, with the most satisfactory results. We began to pick the third week in June, and the variety is a magnificent cropper, as well as of very fine flavour. It comes in three or four days before Gradus."

"How many Peas do you sow?"

"About twenty-four quarters. I sow Veitch's Mammoth on March 27th, and it is ready on July 15th. Goldfinder is a very heavy cropper, and perhaps the best Pea for a large family. We have two rows of it. Other varieties are

Digitized by Google Original from CORNELL UNIVERSITY

Lord Rosebery and Gladstone. Lettuces are grown alternately on the ridges with French Beans. The best Cauliflower is Snowball, which merits its name."

"What about Potatoes?"

"Seed from Scotland is used every year. We do not suffer from any disease. It is a mistake to let Potatoes stop in the ground too long. Directly the flowers have ceased, the haulm should be cut off. I dig up my Potatoes before the skin is set, and store them away."

Vines without Made Borders.

Then we entered the Vineries.

"I should explain," said Mr. Ashman, "that the whole of these Vines were planted on garden soil. There is no special drainage, and the roots run where they like in the garden."

"Do you mean that the borders were not made?"

"I do. There is not a single 'made' border. Most of these Vines were planted, in 1869, on the solid clay, two feet down, and I have since planted others on the same principle. The varieties are Black Hamburgh, Barbarossa, Buckland's Sweetwater, Trabbiand Muscat, Mrs. Pince, Gros Maroc, Gros Colmar, Alicante, Lady Downe's Seedling, and Madresfield Court. They have cropped every year, at any rate, during the five and twenty years I have been here. The Muscats carry eighty bunches a year; the Hamburghs, fifty to sixty bunches weighing three pounds each, and a Barbarossa which I planted yielded a bunch weighing over seven pounds. These facts tend to prove that a lot of the inside borders are not requisite. Of course, I feed them outside with a fertiliser, putting on from three to four hundredweights. The Chrysanthemums are brought in here, and do no harm."

Peaches from Old Trees.

"You have a brave display of Peaches inside."

"The Peaches are Dymond, Raymaeker's, and Barrington; the Nectarines, Humboldt and Pineapple. A Humboldt and a Dymond were planted in 1869, so that there is no doubt that trees of a great age will yield fruit. In the late Peach house, the Peaches at the back are similar varieties, and in front the Nectarines are Pineapple, Cardinal, and Early Rivers. Here is the early Vinery, which was put up about sixty years ago. We cut Grapes in this house at the end of May. The crops in the Fig house are very satisfactory, the varieties being Brown Turkey, Negro Largo, Bourjassotte, and Black Ischia."

"Which of your Cucumbers do you find most useful?"

"Veitch's Favourite and Market Favourite. You may care to know that I stopped Cucumber spot by putting carbolic and water in a saucer in the house. There are four batches of Melons, the varieties being Hero of Lockinge and Blenheim Orange. Earlier in the year I fill this house with Beans, which we were pulling in February. The Melons I start in pots."

The Plant-houses.

"Are there any special features in the plant houses?"

"There are only a few Orchids, chiefly Cattleyas gigas, Gaskelliana and Mossiæ. We find Begonia Lafayette not only useful for bedding, but also for buttonholes. We grow it likewise for decorating the table when we want a scarlet scheme of colour. I grow between four and five hundred Amaryllis, and cross the strains; and, finally, here is the Pine stove."

"You grow Pines in pots?"

"Yes, and they are just throwing up fruit. The varieties are The Queen, Prince Albert, Charlotte Rothschild, and Cayenne. Pines are quite easy to grow, but the soil must be prepared. I use a mixture of leaf-soil, sand, loam, and manure. We do not show, and, with regard to myself, I think it is sufficient to say that I have had charge of these gardens for a quarter of a century."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 368.—GOOSEBERRIES AND RASPBERRIES.

DEAR KATE,—I think many gardens are somewhat lacking in the matter of fruit-growing. I do not mean Apples and Pears, so much as the smaller fruits, for we have not all room for trees, but the smallest garden can grow Gooseberries, for instance, and there is no more useful fruit, whilst few plants are so accommodating, for they will grow on a paling or as a bush, in sunshine and in shade, needing little in the way of cultivation (except an occasional mulch of manure in the spring), and seldom fail to produce a good crop.

We find Whinham's Industry an excellent and most prolific red variety; Keepsake and Early Duke come in the first of all in May; and Golden Drop and Langley Greengage are amongst the finest in flavour for eating ripe.

A DEVONSHIRE COTTAGE.

Gooseberry Pests.

I am sorry to hear that Gooseberry mildew (an American blight which has unfortunately crossed the Atlantic) is doing much damage to the Gooseberries in some districts. I cannot tell you how to combat it, as I have never seen it, and it has not yet invaded these parts, I believe, but I think it would be best to burn any infected plant at once, and purify the soil with gaslime, as it is highly infectious, and quickly destroys the whole bush. In buying fresh plants, you should get them from an area free from this terrible blight, and avoid using the same soil or position for the young Gooseberry bushes for several years, if mildew has been present. Gooseberry caterpillars are the other special enemy of this fruit; these insects, as larvæ, winter in the soil surrounding the bush, and can then be destroyed by removing the upper soil to the depth of three or four inches (taking care not to injure any roots), and burning it. A good sprinkling of hot lime (just slaked) should be laid over the soil (after taking away the upper layer), and fresh soil (from another part of the garden, where no Gooseberries grow) can be used to fill up the space to the surface. As an additional precaution, it is desirable to dust around the trees with Vaporite (or some such useful stuff) in February, lightly forking it into the surface.

In a severe case, it may be well to examine the bushes in the early spring (after this treatment), in case any insect should have escaped, and syringe them with some good soapy water used warm; Gardo is a useful soap for the purpose, which we find an excellent insecticide. But do not use any poisonous wash or dust the fruit (when once formed) with Paris green, or any other horrible poison (as too often recommended). A Paris green pie is not a wholesome dish (for verdigris is one of the deadliest of all poisons), and one cannot be sure that a child passing through the garden may not taste a green Gooseberry, with terrible consequences. The light way in which these deadly things are recommended, without any warning, fills me with horror, and probably few gardeners are aware of this danger.

Pruning and Propagation.

Gooseberry bushes make an excellent hedge, through which no cats or dogs care to pass. You can train the bushes on stakes (or broad-meshed wire netting fixed to stout stakes at intervals), when young, and they will quickly keep out all intruders; but the pruning of the Gooseberries must be attended to each year in the winter. Do not, on any account, take the shears and snip off all the young points, for it is on these that the following year's crop is produced, but cut out from the stem any growths which threaten to crowd the others, so as to keep the middle of the bush thinly furnished, whilst you should only shorten the new growths where they might otherwise reach the ground, and preserve all you can of them.

Cuttings of Gooseberries are easily rooted, and can be put in either in October or in February; they should be long, straight pieces of the younger growths, fifteen to eighteen inches in length, if possible, as it is very desirable to have a single stem a foot long for the young bush, and yet you need to bury the end of the cutting firmly six inches down. Young Gooseberry bushes begin to bear fruit when two years old, and can be put into the garden best in the autumn; the soil surrounding them should be kept free from weeds, and open to the air, with the Dutch hoe; but, as in the case of all other fruits, the spade should be kept at a distance, as any injury to the roots is to be avoided.

How to Plant Raspberries.

Another valuable fruit for all gardens is the Raspberry, which can be trained on a wall or wooden partition very easily by means of wire (or even stout string) on long nails, yearly, as all the old growths are removed as soon as the crop is over. If there is room for a plantation of this delicious and most wholesome fruit, suckers should be put into deeply-dug and well-manured ground in November (as soon as the foliage drops), choosing a position as moist as possible; and it is very necessary that the roots should not be dropped into a hole, but spread out horizontally about four inches below the surface, treading them in carefully and firmly, for these roots will in time extend for many feet around the plant, just below the surface, and it is on their being preserved intact

MR. BEN ASHTON,
Gr. to the EARL OF LATHOM,
Lathom House, Ormskirk.

THE FRUIT AND VEGETABLE SHOW.

OUR PORTRAITS.

IN connection with the Vegetable Exhibition and Conference held on Tuesday last at Chiswick, we have reproduced the portraits of a few British gardeners who are good "all-round" cultivators, and who have shown a special preference and interest for the cultivation of choice vegetables and fruit. In the present day, when there appears to be an inclination in some quarters to regard the cultivation of kitchen garden crops with a certain degree of indifference, it is good policy on the part of the Royal Horticultural Society to endeavour to show by the proceedings of the past week that kitchen gardening forms one of the most important departments that can be undertaken by a first-class gardener. When a gentleman is about to engage a gardener, he very naturally expects that, whatever additional capabilities the candidate may possess, he at least will be able to produce first-class crops of fruit and vegetables.

As examples, therefore, to young men about to commence their work, the careers of the following gardeners may be studied with profit :—

MESSRS. ED. BECKETT, J. GIBSON, &c.

The two lions in the Vegetable world to-day, especially from the exhibition point of view, are of course Mr. Ed. Beckett, gr. to Lord Aldenham, Aldenham House, Elstree, and Mr. J. Gibson, gr. to R. W. Hudson, Esq., Danesfield, Marlow. But it is not necessary to publish separate portraits of them in this issue, as, being members of the Committee responsible for the Gardeners' Dinner, their photographs appear on our Supplementary Illustration. The same may be said of Mr. James Hudson, who was the author of a paper read at the Conference on the cooking of vegetables, Mr. James F. McLeod, Mr. Owen Thomas, Mr. Geo. Woodward, Mr. Norman, Mr. Fyfe, Mr. Markham, &c.

MR. BEN ASHTON.

The following particulars, furnished us by Mr. Ben Ashton, gr. to the Earl of Lathom, Lathom House, Ormskirk, Lancashire, are interesting :—

"A native of Nottinghamshire, I commenced my gardening career at a very early age in the gardens of Babworth Rectory, near Retford, in March, 1867, under the late Job Smith, who was a pupil of the late T. Speed, of Chatsworth. Mr. Smith was a very able gardener but a very severe taskmaster, which was perhaps a good thing for a somewhat mischievous youngster. After serving an apprenticeship of four years I went to Little Ponton Hall, Grantham, under the late Jos. Towers, but remained only a few months, going afterwards to Nocton Hall, Lincoln (at that time one of the seats of the Marquis of Ripon), as kitchen-garden foreman under Mr. Ridsdale, where I stayed nearly two years. From Nocton I went as journeyman under that celebrated Pine and Grape-grower, the late Joseph Jefferson, Carlton House Gardens, Worksop. If space permitted I should have liked to give some details of Mr. Jefferson's method of Pine-growing. I had not been with Mr. Jefferson many months before he gave me charge of the Pine-stoves and Vineries, and I need hardly say that I was then in my element. I remember his sending me to a noted local show with a quantity of fruit, and his joy at my coming back with eleven 1st and two 2nd prizes for thirteen entries. After serving Mr. Jefferson a little over two years I went as first journeyman at Ashburnham Place, Battle, Sussex, under Mr. Maxton, where I gained much useful knowledge in hardy fruits, &c.

"From Ashburnham I went as flower-garden man to that fine old gardener, Mr. Jno. Derricutt, Pye Nest Park, Halifax, who I am happy to say is now enjoying a well-deserved pension from the Gardeners' Royal Benevolent Institution, of which he was a staunch supporter for many years. After five months I was made foreman. I may here say that Mr. Derricutt was the finest propagator and plantsman that it was ever my good fortune to serve under. He was also an expert Pine and Grape grower, which will be readily understood when I say that he grew in 11-inch pots Black Prince Pines weighing as much as 10 lb. 8 oz., a photo of which I possess at the present time. I left my kind master and friend at Pye Nest after two years' service to go as foreman to another noted gardener, Mr. Robt. Milne, Vale Royal, Northwich, Cheshire, and while with Mr. Milne I created a mild sensation by growing in 7-inch pots Poinsettias with bracts measuring 22 inches in diameter. Many other things were at that time grown well at Vale Royal, notably Calanthes, specimen Mignonette, Eucharis, Begonia Ingrami, &c., in addition to fine Grapes and Peaches; carpet bedding was done on a large scale.

"From Vale Royal I went as foreman to Thurcroft Hall, near Rotherham, where I only remained a few months; after which I went as head gardener and manager to the late Selina, Viscountess Milton, Kirkham Abbey, York, in March, 1881. Her ladyship dying in 1883, I remained with her son, the present Lord Hawkesbury of Hazelbech till March, 1885, when I left to go as gardener to Lord Howard of Glossop, Glossop Hall, Derbyshire, where I remained eleven years. I may here remark that Glossop, from a gardener's point of view, is one of the worst districts in the British Islands, being wet, cold, and the atmosphere soot-laden; successful vegetable cultivation there was quite out of the question.

"I left Glossop to come to Lathom in January, 1896, and, as the story says, 'have lived happily ever since'—happy because I found at Lathom a soil that with good cultivation will grow most things fairly well, and because I found most kind and appreciative employers, who were ever ready to recognise and give a word of praise for whatever is good upon their table, whether fruit, vegetables or flowers.

"Of all vegetables the one perhaps that I cultivate best is the Potato, of which I grow every year about fifty varieties, and for which I have won many prizes, including the Silver Cup (of which I own two) of the Liverpool District Farmers' Club show, which has perhaps the finest Potato show in the country."

MR. W. L. BASTIN.

Mr. W. L. Bastin, gr. to Sir Alex. Henderson, Bart., Buscot Park, Berkshire, is well known as an exhibitor of kitchen-garden crops and fruit. The particular difficulty with which he has to contend is due to the soil of the garden being of a very heavy nature, and resting on a subsoil of clay. He says :—

"I have had the privilege of serving in good all-round gardens since I was fifteen years old. My aim has been to become a good practical and theoretical gardener. I have gained my experience as journeyman and foreman at Preston Hall, Maidstone, Kent; Swyncombe Park, Henley-on-Thames; Haydon Hall, Eastcote, Middlesex; Fetcham Park, Leatherhead, Surrey; and Ashgrove, Sevenoaks, Kent. For some years I was gardener to Admiral Pringle, Digswell, Hertfordshire; and I left that place to take charge of the gardens of Sir Alex. Henderson, Bart., M.P., Buscot Park, in 1897. These are good gardens, and we have a great demand for fruit and vegetables. I have also given some attention to the growing of vegetables for exhibition at the principal shows—London, Shrewsbury, Wolverhampton, Bristol, Cardiff, and Reading—where I have won gold and silver medals and numerous other prizes; also Silver Cup and other high honours at the Temple for fruit and vegetables. I was awarded a Silver Knightian Medal by the deputation from the Royal Horticultural Society in July, 1903, at Cardiff, for a collection of six varieties of vegetables, which I was told was an unusual distinction to be awarded a collection of only six varieties."

MR. NORMAN DAVIS,

although specially well known as a first-rate cultivator of Chrysanthemums, has distinguished himself also in the growing of culinary Peas under glass for consumption in the month of May, being the only cultivator nearer than the Channel Isles who has grown such a crop in anything like the quantity (see *Gardeners' Chronicle*, June 13, 1903, p. 369). He says :—

"I was born at Brixton in 1850, which at that time was principally inhabited by City merchants, and horticulture flourished. My father and grandfather were merchants and keen gardeners, and my love for gardening was inherited. Before I could be started in life misfortunes had overtaken us, and on leaving school at the age of fourteen I had little to depend upon but my own energies. I was, however, placed with an uncle, also a City merchant, where I remained some twenty years, gaining considerable experience in commercial life. Then, upon losing my mother, the home was entirely broken up, and I found myself in lodgings at Walworth; and it was here that my fate as a Chrysanthemum grower was decided. My landlord was a keen amateur 'Mummist,' exhibiting in his small way at the local shows; and it was not long before I was as keen as he. I spent in his garden much of my spare time, and together we often visited the then far-famed Temple Gardens, as well as such nurseries as those of Messrs. Salter, Adam, and Forsyth, bringing home cuttings or plants of the novelties. Upon marrying in 1872 I found more scope for the practice of my hobby, but my sympathies were not confined to Chrysanthemums. I have reared collections of many kinds of florists' flowers. Finding gardening expensive and beyond my means, I started as many others have done, and made my hobby pay for itself; and finally left City life and started as a professional grower. My success as a Chrysanthemum grower, however, is not the interest of the moment.

"After 1890, finding competition growing keener every year, I decided upon extending my business, and came to Framfield, in Sussex, in 1896. I tried market gardening under glass; scarcity of skilled labour in country districts rendered progress slower than I wished, but I think I can fairly say I have turned out various crops with some amount of success. Strawberries (these without heat), French Beans, and Tomatos, all paid well, and always will do, so long as they are well grown and properly marketed. My chief success, however, and what has proved most interesting to me, has been the growing of culinary Peas under glass for marketing in May; these I have grown for six years in succession, and no crop has paid me better: I have been able to

*

Gard. Chron., 1876

Obituary.

We regret to announce the death, after a short illness, of Mr. George Austen, of Tresco Farm, Isles of Scilly. The deceased was a native of Staffordshire, and served his time in the gardens of Sandon Hall, the seat of the Earl of Harrowby. After leaving Sandon he was for several years foreman under Mr. Davidson, of Stackpole Court Gardens, Pembrokeshire, the seat of the Earl of Cawdor. After a temporary residence in the Messrs. Osborn's nursery at Fulham, he was appointed gardener to the then Lord Barrington, at Beckett Park, which situation he held for eight years. From thence he went to live with Mr. Biddulph, banker, of Ledbury, and on his death went to the Rev. T. Phillpotts, of Porthgwidden, Cornwall, in whose service he remained as gardener and bailiff for over twenty years. Six years ago he entered the service of the late Augustus Smith, Esq., Lord Proprietor of the Scilly Isles, as manager of the farm and estate of Tresco, and he continued in the service of the present proprietor, Dorrien Smith, Esq., up to the time of his decease. Mr. Austen was an excellent practical gardener, and famous as a first-class Melon and Cucumber grower. He was the introducer of that excellent Melon called after him, "Austen's Incomparable." The garden at Porthgwidden during his long superintendence, and under the encouragement and friendly help given him by his employer, became one of the most noted in the West of England. His genial disposition, integrity of character, general intelligence, and wide information on subjects of natural history, gained for him the esteem and respect of a large circle of friends, who will learn of his death with sincere regret. He leaves a widow to mourn her loss, and two sons, the younger of whom, Mr. John Austen, late of Blenheim, is now head gardener to Sir Greville Smyth, Ashton Court.

Liverpool by Thomas Aughton of Southport Grocer the Son and John Whittle of Birkdale in the said County Sergeant of Police the Executors.

AUGUST James.
Effects under £100.

12 July. The Will of James August late of Beddington in the County of **Surrey** Gardener who died 4 June 1877 at Beddington was proved at the **Principal Registry** by Mary Ann August of Beddington Widow the Relict the sole Executrix.

AUGUST James.
Effects under £100.

23 October. The Will of James August late of High Town Foul Ford near Ringwood in the County of **Southampton** Yeoman who died 18 June 1877 at High Town was proved at **Winchester** by Elizabeth August of High Town Widow the Relict the sole Executrix.

AULD William.

24 April. The Confirmation of the Commissariot of **Edinburgh** dated 23 March 1877 of William Robert Livingstone Auld Boot and Shoe Maker 381 High-street Edinburgh the Son as accepting Executor Nominate of William Auld Boot and Shoe Maker 381 High-street Edinburgh residing at 2 Meadow-place Edinburgh who died at Edinburgh 14 February 1877.

AULT Henry Horatio.
Effects under £50.

5 October. Administration of the effects of Henry Horatio Ault late of 202 New-crane Wapping in the County of **Middlesex** Engineer who died 1 July 1876 at 202 New-crane was granted at the **Principal Registry** to Jemima Ault of New-street Barking in the County of Essex Widow the Relict.

AUST Thomas.
Effects under £200.

5 October. The Will of Thomas Aust late of Ditteridge in the County of **Wilts** Labourer who died 9 August 1877 at Box in the said County was proved at **Salisbury** by Thomas Randall and John Hall both of Box Innkeepers the Executors.

AUSTEN Alfred.
Effects under £1,500.

2 October. The Will of Alfred Austen formerly of Guildford in the County of Surrey but late of 29 St. James-street Brighton in the County of **Sussex** Grocer who died 20 July 1877 at 31 King's-road Brighton was proved at the **Principal Registry** by Sarah Martin Austen Austen of 29 St. James-street Widow the Relict the sole Executrix.

AUSTEN George.
Effects under £200.

14 February. Administration of the effects of George Austen late of Tresco one of the Islands of Scilly in the County of **Cornwall** Farm Bailiff who died 20 October 1876 at Tresco was granted at the **Principal Registry** to Maria Austen of Gulval in the said County Widow the Relict.

AUSTEN John.
Effects under £800.

20 March. The Will of John Austen late of Tenterden in the County of **Kent** Farmer who died 18 January 1877 at Tenterden was proved at the **Principal Registry** by Ann Austen Widow the Relict and John Austen Yeoman the Son both of Tenterden and Henry Austen of 41 Ludgate-hill in the City of London Grocer the Son the Executors.

The Gardens of Viscount Elveden, M.P.,

AT PYRFORD COURT, WOKING.

Interview with Mr. W. Auton.

THE annual dinner of that excellent institution, the Royal Gardeners' Orphan Fund, was this year presided over by the Right Hon. Viscount Elveden, M.P., formerly known as the Hon. Rupert Guinness. Both he and the Viscountess, who accompanied him, made eloquent speeches on behalf of the objects of the Fund, in the course of which they gave clear indications of an enthusiasm for gardening, while their practical sympathy was shown when the subscription list was read out, his lordship heading it with a donation of one hundred pounds, and the Viscountess following with fifty pounds. During the reading of this list an interesting statement was made by Mr. B. Wynne, the secretary. He had come to the name of Mr. William Auton, and explained that Mr. Auton was head gardener to Viscount Elveden, and the previous season had obtained permission to throw open the gardens at Pyrford Court to the public, making, on behalf of the R.G.O.F., a small charge for admission. That the public greatly appreciated the opportunity thus afforded them was evident, for the Fund benefited to the extent of nearly thirty-one pounds.

But few of those who visited the gardens, and saw them in their beauty, could have had an idea of the amount of work involved in their making, nor of the vast transformation that has been wrought since Viscount Elveden bought the land fourteen years ago. Indeed, as Mr. Auton showed me round, towards the end of July, and pointed out some of the principal features, it was difficult to realise that previously much of the vegetation was merely scrub.

Pyrford Court is midway between Byfleet and Woking, and close to Pyrford Common. The estate is about a thousand acres in extent, and the pleasure grounds comprise between forty and fifty acres.

"Except for the trees," said Mr. Auton, "everything has been made, and the gardens planted, since 1907."

"Was that when you came here?" I asked.

SYNTHETIC MANURING.

"No; I did not come till 1912, and developments had already started, though some of the features, such as the rock garden, have been made under my supervision. But at the outset I must explain that I am not now the head gardener, though I still act in an advisory capacity. Lord Elveden is keenly interested in the problem of supplying manure to the land, in view of the shortage of farmyard manure, and for some time I have been making experiments in synthetic manuring—the treatment of vegetable refuse of every sort—with a view to its use as an efficient substitute for animal manures. Much of this, at present, is laboratory work, in which I had had training. Until our experiments and trials are fully completed, which may take two or three years yet, we do not want to publish the details of our processes; but I can tell you the results so far justify me in saying that not a scrap of vegetable refuse—leaves, twigs, and even branches—need be burned, for all can be converted into valuable manure. You will be able to see some of the results for yourself as we go round. The work requires constant attention, so Lord Elveden kindly relieved me of the active duties attached to the gardens, so that I can devote more time to this problem of synthetic manures."

"Apart from the laboratory, there is, of course, much outside work?"

GAS FROM VEGETABLE REFUSE.

"Yes; field trials are carried out on a large scale. We have, I may say, so far succeeded that we are practically independent of farmyard manure, the synthetic manure and chemicals supplying all the needs of the soil. In the course of our experiments we have been able to utilise a by-product of decaying vegetation, marsh gas. Will-o'-the-wisp, as you know, is caused by this gas; and in the process of treating the materials we have been able to collect it into a retort, and produce a gas of excellent quality, equal, in fact, to coal gas. Here you can see it for yourself."

Mr. Auton then took me into a large shed, close to the structure where the refuse is treated. Nearby is a retort, and pipes from this are laid on in the usual manner. The gas was lit, and both as an illuminant and for heating purposes it seemed in every way as good as, if not better, than coal gas, and I was told that Mr. Auton's house would shortly be connected up, as a beginning; while it is believed that sufficient can be generated for all domestic purposes on the estate. The commercial possibilities thus opened up are of vast importance, but as the experimental stage is not yet passed, Mr. Auton did not care to commit himself by forecasting future developments. "Besides," he remarked, as we came out, "I must not detain you by talking too much of the scientific side, or you will have no time to look at the gardens. The rock garden is near by, so we will commence with that."

THE NYMPHÆA GARDEN AT PYRFORD COURT.

A LARGE ROCK GARDEN.

This rock garden is on a large scale, in keeping with the others. Advantage has been taken of the natural slope of the ground—for the house stands on the crown of a hill, with an extensive lawn in front, and the various gardens around it—but it has been considerably deepened, and all the surplus soil, together with that taken away in levelling the other gardens, some thousands of tons, was used to make a big embankment, which shuts off the rockery, and is planted with shrubs. This work was done in 1914, when the rockery was made, and the shrubs have now attained a large size. At the foot of the rockery is a bog garden, the water spreading out from a pool, which is fed by a waterfall. At the time of my visit the pool was dry, owing to the abnormal season; but ordinarily it is fed by the surface drainage which is collected higher up, and goes into a soft water tank, whence an electric motor pumps it into the Lily pond, and from this it finds its way to the rock garden. There is also a moraine here.

As to the plants, they comprised all the usual run of Alpines and rock plants, but I noted an especially large area devoted to Primulas, while some handsome Bamboos were very attractive. There are but a few kinds, the principal being Bambusa Metake, B. nitida, and Phyllotachys fastuosa, but these are in liberal clumps.

"The outbreak of war came when we were still working on this rockery," said Mr. Auton; "but we are now taking it up again. In fact, the gardens are not yet completed, and much remains to be done, as opportunity permits."

THE NYMPHÆA GARDEN.

The winding steps of the rockery lead up through tall trees to the Nymphæa garden, so called from the Water Lilies in the pond in the centre. They are some of the choicest varieties, and on this glorious summer day made a delightful picture. At each corner of the pond is an example of topiary work, two spirals and two birds; and a broad, flagged path runs round it. At one end the trees which top the rockery make a cool and shady background, while all around runs a well-kept hedge of Holly. Parallel with the pond on either side is a long bed of Cannas, and at each end are two beds of Carnations, which were blooming well, thanks to a good mulching of the synthetic manure. In the shaded border under the trees Funkias are established, and in front of these are beds of Ten-week Stocks. In the borders at the sides Wichuraiana Roses are planted and bent down; and other beds are filled with Ageratums. The Cannas, by the way, were raised from seed last year.

Passing through a gap in the hedge, we emerged on to the wide sweep of lawn fronting the mansion. Off to our left, Mr. Auton pointed out the Italian and Rose gardens, with the fountain and stone pergola; but we deferred our inspection of these, and crossed to the farther side of the house, where we entered a small shrubbery, devoted chiefly to Chinese shrubs, many of them new or rare. Here, too, are borders filled with all kinds of medicinal plants, and beds with culinary herbs. Connecting them are arches covered with climbing Roses.

And now we came to another large garden, paved with red brick on edges.

"This," said Mr. Auton, "we usually call the Tank Garden, from the three tanks, level with the path, and filled with Water Lilies. It is really a summer garden, where we stand

tub plants, such as Hydrangeas, Agapanthus, and Fuchsias, which are rather a feature here. The borders and beds are filled with summer-flowering herbaceous plants."

GARDENS FOR SPECIAL EFFECTS.

"Have you, then, special gardens for special seasons?"

"Yes; and also to give special effects. For instance, we have a spring garden, and a grey garden, also blue, golden, and scarlet gardens, and, of course, Rose and Dutch gardens. Through this hedge of golden Cupressus macrocarpa we get to the June Garden, which is naturally now past its best."

The hedge, some eight feet high, is deserving of special mention, so bright was its golden foliage. As to the beds, they were filled mainly with Lupins, Pæonies, Aquilegias, and Irises, and only a belated blossom here and there lingered on to tell the tale of the loveliness which had been theirs. The Pinks which formed the edging were also done; but the Rose arbour in the centre was sufficient in itself to give interest to this garden.

However, we did not linger here, but passed on to the adjoining Spring Garden, where again the paths are paved with red bricks. Everything had long ceased to be effective, but from the broad masses of various species it was easy to conjure up a vision of the sheets of colour which had blazed forth three months earlier.

Still moving on, we now turned to the right, and soon came to a long and solidly made pergola, which seemed to run paralled with the gardens we had just looked at. Underneath, the path is of terra-cotta and white bricks; and Roses festooned the posts and arches.

"We had to renew all these poles last year," Mr. Auton explained. "The pergola was made and planted in 1914, when Larch was used, but it does not last well, and now we have substituted Scotch Fir, which has a longer life. The broad borders on each side, which you see are filled with Irises, contain only one variety, Kharput, and when it is in bloom the many thousands of dark blue flowers look well against the coloured tiles of the path and the green foliage of the trees."

BORDERS OF ONE COLOUR.

Another sharp turn, this time to the left, brought into view a very long grass path, with broad borders on each side, divided into sections by tall hedges.

"These, I presume, are borders planted to colour?" I remarked.

"Yes; we carry out in each a separate colour scheme. In this first one the plants present white, or cream, or pale yellow or dull green, some by their foliage, some by their flowers. Funkias give us silver and creamy variegation; Spiræas, Veronica Traversii, Skimmia japonica, and other shrubs and herbaceous plants are employed. The next division is the Blue Garden, and for this we rely largely on Delphiniums, Anchusas, bush Clematis, Eryngium Oliverianum, other Funkias, Lupins, and Campanulas."

"The golden border, which comes next, is very striking now."

"It is especially designed for summer and winter effect. The two we have just looked at are not so good just now, because the drought has dealt severely with them. For this golden garden we have, as you see, a backing of trees on each side, and they, too, by their foliage help in the scheme. There are golden-leaved Catalpas, and many Conifers of similar colouring. In the bed itself, besides the golden perennials, such as Sunflowers, Helenium pumilium, Rudbeckias, Anthemis, and others, to say nothing of Dahlias, we have Holly, Yew, and Privet of the golden-leaved species."

"And this next garden also has its framework of trees!"

"This we call the Grey Garden, and the trees outside are planted for their grey foliage—such as the grey Poplar. Thuya Triomphe de Boskoop is a beautiful Conifer with grey foliage: and among the plants are the Globe Thistle, Cotton Lavender, Gypsophila, Nepeta Mussini, and Carnations and Pinks. In the next, the Scarlet Garden, the Canadian Maples outside give us deep, rich colours in autumn, and there is plenty of variety in the plants. Dahlias will be fine; and the Red Hot Pokers, Lychnis, Zinnias, Antirrhinums, French Marigolds, and others are vivid. You see we make good use, too, of the Dwarf Nasturtium, and here is a most brilliant little plant, Verbena chamædryoides, which is a perfect gem, both for carpeting the ground and for the rockery."

Here a turn in the path brought us to the kitchen garden, divided into four by two pergolas which cross at right angles. All told, there are five hundred and sixty trees, part Apples, the rest Pears. The best of the Apples, I was told, are Allington Pippin, Cox's Orange Pippin, Golden Spire, King of the Pippins, Charles Ross, Lord Hindlip, Blenheim Orange, and Ribston Pippin, all of which thrive on this very thin soil.

DAFFODILS IN THOUSANDS.

At the end of the kitchen garden we again struck the path leading to the summer garden, and from this we turned off beneath the trees, and got to the wild garden. This is practically the only part that was in existence when Lord Elveden bought the place, and it contains a number of fine trees. Through a charming dell, cool and soothing in its shade by contrast with the fierce summer sun outside, we went down a bank clothed with Ferns of many species.

"In the spring," said Mr. Auton, "this presents a wonderful sight, for everywhere Daffodils are nodding their heads. In one year we planted as many as a hundred thousand. Then the Bluebells are numerous, and other bulbs are likewise in quantity, as well as Lilies of the Valley, Megaseas, and other spring flowers, so that we have great sheets of colour. Bluebells are planted beneath this archway of Nut trees which we are now under."

The walk through the wood had been very pleasant, the path winding for about three-quarters of a mile; but presently, after crossing a wooden bridge, we came out into the open again, with a glorious view stretching away to the south and south-west. We were on the brow of a hill, and a wide expanse of country lay before us. Evidence of the effects of the drought were apparent, however, in the parched herbage; while near at hand a large plantation of Rhododendron ponticum, made last year, was already dead for lack of moisture. The field sloping away to our right will later—when rain makes the work possible—be planted with Delphiniums and Lupins, making a vast bank of blue in various shades.

A BEAUTIFUL LAKE.

Descending the hill, and crossing another field, we reach the lake, one of the outstanding features of Pyrford Court. It is a sheet of water about five acres in extent; but its great charm consists in the moisture-loving plants on the island in the middle, the acre and a half of Japanese and Siberian Irises on one side, and the different colours of foliage and bark carried by the trees on its bank. A clear view is obtained from the mansion, a mile and a half away, and the planting throughout has had this as its object. The water this summer has been at a very low level, and the bed was almost dry when I saw it.

"All the Irises here are from seed," Mr. Auton explained. "Two years ago the space they now occupy was practically waste, for though Irises had been planted some years before, they seemed to have died out. So I had the ground dug over, and it was then that I found, coming up among the dead roots, a great number of seedlings. These were carefully saved and put on one side, and replanted with the others when the ground had been trenched. This year they flowered magnificently."

THE SUMMER GARDEN AT PYRFORD COURT.

"What scheme do you follow in planting the banks?"

"The idea is to get gold, crimson, and other tints intermingled with shades of green, to afford distinct patches of colour visible from the house, especially in winter, when, of course, we must rely chiefly on different coloured barks. All that you see here have been planted since 1909, and among them are Willows, Poplars, Abies Douglasi, Acers, Beech, and Ash. Some were planted in 1911, others in 1914, and a lot in 1916 by lady gardeners, after the ground had been trenched by Belgian refugees."

"But will not some of the trees in time grow so much as to make it impossible to see the full effect from the mansion?"

"To keep them in bounds they are planted in batches, and in alternate years we go round and take some of them out. Liquidambars form one group, and they look very fine against the dark foliage of Prunus Pissardii, planted near them. Canadian Maples in another group provide good colours, and American Oaks, Willows, Golden Privet, Sedges, Abies, and other suitable subjects are made to serve."

Walking round the lake, I was able to judge of the beautiful effect produced, the moderate-growing subjects on the margin, and across the

path taller bushes, but each kind so planted as to throw into relief the colours of its immediate neighbours.

SOIL CULTIVATION OVERCOMES DROUGHT.

Before retracing our steps to the pleasure grounds we spent a few moments at the new kitchen garden—formed two years ago—some two acres in extent; and noticing how light the soil was, I asked how the crops fared.

"Six inches down is almost pure sand," said Mr. Auton; "and the subsoil is iron-pan. But for all that, we get good crops."

"Are you able to give them any water?"

"No; for the sufficient reason that we have none."

"Then how do you account for the good results?"

"The soil is well cultivated, and we give it a dressing of the synthetic manure. In trenching, we do not keep the top spit on top, but bring the subsoil to the surface, where we have more control over it, and can work it and improve it. Drought is, of course, bad for crops, but poor cultivation is worse, and in a dry season the man who cultivates insufficiently is found out."

Long rows of thriving Broccoli and Brussels Sprouts, Carrots, Seakale (planted in March and April), and other crops bore out Mr. Auton's words; while as to the nature of the soil, it was dry, and as fine as powder on the surface, though a few inches down it improved.

In returning, we halted at a series of plots where the synthetic manure was under trial. The appearance of the crops was all in its favour, when compared with the control and other plots. But there was still much to see in the gardens, so we hastened forward, and got back to the principal lawn, where are to be found the Dutch, Italian, and Rose gardens. These are in sight of the house, though on the far side of the lawn. A handsome pergola in the Italian style runs along the south and west, forming a V-shaped angle, with its apex near the gate of the Well Garden.

ROSES ON LIGHT SOIL.

Bounded by one side of the pergola is the larger of the Rose gardens. Here a long border of dwarf Roses, in groups of separate varieties, defied the drought. The surface had been heavily mulched with the prepared vegetable manure—this being, I was told, the only treatment the hungry, sandy soil had received. Among the varieties I noted as highly satisfactory were Lady Roberts (T.), Betty Berkeley (C.), Souvenir de Catharine Guillot (T.), Papa Gontier (H.T.), Lady Battersea (H.T.), G. Nabonnand (T.), Viscountess Folkestone (H.T.), Notting (T.), Comtesse du Cayla (C.), Cramoise Supérieure (C.). It will be observed that the Tea and China sections are well represented, and in addition two other China Roses, Laurette Messimy and Madame Eugene Resal, were used to fill large beds. Groups of five pillar Roses connected at the top with chains, in square beds cut in the grass, relieved the garden from the appearance of flatness.

In the angle of the pergola is the Italian garden, with its handsome fountain. Four beds here, cut in the grass, are filled with that always satisfactory variety, Caroline Testout, carrying out a scheme in pink.

Roses of the Wichuraiana section, ornamental Vines, and Clematis cover the arms of the pergola, with tuberous Begonias at the base of each stone pillar.

On the south side, through the pergola, another Rose garden has beds—one variety in each—of Madame Ravary, Madame E. Herriot, Lady Hillingdon, and Mrs. Wemyss Quin, and Hybrid Perpetuals, and Mr. Auton drew my attention particularly to a large bed of Fellenberg, pegged down, and another of Zéphirine Drouhin.

AN ITALIAN PERGOLA AT PYRFORD COURT.

"These," he said, "are two of the best Roses I know of for flowering freely over a long time."

The Well garden, so called from the ancient well-head in the centre, is enclosed by a Yew hedge, and is paved with broken flags, between which Thyme is planted. This is a garden of fragrance, for of the eight beds four were filled with Heliotrope, dotted with standard plants, the other four with scented Geraniums and Tobacco Plants.

Heliotropes also figure largely in the Dutch garden, which, too, is bounded by a Yew hedge, and has some good examples of topiary work.

There is very little glass, and this is used to bring on a few plants for the house. Peaches and Plums are grown on the wall outside, and excellent crops were carried, the Plums being Early Rivers, Orleans, Victoria, and Diamond; the Peaches Early York, Royal George, and Noblesse; and the Nectarines, Lord Napier and Early Orange.

Many other features of interest were to be seen, but time was pressing, and I had to resist the temptation to stop and examine them; but as I was coming away the south wall extending beyond the pergola, and in full view of the house, compelled attention. Here, in the border, were more separate colour blocks; while on the wall itself were many rare shrubs, some of which are reputedly not hardy, but all, from their size and healthy appearance, were obviously suited by the situation.

Akebia quinata was growing rampantly; Punicea Granatum, the Pomegranate, was bearing several fruits; and Mr. Auton pointed out a Greville sulphurea, nine feet high and five feet wide; G. rosmarinifolia, still larger; Diospyrus Kaki, ten feet by twelve; Carpenteria californica, six feet by nine; and Chimonanthus fragrans, eight feet by ten.

How beautiful these gardens will ultimately become when they reach their full development can perhaps be left to the imagination. Meanwhile Viscount Elveden is doing a good work in encouraging investigations into the best methods of treating vegetable manures, a work Mr. Auton has taken up with enthusiasm, and for which his training at Kew has proved helpful.

W. J. Chittenden.

The Fruit Garden.

VARIETIES OF APPLES.

Now that the planting season is at hand, considerable interest will be taken in the choice of varieties of fruit trees. An examination of any catalogue will reveal long lists of Apples, described at varying length, but such descriptions are frequently of little use to the amateur requiring only two or three trees. There are, however, several general points, which are worth considering before selecting any particular variety.

POINTS FOR CONSIDERATION.

In the first place, the cropping powers of a tree should be known; for instance, some Apples bear young and heavily, whilst others may scarcely crop before their tenth year. A second point is to ascertain their mode of bearing. The majority bear fruit, or can be made to do so, upon spurs, but a few varieties fruit consistently at the tips of the young laterals, and, if they form spurs at all, do so with great diffidence. Obviously, such trees need a different method of pruning from the spur-bearers, if fruit is to be got. Thirdly, some varieties are much more subject to disease than others; so much so, indeed, that it is not always possible to grow some Apples for this reason.

With these ideas in mind, it will be realised that practical considerations should enter largely into the choice of Apples, and both defects and merits should be taken into account. It is now possible to make a few suggestions with regard to certain varieties, and it is hoped these will be of assistance not only in relation to the Apples mentioned, but also by suggesting queries to be answered in respect of other varieties.

DESSERT VARIETIES.

Starting with dessert Apples, Cox's Orange Pippin heads the list from the point of view of flavour. Every gardener should try this Apple, in spite of the fact that it is very subject to canker and mildew. This is a variety which repays when grown as a cordon; in fact, owing to its proneness to disease, the cordon gives more satisfaction because fruit comes quickly, and good returns should result during the early years, to repay any set-back that may be caused later by disease. The fruit keeps from October until December, and is of a better flavour if allowed a little time to mature after picking.

James Grieve is another variety that bears well on cordons, but may also be grown very successfully as a bush. Canker and scab often attack it badly, but it compensates by its heavy cropping powers. It is a delicious Apple when ripe, and well worth growing, especially as it seems probable that it will cease to be a first-class market fruit, owing to its tender skin, and the ease with which it bruises. Handled carefully at home, however, it is one of the most attractive dessert Apples at the present time.

Lector.

(To be continued.)

THE GARDENS AT FINSTALL PARK, BROMSGROVE.

THE glimpse which the observant traveller catches of Finstall Park, as the train rushes through Bromsgrove on its way from Bristol to Birmingham, is sufficient to awaken interest; but the gardens surrounding the residence of Mr. J. B. Brooks, in near proximity to the pleasant Worcestershire town, are far prettier than most people giving the place a cursory glance would imagine. Visiting them on a delightful day towards the close of the lovely summer, I was greatly impressed when I reached the south side of the house. Mr. Ernest Avery, who has charge of the gardens, first, however, pointed out objects of interest on our way, beginning with the carriage drive, with its avenue of Conifers. Here a conspicuous feature is an Elm stump, with Ivy growing over it. Near the house is a horse-shoe border, about a hundred yards long, with Portugal Laurels as a background, and Hydrangea hortensis, which, put out for a trial, have stood for three winters, and flowered abundantly without any protection.

"What was the summer bedding here?" I asked.

"Sweet William Pink Beauty, and Violas Cornuta Snowflake. For spring we are using Wallflower Blood-red and Cloth of Gold, with an edging of Pink Mrs. Sinkins."

"You have a fine and wonderfully green croquet lawn below the slopes?"

"Yes, it was remodelled nine years ago, and relaid last winter. As croquet is quite a hobby of Mr. Brooks, no pains are spared to keep the ground in the best possible order."

Antirrhinums for Four Months.

"What is the variety of Antirrhinum which makes still such a brave show in the border below the croquet lawn?"

"Webb's New Guinea Gold. They began to flower at the beginning of July, and do not cease until the end of October. This border is filled in spring with Wallflowers and Myosotis. The creepers on the house are Crimson Ramblers, Wistaria sinensis, and Ampelopsis Veitchii. The principal trees on the lawns are a fine Walnut, with a good crop of nuts; a Fir, feathered down to the ground, and stately old Oaks."

"How many beds are comprised in your formal scheme?"

"Nine. Two have been occupied all the summer with Geraniums Henry Jacoby, two with Harry Hieover, two with Flower of Spring, two with Happy Thoughts, and the centre with Mrs. Pollock. The centre bed was edged with Little Dandy, and the other eight with Lobelia Katherine Mallard. The whole of these beds in spring will consist of Wallflowers—the two varieties mentioned—except the centre, in which we plant Eastern Queen."

"The Geraniums appear to thrive in their quarters?"

"They have done remarkably well. We double dig the ground, and put in plenty of manure at the bottom. The roots have gone down to the manure. We have not had to give them any water. They started flowering on June 15th, and last until October. Geraniums, of course, like a dry season."

Continuous Blooms.

"I notice that there are Roses planted out in the conservatory."

"Niphetos and Gloire de Dijon, which give us blooms all the year round. Bougainvillea glabra is also planted out, and on the stage are Begonias (double and single), Coleus, Geraniums, Fuchsias, and Asparagus Sprengerii, chiefly grown from seeds."

"And all looking well."

At this point we turned our attention to the south front, of which a singularly pretty view is obtained from the house windows, embracing several specimen Piceas, Beeches, and Hollies; a very handsome and novel arbour made of wood; and a great stretch of velvet sward. Below the Piceas is a path with a rockery running right along.

"There are not many varieties yet in the rockery," said Mr. Avery, "but the Rosery below, which was replanted two years ago, contains over a hundred varieties. Previous to planting, the beds were dug two feet deep, and we worked in good cow manure. There are five long beds, three filled with Hybrid Teas, one with Teas, and one with Hybrid Perpetuals—all mixed, but each variety represented by about half a dozen plants in a group. Every variety is labelled."

MR. ERNEST AVERY.

"How long do you expect the plants to flower?"

"Seven years. Some might go on for fourteen years, but others deteriorate."

Favourite Roses.

"You might give me the names of some of the best Hybrid Teas."

"The Countess of Ilchester, Liberty, Dorothy Page Roberts, Dr. O'Donel Browne, Lady Alice Stanley, Lady Helen Vincent, Lady Ashtown, Betty, Lyon Rose, Mrs. David Jardine, Mrs. E. J. Holland, Mrs. James Craig, Mrs. Harold Brocklebank, Queen of Spain, and Mrs. A. R. Waddell. The Teas include Anna Olivier, Lady Roberts, Mrs. Dudley Cross, Empress Alexandra of Russia, Molly Sharman Crawford, and Ernest Metz; and the Hybrid Perpetuals, Frau Karl Druschki, Her Majesty, Countess of Oxford, Hugh Dickson, Madame Eugenie Verdier, and Victor Verdier. We gather Roses here until November."

"Then there is the border with more Antirrhinums?"

"The variety is Webb's Challenge, and Cliveden Yellow Pansies edging them. In spring we use Narcissus, Golden Spur, Barrii conspicuus, Pheasant-eye, and the double Daffodil, Von Sion. Narcissi in variety are naturalised on the lawn."

Annuals in the Fruit Walk.

With a glance at an asphalte tennis court, (which, unlike some, is used), a nice archway of Yews, and a typical Oak overhanging the walls, we made our way to the kitchen garden—a series of kitchen gardens. These are on a considerable scale, and the garden walk along one side of the principal block is quite picturesque.

"In the border on each side of the walk," continued Mr. Avery, "annuals and other flowers are grown under the fruit trees, for decorative work in the house. At the bottom of the border, still under the fruit trees, are Violets, The Czar, while beyond is a bed of Sweet Williams, and further on a collection of Ferns. The most notable annuals are the Shirley Poppy, Double White, White Swan, and Meteor; Asters, Ostrich Plume, Victoria, Giant Comet, and Snowflake; ornamental Grasses, Eragrostis elegans, and Agrostis nebulosa, which we use without flowers in the vases; and Stocks, New Admiration, Imperial Ten-weekly Snowdrift, and Intermediate large-flowering Perpetual Emperor. The herbaceous portion has at the back Michaelmas Daisies in variety, and Anemone japonica alba and rosea; towards the front we put in three rows of Canterbury Bells, rose, white, and blue, with an edging of London Pride."

"Are your Sweet Peas in this locality?"

"Yes, and we grow them in rows, of which the best are Maud Holmes, The King, Primrose Spencer, White Spencer, Miriam Beaver, King Edward Spencer, Apple Blossom Spencer, Helen Lewis, Etta Dyke, Countess Spencer, Paradise Ivory, and Masterpiece."

The Best Pears and Apples.

"Your fruit trees seem to be in prime condition."

"The crop of Pears this year is better even than that of Apples, which I know is not the usual experience. The Plum crop has also been good. The trees are chiefly Pears, and we have some fruit of excellent quality."

"Which do you consider the most valuable varieties?"

"Pitmaston Duchess is one, and others include Williams's Bon Chretien, Le Lectier, Beurre Hardy, Doyenne du Comice, Louise Bonne de Jersey, and Triumphe de Vienne. The best Apples are Cox's Orange Pippin, Princess Pippin, King of the Pippins, Worcester Pearmain, Bramley's Seedling, Ecklinville Seedling, Cellini Pippin, Lord Grosvenor, and Pott's Seedling. We do not go in for a number of varieties, but prefer to grow a quantity of those which we know can be depended upon. They are all bushes and pyramids. With regard to other fruit, there is nothing extraordinary, but some of the vegetables may deserve mention."

"The Tomatoes, for instance?"

Outdoor Tomatoes.

"Yes, they are doing well outside this year. The varieties are Carters' Sunrise, Webb's Emperor, and Jubilee. I have had one fruit of Jubilee weighing a pound. The crops of vegetables are generally satisfactory. I get out trenches for Peas in the same way as Celery, and put in plenty of good manure in the bottom of the trench. In consequence, they stand the drought much better."

"What varieties of Peas do you grow?"

"Kinver Gem, for first early; and we follow

Digitized by Google Original from CORNELL UNIVERSITY

on with Pioneer, Gradus, New Model, Stourbridge Marrow, New Kaiser, Senator, Duke of Albany, and for late use Masterpiece and Gladstone. Eight rows are devoted to Celery, the varieties being Pink Perfection, Mammoth Red, Aldenham Prize Pink, and Giant White."

"You go in extensively for Vegetable Marrows?"

"Which we grow on a bed of manure, the varieties being Large Cream, Large Green, Large White, Pen-y-byd, and Custard. The Runner Beans are Scarlet Emperor and Exhibition."

The Cultivation of Onions.

"You must not dismiss your Onions too summarily, for they deserve special attention."

"The ground was dug at least two feet deep, and plenty of good manure worked in. I sow the seed towards the end of January or early in February, in a temperature of about fifty-five or sixty degrees. I prick off into boxes when large enough to handle, and grow on till about the beginning of April, then gradually harden them off, and finally plant out about the end of April or early in May. Previous to planting, I give a dressing of soot, which I find is a sure preventive against the Onion maggot. The varieties are Ailsa Craig and Masterpiece. Onions have been grown on the same ground for seven years."

"Do you grow many varieties of Potatoes?"

"For earliest use Shape's Victor, and subsequently Express, Colonist, Wordsley Pride, King Edward VII., and new Guardian; and for the main crop, Up-to-date. Perhaps before you go into the houses you would like to say something about the Chrysanthemums."

"Yes; I see you have some outside."

"We only grow a few outside, but for inside use we have two hundred and fifty Japanese for big blooms, and a hundred and fifty Single and Decorative varieties. Two good varieties for flowering at Christmas and in January are Niveus and Nellie Pockett."

"How many houses are there altogether?"

"Half a score. The first is the Fernery, with Orchids—Cattleyas on the shelves. The Ferns are chiefly Adiantum cuneatum and Nephrolepis todeaoides. In the greenhouse there are Primulas, Exquisite and Rosy Morn, also Marguerites, and more Orchids, chiefly Cypripedium insigne, and C. Sedenis, and Cymbidium giganteum. In the stove are Caladiums and Dendrobiums in variety, and Strobilanthes Dyerianus. Other contents of the stove are Acalypha Clibranii, Anthurium Scherzerianum, Dieffenbachia Bausei, Ficus elastica, and Dracænas in variety, with an edging of Panicum variegatum."

"How do you manage to get such a fine show of Begonias?"

"I strike them, one each in a 'sixty'-size pot, using a compost of leaf-mould and sand. Subsequently I pot them on in ordinary loam, leaf-mould and sand. There are quite two hundred plants, and the varieties are Mrs. Leopold de Rothschild, Turnford Hall, The King, and Gloire de Lorraine. Many of the plants are two feet through."

A FINE BED OF ONIONS AT FINSTALL PARK.

"What are your favourite Grapes?"

"In the early Vinery we have Black Hamburgh. Madresfield Court, and Foster's Seedling. In the second, Muscats, Lady Downe's Seedling, and Gros Colmar; and in the late Vinery, Black Alicante and Gros Colmar."

"There remain the Peach houses, in one of which I see you have a few Chrysanthemums in flower."

THE ROSERY, FINSTALL PARK.

"The varieties of Peaches in the early house are Hale's Early and Early Alexander, and Rivers' Early Nectarine. In the second house only one Peach and one Nectarine are grown, namely Royal George and Elruge. We have not yet quite finished the houses. Here is one devoted to Tomatoes, in which the varieties grown outside all do well. We force a quantity of bulbs for decorative purposes. Some Daffodils I have already indicated, but in addition we have Golden Spur, Empress, and Sir Watkin. Some of the best Tulips are La Reine, White Swan, Yellow Prince, Murillo, Tournesol, Red and Yellow, and La Candeur."

"How long have you been in charge at Finstall Park gardens?"

"I came here twelve years ago, and was previously foreman at Lockesley Hall gardens, Romsey. Prior to that I was, for upwards of two years, in the gardens of the Empress Eugenie, at Farnborough Hill House, where I had charge of the decorations."

ALFRED WILCOX.

An interview with a famous amateur Rose-grower and exhibitor, the Rev. Henry Tower, M.V.O., Rector of Holy Trinity, Windsor, will appear next week.

RUSSET APPLES.

RUSSET Apples usually keep well, and by many persons are greatly appreciated when in a rather shrivelled condition. But if gathered at the right time—when properly ripened—and stored in a suitable room, kept cool and somewhat dry, with ample ventilation afforded them in mild weather, the fruits will not shrivel until quite late in the season—and the season for many varieties comes several weeks after Christmas, just at a time when Apples are scarce.

The trees of some of the varieties flower late, and thus escape injury from frosts. They are mostly moderate growers and prolific bearers, doing well as dwarf bushes and pyramids, if necessary, and also as standards. But for general utility in small gardens, the bush form is decidedly the best.

The fruits of only a few sorts are very large, the majority being from small to medium, and very useful for dessert, although they are superior, for cooking purposes, to some varieties that have softer flesh. Nearly all are richly aromatic, a few being exceedingly juicy and slightly acid. Altogether, I think that the Russet varieties are very good to grow in small gardens, and highly valuable for amateurs to cultivate for late supplies.

Boston Russet, Aromatic Russet, Claygate Pearmain, Cornish Aromatic, Cornish Gilliflower, Court of Wick, Court Pendu Plat, Cox's Pomona, Dutch Mignonne, Golden Russet, Hormead Pearmain, Lemon Pippin, Lord Burghley, Mannington's Pearmain, Pineapple Russet, Pitmaston Pineapple, Reinette de Canada, Royal Russet, Sturmer Pippin, and Wareham Russet—these are in season from November to May. Lemon Pippin keeps until the end of June.

DELAMERE.

THE GARDENS AT LOUDWATER HOUSE, RICKMANSWORTH.

Interview with Mr. Tom Avery.

ALTHOUGH I visited the gardens at Loudwater House in November under unfavourable climatic conditions, their beauties were very apparent. The charming residence of Mr. John Kerr is situated about three miles from Rickmansworth, in the heart of the hunting country, and the surrounding pleasure grounds are both extensive and varied. On my arrival, Mr. Avery, the gardener, whose name is well known in the horticultural world as a singularly successful exhibitor of vegetables, suggested that we should first inspect the features in the vicinity of the lake, on the south front of the mansion. The lake, which winds its way along for a considerable distance, and contains trout in abundance, is adorned, at intervals, by pretty rustic bridges—one of them decorated with Rambler Roses, which have made wonderful growth; its banks on the far side are enriched by flowering shrubs in variety, and the autumn tints of many trees merit mention; while on the near side Mr. Avery is about to commence a herbaceous border, which will be one hundred and twenty yards long, and eight feet wide. On the lawn is a sundial, which dates back many years, surrounded by lettering in Box. The inscription runs, "To give light to them that sit in darkness, and guide our feet into the way of peace."

Mr. Avery.
Head gardener at Loudwater House, Herts.

Terrace Spring Bedding.

"The spring bedding underneath the terrace," said Mr. Avery, "consists of four panels of Wallflowers, intermixed with the same number of Myosotis, edged with Polyanthus. The varieties of Wallflowers are Blood-red and Cloth of Gold; the Myosotis Royal Blue is much the best. In summer, for these beds, we use standard Fuchsia Mrs. Marshall, Geranium Paul Crampel as groundwork, and Ageratum as edging. The walls below the terrace are clothed with Ivies, Jasminum, Lonicera, Ampelopsis, Ceanothus, and Vitis purpurea."

"And the bedding on the terrace?"

"In spring, Polyanthus, Tulips Keizerskroon, Montresor, and Cottage Maid, and Myosotis; and in summer, Begonias and Coleus, edged with Lobelias Katherine Mallard, and Geraniums Little Dandy. The standard Roses on the terrace are chiefly W. A. Richardson, which have made wonderful growth."

"What is the nature of the soil?"

"It varies, marl, chalk, and flint alternating. You may like to note that the Marguerites, which you see are still in flower, though just affected by frost, are planted out in succession. We use them and the Ivy-leaved Geraniums for the vases in the summer; in the spring the vases are filled with Myosotis. The tubs which we dot about on the grass are filled with Hydrangea hortensis and Bays. The large bed at the corner is entirely a Rose bed, the varieties being Hermosa and Ferrand; they flower all through the summer, and are edged with Violas."

Chrysanthemums in Flower.

At this point we entered the fine conservatory, and I was confronted with a brilliant show of Chrysanthemums, many of the blooms being splendid. There is no staging, and the whole of the contents were in pots.

"Please point me out some of the favourite varieties amongst the masses of bloom," I said.

"Mrs. A. T. Miller, Henry Perkins, Reginald Vallis, Mrs. W. Etherington, F. S. Vallis, Mrs. W. Knox, N. C. S. Jubilee, Mrs. W. H. Lee, Evelyn Cardew, George Terry (rather unique), Robert Powell (a good bronze), C. H. Curtis, Godfrey's King, The Duchess, Madame Oberthur, and Edith Jameson."

"How many plants are there now in the conservatory?"

"Between one hundred and fifty and two hundred. This is the second instalment. We grow about three hundred of the large-flowering varieties, and three hundred bush plants. The Ferns (which are also used in hanging baskets) placed below them add to the effect."

"Unquestionably, and the foliage immensely. Both flowers and foliage are so good that I shall be glad if you can tell me briefly how you get them to such a pitch of excellence."

How they are Grown.

"We take all cuttings early in December, and pot four cuttings in a 'sixty' pot. The soil consists of equal parts of loam, leaf-soil, and sand. The pots are placed in boxes in a cool greenhouse on a stage, putting sheets of glass over them till they are rooted. Afterwards we pot them singly in small 'sixty' size pots. They are then placed in a frame, which is kept closed until they have started rooting again. Then a little air is given, and if the weather is favourable, it is increased. As soon as the pots become full of roots we pot on into large 'sixties,' and then again in 'thirty-twos.' The plants are next put into a span frame on a bed of ashes, plenty of air being allowed in fine weather. The advantage of having a span frame for Chrysanthemums is that a little air can always be introduced on the side opposite to that on which the wind is blowing. All this applies to all the varieties."

A Packet of Mixed Seeds.

"And the bush varieties?"

"The methods of cultivation are somewhat similar, only that we pinch them earlier. When the breaks are eight or nine inches long, we pinch them again, and, after the second break, we allow the plants to make a natural bud, which in most cases will be the terminal. At this new break they will be all flower-buds. I have also grown about eighty plants from a packet of Sutton's mixed seed, which are very fine, hardly two being of the same colour. This seed was sown at the end of February, and as soon as the plants changed leaves, they were potted on in the same manner as those grown from cuttings."

"Do you spray the plants regularly?"

"Through the season three or four times with a patent mildew compound, which we find very effective, while it does not injure the foliage. The fact that the conservatory is lighted only with the electric light, and has plenty of ventilation, helps to preserve the blooms."

Flowers for the Conservatory.

"How long do you continue to keep the Chrysanthemums flowering in the conservatory?"

"Well into the New Year. This month and December we have also in flower here Azalea mollis (retarded), Spiræa confusa, Coleus thrysoides, Tulip Duc van Thol (red and white), Roman Hyacinths, early-flowering Narcissi of sorts, and Primula obconica and stellata."

"It would be interesting to know how you proceed in the succeeding months."

"In February we have Cinerarias of the Covent Garden strain, Narcissi of sorts, Azaleas, Spiræas japonica and Queen Alexandra, Hyacinths and Tulips. Schizanthus and Clarkias Double Rose follow in March, with more Primulas, Hyacinths, and Tulips; also a few Lilacs, Staphylea colchica, and Guelder Roses. In April the contents are much the same, with Roses in pots in addition. When May comes, we bring in about a hundred herbaceous Calceolarias in 8-in. pots, which, with Hydrangeas and foliage plants, make a good show. In June, Liliums are to the front, more Schizanthus, and Achimenes. We grow the latter in baskets as well as pots. Malmaison Carnations join these

Digitized by Google Original from CORNELL UNIVERSITY

in July. We grow about two hundred of different varieties. In August the prevailing flowers are Liliums, Hydrangea paniculata, Ivy-leaved Geraniums in 8-in. pots, Fuchsias, and Campanula pyramidalis (white and blue). There is not much to attract in September, but towards the end of that month we begin with Chrysanthemums, and keep up a succession with Poinsettias at the end of the year. Mrs. Thompson is the latest Chrysanthemum."

Flowers Outside All the Year Round.

We next turned our attention to the north side of the mansion, where Crimson Rambler Roses on arches made a grand show, while Roses in front cover the area. But the feature here, facing the Hall, are the borders, one hundred and ten yards long, the top one eight feet wide, and the lower six feet. Ascending the steps up to the top border, I asked Mr. Avery to indicate the principal contents.

"The Acacia trees at the back are a great feature, and Acers and Prunus are conspicuous. There is a representative collection of Asters in clumps in the border, arranged according to height. Liliums tigrinum and giganteum, still in flower, throw out a large quantity of spikes. Then, we have Hollyhocks, which are not troubled by the pest; Helianthus, Solidago, Echinops, Pompone Dahlias, Chrysanthemum maximum, Honesty, Salvia patens, Violas in variety; clumps of Sweet Peas every ten yards; Antirrhinums; Nicotiana affinis and Sanderæ, Campanulas, and seedling Pentstemons."

Calceolaria mexicana.

"There are two good plants, with small yellow flowers."

"They are Calceolaria mexicana, of which I had a trial packet from the Royal Horticultural Society. The seed is sown in spring, and planted out as soon as the frost has done. The little golden Bays are rather pretty."

"Lilacs seem to be conspicuous in the lower border."

"Specimen trees of double-white Lilacs, creeping Mulberries, and Golden Yews are the feature; and the groundwork, which varies from season to season, is made to harmonise with the trees. In the season just over, we used Ivy-leaved Geraniums Charles Turner and Paul Crampel, edged with Pyrethrum Golden Feather, Geranium Little Dandy, Lobelias, and Ageratums. As standards in the border, which gives on to the tennis-court, are Roses Hiawatha, Crimson Rambler, and Dorothy Perkins. On the top terrace, above the wall, is a quantity of Ericas and Rock Roses, with a belt of Larch, Spruce, Beech, Limes, Chestnuts, and Copper Beech at the back."

"Do you spring-bed the borders?"

"There are flowers in them all the year round. Tulips are largely used in spring, the May-flowering varieties following the earlier. Wall-flowers are interspersed, and the whole are edged with Myosotis and Polyanthus."

Resuming our walk in the direction of the kitchen garden, we passed on the right of the lawn a bed with a quantity of Antirrhinums in flower, a small but excellent collection of rock plants, and a great wealth of Laurels under the trees. One of the charms of Loudwater is that there is no law of the Medes and Persians, so that you come across things quite unexpectedly. Proceeding along the banks of the lake, I observed close to the waterfall an Iris border, which is followed by the Russian Balsam, and Spiræas in variety. The Balsam seeds itself, and grows to a height of nearly ten feet.

"Also, you will notice," said Mr. Avery, "that the trunk of one old tree has climbing Roses, Hiawatha, on it, and another Caroline Testout; while further along the banks of the lake are a fine weeping Beech, Ferns in variety, and Polygonum. The rustic bridge we are now crossing brings us to an island, with a summer-house on it, and Cactus Dahlias still flowering profusely. The island was only planted two years ago."

"You must have a number of wild ducks hereabouts," I remarked, as we crossed another rustic bridge.

"We rear between three and four hundred. Here, Bamboos do splendidly. We are now approaching another piece of pleasure ground, which, however, has Plums and Pears on one side, and in the border Roses, Hermosa, with Wallflowers and Nasturtiums. The latter are also used for trailing over the fountain in the centre of the rockery, but the rockery itself does not at present contain many varieties. My bungalow, you see, is adjacent to this portion of the pleasure grounds, of which a number of

Loudwater House.

The Entrance to Loudwater House.

Waterside Gardens at Loudwater.

The Ornamental Water at Loudwater.

Digitized by Google Original from CORNELL UNIVERSITY

Rose pergolas is another feature. A bothy, with four bedrooms, is a recent addition."

Exhibition Potatoes.

We next arrived at a large field, planted with Potatoes and vegetables.

"This," continued Mr. Avery, "forms a part of the estate, which is about one hundred acres; and here, with most of the green vegetables, we grow our Potato crops, which, as you can judge for yourself, are very good this year. For early work we grow May Queen, Early Puritan, Ashleaf Kidney, followed by Duke of York and Windsor Castle. For the main crop we have Up-to-Date, Scottish Triumph, British Queen, Farmer's Friend, and Fleetwood Defiance. For show purposes, our Potatoes are King Edward, Sutton's Supreme, Satisfaction, Goldfinder, Windsor Castle, and Superlative. In contrast to the good crops of Potatoes is the absence of Nuts in the Nut walk. Last year we picked in this walk two sacks."

"What is the reason, do you think, that there are none this year?"

"I think the woodpeckers have taken a good many of them. You observe that intermingled with Nut trees are Acacias, which form a pleasing combination. Within sight of the stables are the plantations of Apples and Pears, grown on bushes. The Apples are chiefly Peasgood's Nonsuch, Cox's Orange Pippin, and Blenheim Orange. The best of the Pears are Pitmaston Duchess, Beurre Bosc, Beurre Diel, Louise Bonne of Jersey, and Williams's Bon Chretien."

The Rose Garden.

At this point we came suddenly to a sloping Rosery, of considerable dimensions, and I asked about the system on which they are arranged.

"There are upwards of two thousand plants in the Rose garden, all Hybrid Perpetuals and Hybrid Teas. The whole of them were lifted three years ago, the ground trenched, and the Roses replanted. The principal varieties are Alfred Colomb, A. K. Williams, Captain Hayward, Duke of Edinburgh, Frau Karl Druschki, Ulrich Brunner, Glory of Cheshunt, Mrs. John Laing, Mrs. W. J. Grant, La France, Madame Abel Chatenay, Kaiserin Augusta Victoria, Irish Beauty, Mildred Grant, and Gruss an Teplitz. The Roses are edged all round with Violas, J. B. Riding and Walter Welsh alternating. I strike Violas every other year from cuttings, and they make either a good groundwork or edging for Roses."

A Pear Arch.

In the kitchen garden I noticed a Pear arch of considerable length, forming quite an ornament.

"What are the varieties on the arch?" I enquired.

"Pitmaston Duchess, Jargonelle, Margaret Marillat, Louise Bonne of Jersey, and Marie Louise. The arch, which is of recent erection, is fifty-five yards long, and I think perhaps it might be made more ornamental by planting Roses on the top."

"You seem to go in largely for Strawberries."

"We only force two varieties, Royal Sovereign and Sir Joseph Paxton, but outside we grow Fillbasket, Laxton's Reward, the Bedford, Viscountess, Trafalgar, Givon's Late Prolific, and Laxton's Latest. We had a very good crop; in fact, this is our general experience; and I attribute it to the practice of digging the plants up after they have cropped twice."

"Do you manage to keep Black Currants free from mite?"

"The bushes you see have only been planted two years, and we have not had any trouble with them. The variety is Giant Boskoop, and this year the Currants are as big as Cherries. Morello Cherries and Gooseberries are grown on the wall."

Peas and Celery.

"Now, about vegetables?"

"We have a long succession of Peas from the end of June to the end of October. The varieties are Laxtonian, Sutton's Early Gem, Pioneer, Best of All, Gradus, Telephone, Ne Plus Ultra, Quite Content, Gladstone, Autocrat, and two new varieties, Curtis's Michaelmas and Dreadnought. The last two have done very well. Of Runner Beans, I grow Carters' Scarlet Emperor and Best of All; of Broad Beans, Green Windsor and Exhibition Longpod."

"You must have a quantity of Celery?"

"Nearly one thousand sticks, and also about two hundred sticks of Celeriac, which does very well. About three hundred Leeks are grown for cooking, and a few for showing."

"You show Onions also, I think?"

"Considerably; and I grow about six hundred for exhibition work, as well as a good stretch for kitchen purposes. The varieties for exhibition work are Ailsa Craig, Premier, and Cranston's Exhibition. I have also saved a few of my own."

How to Grow Show Onions.

In an admirably-appointed store-house, Mr. Avery then showed me a number of exhibition Onions, and I said,

"How did you get such magnificent Onions?"

"For large bulbs, I sow in January or early in February in boxes. The boxes are placed in a Vinery or warm house, on one of the shelves. After the plants are up, and have made their second flag or leaf, I prick them off in boxes, three inches apart, or pot singly into 3-in. pots. The plants are then placed in a frame on a mild bed until they are well rooted. I keep them close to the glass in order to prevent them becoming drawn. As soon as they have commenced to grow, I allow air on all favourable occasions, and well harden off before planting out. This is done about the third or fourth week in April. The soil for sowing and boxes consists of two parts yellow loam, one part Mushroom manure, one part leaf-soil, and some sand."

"You grow both Malmaison and Tree Carnations," I said, as we went in one of the Carnation houses.

"Yes. The varieties of Trees are Governor Roosevelt, Enchantress, Mrs. H. Burnett, Mrs. T. W. Lawson, Mrs. Brooks, Seaspray, Duchess of Marlborough, Mr. L. de Rothschild, and Aurora. The Malmaisons are Duchess of Westminster, Blush, Nell Gwynne, Churchwarden, Lady Grimston, Mrs. Hambro, and Princess of Wales. Clarkias in pots for spring-flowering are rather a feature. We had some plants last year six feet high. The variety is Double Rose."

The Culture of Clarkias.

"What is the culture of Clarkias?"

"The seed should be sown in August or September for spring flowering. As soon as it is large enough to handle, it should be pricked off in 3-in. pots, each pot containing three plants. The pots should be kept close to the glass in a frame, or on a shelf in a cool greenhouse. They should next be potted again in 5-in. pots, and once more about the second or third week in January."

"Do you devote the next house to Chrysanthemums?"

"No; it has, until lately, been full of Tomatoes, of which we grow Moneymaker, Sunrise, and Perfection. The variety of Chrysanthemum which now takes up all available space is Mrs. Thompson, which, as I told you in the conservatory, is our very latest, and I only brought the plants in to-day. There is no white superior for this work, and perhaps no variety better for the end of the season. In another house are seedling Chrysanthemums, all in 6-in. pots, and most of them singles. The varieties are Mrs. Buckingham, Mary Anderson, Hilda Laurence, Merstham Jewel, F. W. Warden, and Sir G. Bullough. More late varieties are in the Vinery."

Sweet Peas in Clumps.

"You might name the Grapes you grow in the Vineries."

"Muscat, Madresfield Court, in the early Vinery, with Asparagus plumosus on the back wall planted out. Muscats, with Lady Downe, are also grown in the late Vinery. The Peach house, which is now full of Chrysanthemums, is one hundred and ten feet long, and several varieties are grown."

"We have not said anything about Sweet Peas, which, I notice, are showing."

"They are usually grown in clumps four feet apart, in a good open position; the seed is sown in January in 6-in. pots, five seeds in each. After the seeds are up, we put small sticks round them to prevent them from falling about. We usually turn to account the old brooms for staking. The plants are hardened off and put out early in April. The varieties grown last season were Countess Spencer, Lady Sarah Spencer, Hon. Delia Spencer, Earl Spencer, Evelyn Hemus, Althorp White, Althorp Cream, Sea Foam, J. C. Waud, Elsie Herbert, Silas Cole, Mrs. H. Sykes, Etta Dyke, Frank Dolby, Duke of Westminster, and many others."

Clerodendrons and Acalyphas.

"What do you consider the features of your stove?"

"There are a few Orchids, and Clerodendrons, which are nice for colour and are rather a feature. The Orchids include Cypripediums, Cattleyas, Cœlogyne cristata, Calanthes, and a few hybrids. The only variety of Clerodendron is fallax. We usually take cuttings of this in February, pot them singly in thumb-pots, which are placed in a propagating frame till they are rooted Subsequently, we pot on to 3-in. pots in soil part loam, part leaf-soil, with well-rotted manure and sand."

"You have a nice show of Acalyphas."

"We keep them for Christmas, and the tails decorate the tables admirably. As to treatment, it is much the same as that of Clerodendrons. The Cucumber house is now full of Begonias—chiefly Gloire de Lorraine—Poinsettias, and Eupatoriums; and the next house has a number of Gesneras just coming out. Most of these are seedlings."

The Treatment of Gesneras.

"How do you treat Gesneras?"

"We pot up tubers singly in 5-in. pots in May, maintaining a temperature of sixty to sixty-five degrees. We keep them well shaded until they are rooted, and after the plants are three or four inches high, we give them more moisture, with a little weak manure water twice a week. When the flower-buds begin to show, to prevent them from becoming weakly, we place them fairly close to the glass. The soil consists of two parts peat, one part loam, and one part leaf-mould and sand. Here we have Coleus, which we use largely for bedding."

"When do you take cuttings?"

"Early in February or March. Five or six cuttings are put in a 3-in. pot, and placed in a propagating frame. As soon as they are well rooted, they are potted up singly in 3-in. pots, and kept in a temperature of sixty degrees. As soon as the pots become full of roots, the plants are transferred to other pots, gradually hardened off, and planted out when all fear of frost is over. The soil used is part loam and part leaf-mould, with sand."

"You must have taken a great many prizes, Mr. Avery?"

"I came here five years ago, and during that period I have gained over one hundred first prizes and five medals at different exhibitions for vegetables and plants. Before I came to Loudwater House, I had experience in Gloucestershire, Yorkshire, and Huntingdonshire; and after that I was foreman for four and a half years at Gaddesden Place, under Mr. Folkes, one of the oldest and most successful exhibitors of vegetables." ALFRED WILCOX.

"How Sweet Peas are Raised," an interview with Mr. George Herbert at Colden Green Nurseries, Twyford, Hants, will be the subject next week

Digitized by Google Original from CORNELL UNIVERSITY

THE GARDENS OF THE RIGHT HON. MARK LOCKWOOD, M.P.

Interview with Mr. A. Bagg, at Bishop's Hall, Lambourne.

SITUATED on the borders of Hainault Forest, several hundred feet above sea level, Bishop's Hall, Lambourne, the seat of Colonel Lockwood, M.P., is one of the finest mansions in Essex, with all the advantages of most picturesque surroundings. In some respects, the pleasure grounds, which I visited by the owner's courtesy in July, were a revelation to me. Their extent, variety, and arrangement are a remarkable proof of the capacity and skill of Mr. A. Bagg, the head gardener, who nearly a quarter of a century ago began the work of making the grounds. Under his auspices they have since been developed and enlarged. This process is still going on, and when we started on our necessarily protracted round of inspection, along The Chase, which leads from Mr. Bagg's charming cottage to the Hall, he almost immediately called my attention to an addition which was made only eighteen months ago. It consists of a number of beds, filled at the time of my visit with English Irises, but previously occupied with Pæonies officinalis, and earlier still with Narcissi, the object being to keep up a succession of flowers from the dawn of spring to the end of July.

"Here," continued Mr. Bagg, "are several Azalea beds, flanked by Rose beds, one containing Gruss an Teplitz, and the two others Gloire de Dijon. These beds are on the site of the field which was taken in at the beginning of last year."

"When were the Roses planted?"

"Only in the spring of this year. The beds were simply trenched two feet, and some cow manure put into the ordinary soil. No artificial manure was used."

Creepers on the Hall.

Approaching the Hall, and the south lawn, a noble Chestnut attracted my attention, as well as a fine show of Roses on the wall. I asked the probable age of the Chestnut.

"About one hundred and fifty years," rejoined Mr. Bagg, "and the tree is twenty-five yards through. The Roses on the wall and elsewhere in this vicinity, including the summer house, are Marie Baumann, Mrs. John Laing, Felicite Perpetue, Catherine Bell, Carmine Pillar, and Crimson Rambler."

"Then, there is the Hall itself?"

"On the verandah are Clematis montana and viticella alba, Lonicera in variety, Irish Ivy, Jasminum in variety, Clematis Jackmanii, and Wistaria sinensis; these are on the south front. On the north are Irish Ivy, Clematis Armandie, Ampelopsis in variety, Bignonia capreolata, and a Rose, Blairii II. When the late King Edward stayed here, his room faced north."

"How is the bedding in front arranged?"

"The contents are Geraniums Queen of Whites, sweet-scented Pheasant-foot, and a border of Alyssum maritima. Then there are four beds of scarlet Begonias, Phosphorens, edged by blue Lobelias. The Rose pergola, of which a good view is obtained from this point, includes Lonicera, and the groundwork is Geranium Madame Crousse, with an edging of G. Manglesi."

"What are the varieties in the adjoining bed of standard Calceolarias?"

"C. Burbridgeii, and C. amplexicaulis. Further on, facing west, is a bed of Gladiolus Gandavensis, edged with Alyssum; and beyond this is a bed with a grand specimen of Rose Mrs. Flight, while each side of the pillar is Clematis Jackmanii, the groundwork being Gladiolus Gildi, a pink variety, and Hyacinthus candicans."

Trees Planted by the King and Queen.

"You must tell me the names of some of the very numerous ornamental trees on the lawns."

MR. A. BAGG.

"First, the wonderful Mulberry which faces the grand old Chestnut is probably fifty years older. Between the two veterans is an Araucaria imbricata, planted when Colonel Lockwood was born. In this quarter is a Cupressus occidentalis planted when the Colonel entered Parliament, and a C. Lawsoniana, raised by me from seed, and planted on May 22nd, 1909, by the present King and Queen."

"I must mention at this stage the six beds of Geraniums, Paul Crampel, slanting to the sundial, which make such a bright show, but I should like to know the names of the varieties in the Eremurus bed."

"The Eremurus include Bungei, robustus, Warei, himalaicus, and Shelford. This is the first year E. Shelford has flowered. The aspect of this bed is north. As to treatment, I only give them a top-dressing annually, and lift the plants every fourth year. The Cannas in the neighbouring bed are mixed, and edged with Alyssums. The summer-house here is covered with Rose Celine Forestier, and Lonicera reticulata, with a groundwork of Geraniums Surprise (silver-leaved) and blue Lobelias. Another bed near the Irish Yew contains single Begonias mixed, edged with blue Lobelias."

Notable Specimen Conifers and Shrubs.

"Now we might have the names of more specimen trees and shrubs."

"Some of the most prominent are Abies nobile, Arbor Vitæ, Cedrus deodora, Taxodium sempervirens, Arbutus unedo, Abies orientalis, Thuja gigantea, Cupressus Fraserii, Retinospora plumosa. Hollies do well when they are established, especially Ilex Golden Queen and marginata."

"You have a thriving specimen of the Scarlet Oak."

"That was planted by King Edward on October 31st, 1895. Near the Quercus coccinea is Fatsia japonica, which is perfectly hardy out of doors. It used to be known as Aralia Sieboldii, and is more often seen in a greenhouse. The plant has been here between six and seven years."

"The soil seems to suit Berberis stenophylla?"

"The specimen you indicate is twelve feet through, and always flowers well. There is a new variety of Cotoneaster, with scarlet berries, C. Applantia, near it, and Abies concolor and Cedrus atlantica are neighbours."

"When did you plant the Rose beds in this quarter?"

"Only last winter. The variety of the groundwork is Madame Abel Chatenay, and in the centre is Buttercup. We cut Roses from these beds."

"Do you cut many flowers outside?"

"Sometimes as many as twenty boxes a week. Now we come to a bed which contains a collection of hardy Primroses. These were planted last autumn, and flowered in spring."

"Can you tell me the names?"

"Alba purpurea (fl. pl.), lutea (fl. pl.), lilacina (fl. pl.), sulphurea (fl. pl.), alba (fl. pl.), acaulis, cœrulea, Evelyn Arkwright, Crousse, Double Lilac, Rose du Barry, rubra (fl. pl.). The aspect of the bed is north, and the Primroses are planted in ground trenched two feet."

Azaleas and Rhododendrons.

Passing a border of flowering and other shrubs, we arrived at another recent addition to the pleasure grounds.

"This was made," said Mr. Bagg, "in 1908, and embraces several features. One is the number of hardy Ferns planted under the trees, and another the Rose beds. The latter are chiefly Madame Melanie Soupert, Lady Ashtown, and The Lyon, with Buttercup in the centre. Then, there are the Azalea beds, with Berberis at the back to hide the fence."

"Are there many varieties of Azaleas?"

"They are all named, and include Fama, coccinea speciosa, Unique, magnifica albicans, William II., Narcissiflora, chromatella, Bijou des Amateurs, Gloria Mundi, Bronze Unique, Queen Victoria, and Anna Louise. Opposite the Azaleas is a collection of named Rhododendrons, amongst which are John Walter, John Waterer, Mrs. John Clutton, Mrs. Holford.

Digitized by Google Original from CORNELL UNIVERSITY

Michael Waterer, Pink Pearl, Sir Arthur Guinness, Marchioness of Lansdowne, giganteum, Princess William of Wurtemberg, Princess Camille de Rohan, and Early Gem."

"Do you use peat in the soil?"

BISHOP'S HALL, LAMBOURNE.

"No. The soil is quite stiff, but the Rhododendrons grow and flower well. Although most of the pond was only made this winter, the Water Lilies are doing well. The varieties are Nymphæa alba, Pygmæa, rosea, Gladstoniana, Laydekeri purpurata, odorata major, odorata exquisita, odorata lucidium, Robinsonii, ignea fulgens. Planted behind the rustic house are Roses, Eulalias, Polygonums, New Zealand Flax, and Bambusa mitis growing by itself and doing well."

Giant Oaks.

"Facing the croquet ground you have a number of Rose beds?"

"Yes, but they do not form part of the addition. Here we are on the older part of the lawns. Among the Rose beds is one of La France; another of Perpetual Thalia; and a third Gruss an Teplitz."

"The croquet lawn is adorned by a noble Oak."

"Yes; this is the finest Oak we have, so far as habit is concerned. It is so pendulous that it sweeps the water. There is another giant Quercus, with a seat underneath it, and in close proximity is a bed of Rhododendrons Mrs. J. Clutton, surrounded by Pentstemons Newbury Gem, which have stood out all the winter—a quite unusual thing."

"You make a great display of Hypericums almost under the Oak."

"There are quite a dozen varieties, notably aureum, chinense, densiflora, Moserianum, Richerii, tomentosum, tricolor, and calycinum."

"What is your treatment of them?"

"The important points are to plant them with a little shade, but they will grow in a wet or dry position. Moserianum makes a fine subject for the border, and is very useful to cut from. Calycinum is grand to plant on banks or rising ground."

"How many Camellias are represented in the large bed near the Hypericums?"

"About a dozen, chiefly alba plena, tricolor Sieboldi, Chandleri elegans, Donckelaari, latifolia elegans, and Sophia Chirrerghi. The Clematis have only been planted three years. They flower in the spring. Partial shade is good for them, but they should not be planted against a wall. Here is a pond made about fifteen years ago, on the banks of which, and on the island in the centre, are many varieties. These include Spiræas, Rosy Cloud, venusta, Lemoinei pyramidalis, Silver Sheaf, Snow Plume, and palmata alba; Astilbes Davidii and rivularis major; Sagittaria variabilis; Lythrum Rose Queen; Butomus umbellatus; and Irises in variety, notably siberica and pseudo acorus."

A Former Rabbit Warren.

"Then you have a number of Bamboos."

"They are all the same variety, Metake, but there are Acers in variety. In the spring, a bed of Mimulus Gillingi is a blaze of gold, but to grow Mimulus satisfactorily they must have plenty of moisture. The Primulas in variety include two of the best new, Bulleyana and Littoniana, brought out by Bees, Ltd., of Liverpool; and both, as you see, are doing exceedingly well. On the banks of the water are also Osmunda regalis Ferns, and a group of Rushes. You may also like to make a note of a bed of Polygonum sachalinense, with its lovely foliage; the only attention required is top-dressing.

"The portion of the grounds through which we are now passing," continued Mr. Bagg, "was formerly a rabbit warren, and we still keep the Blackberries growing as they used to grow when the place was wild, though we have added others for decoration. Here is the upper Lily pond, with Blackberries on the island in the centre. We dug round the tree, and left it as it was originally. Near the pond is a nice plant of Senecio clivorum, whose large flowers of golden-yellow are very attractive. Senecio is a plant admirably suited for the banks of water of any kind, the only attention it requires being top-dressing. The specimen of Gunnera manicata next to the Senecio was planted five years ago, and is now fifteen feet through."

The Situation for Gunnera.

"Can you tell me the size of the magnificent leaves?"

"They are seven feet across. Of course, for Gunneras, a damp, shady situation is the best. At this point we touch on yet another extension of the grounds. This is the very latest, and was only made last winter."

"It appears to be on a large scale?"

"The features are principally hardy Ferns, Spiræas, Fuchsias, Primula japonica (in the ditch), Heleniums pumilum, Mimulus rosea, double white Arabis, Bambusa palmata, Deutzia gracilis (growing out of doors), and Irises in variety, all planted since Christmas. Outside in the carriage drive itself are various beds—one of Phlox Avalanche and Mrs. Jenkins, and another of Roses Fellenberg. Now we come to the Rosery itself, entered through an archway of Felicite Perpetue. Another archway is composed of Bennett's Seedling, Myranthes, L'Ideal. American Pillar is grown on poles; and Aimee Vibert and Gloire de Dijon as standards."

"Does the large centre bed consist entirely of La France?"

THE POND AT BISHOP'S HALL, LAMBOURNE.

"No, half La France, the other portion Gloire de Dijon. The ten beds round are Caroline Testout, General Jacqueminot, Lord Macaulay (a variety dating back twenty-six years), Abel Carriere, and three each of Mrs. John Laing,

Digitized by Google Original from CORNELL UNIVERSITY

and Ulrich Brunner. All the beds have been here three years. By constant pruning you can keep Roses a long time in the same position. Now you must see the Garnish Mead."

The Garnish Mead.

"When was this added?"

"Twenty-two years ago. I do not quite know the extent, but the beds were designed for colour, and with the leaves, shrubs, and trees, make up large pleasure grounds. It will be better to notice a few of the more conspicuous beds as we proceed."

"I observe that Delphiniums are doing well, and, in conjunction with golden Pansies, make a most brilliant show."

"The Pansies are Bullion; and the principal varieties of Delphiniums grown are The King of Delphiniums, Mrs. Creighton, Duke of Connaught, Mr. Faisier, and Bella Donna. The bed of Hollyhocks consists entirely of seedlings."

"They look so well that I should like to know your treatment of them."

"They are planted in ground which has been trenched two feet deep, with plenty of well-decayed manure added. The plants are raised under glass, and put out in April, weather permitting. Treated in this way, Hollyhocks are not so liable to suffer from the disease which often affects them seriously."

"How many varieties are there in the bed of Acers?"

"Twelve, with the Rose Starlight in the centre. They include dissectum purpureum, rubifolius panceus, versicolor, atropurpureum, and flavescens. Near the Acers is a bed of Roses, Marie Baumann, as groundwork, and the Thornless Rose in the centre. Quite one of the features is the great bed of Hermosa, the delicate China Rose; there are about five hundred plants, and they flower until the frost cuts them down. Another combination is a bed of Antirrhinums, Sutton's Intermediate, with Vitis megaphylla on a pole. Rosa Moyesii is grown as a specimen, and opposite it is another very handsome specimen of Sericea keracantha. A bed of single Asters has Vitis Thunbergi in the centre. Then we come to a plantation of Delphiniums and Montbretias, the latter including Pottsii, Bouquet Parfait, crocosmiæflora, and aurantiaca. A bed of Kalmia latifolia is combined with white Pansies and the Rose Niphetos. Other Rose combinations are Rubus Bambusa on a pole, with mixed Roses in the centre; Hiawatha as groundwork and on a pole; Papa Gontier as groundwork, with Shower of Gold on a pole; while in another bed, the Rose Ariel is grown on the pole, with a groundwork of Veronica Traversii."

Novel Combinations.

"Then you have Azaleas mixed with Roses?"

"A rather fine combination is represented by the Azaleas surrounded by Funkias grandiflora, with the white Banksian Rose in the centre scrambling amongst the branches of the neighbouring Catalpa bignonioides. Beyond a bed full of the Rose Mrs. Cutbush, is a large plantation of Hybrid Teas, faced by one of Hybrid Perpetuals; and then near the Five Oak Ways are two large beds of Michaelmas Daisies, a bed of Heleniums, and a large bed of Nasturtiums Sunlight."

"You have rather a novel bed just beyond the Five Oak Ways?"

"The bed itself consists of Lilium Henryi, the tripod in the middle being filled with Clematis in variety, with a groundwork of Pansies and an edging of Arabis. Archways of Vitis in this vicinity are ornamental, and then we come to a bed which is rather unique. It includes Clematis, and Ceanothus Gloire de Versailles; also Liliums tigrinum splendens, which come into flower the same time as the Ceanothus, and, with Prunus Pissardi behind, make a pretty picture. Behind this is what we call the Pampas garden, with Tritomas between, Marguerites, Hyacinthus candicans, and Gladiolus Brenchleyensis, with a border of Stachys latifolia. The Tritomas include Torchlight and grandiflora."

THE GARDENER'S COTTAGE, BISHOP'S HALL.

The Planting of Tritomas.

"How do you treat them?"

"We plant in ground broken up two feet deep. Tritomas Goldelse form a pretty combination with Pansies Admiration (dark blue); and quite in contrast to this is a bed of Chrysanthemums Morning Star, and Roses Lady Gay on poles. Other beds in the Garnish Mead include Betula laciniata pendula, with a groundwork of Portuguese Broom; a bed of Golden Elders, with variegated Strawberries outside, and Hyacinthus candicans planted between the Strawberries; two beds of Lupins, polyphylla rosea; and two beds of Helenium pumilum, edged with Echeveria. A large space is also devoted to Chinese Pæonies."

"When were these planted?"

"Some years ago. We only top-dress them after they are once established, making no addition to the natural soil, which is stiff loam. The Chinese Pæonies are at their best in June. Then we have a plantation of standard Roses, including Gloire Lyonnaise; Dorothy Perkins on a pole, with Blush Rambler each side, flanked by Richmond and Liberty as dwarfs; a bed of Pansies, with the Rose, Killarney, on a pole; and a large bed of mixed Roses, some on poles and others as groundwork. Here, too, are the Dahlias, of which the varieties are Paul Kruger, Constance, Mrs. Hawkins, Clown, Mrs. Taggart, Miss Jekyll, Ernest Glasse, Midnight, Charles Woodbridge, Cannell's Gem, Baron de Gavey, Solfaterre, King Leopold, Mikado, and Queen Emma."

A Big Rose Garden.

"Do you grow Sweet Peas in quantity?"

"Quite a hundred yards, which are sown in succession from January to May to cut from. All the best varieties are grown. You have still to see the Rose garden adjoining the kitchen garden."

"There seems to be no limit to the number of your Roses. What are the varieties on the arches here?"

"Trier, Blush, and Turner's Rambler in the centre; Turner's Rambler on the arches at both ends, Reve d'Or on the arch on the right, and Turner's Rambler on the arch on the left. In the border which runs round two sides of the garden are placed four poles, with Turner's Rambler, Lady Gay, Felicite Perpetue, and Ruga growing up them. The borders on both sides of the central path in the kitchen garden are planted with Roses, Lilium candidum, and Pinks."

"What about hardy fruits?"

"Apples, Pears, Cherries, Plums, Peaches, Apricots, Figs, Medlars, Quinces, Damsons, Raspberries, Gooseberries, and Currants in variety are grown; also great breadths of various vegetables. There are twenty-four glasshouses, but there is not time to go through them on this occasion."

Mr. Bagg's Career.

"And you have been here nearly a quarter of a century, Mr. Bagg?"

"I came to Bishop's Hall as head gardener over twenty-three years ago. As to the rest of my gardening days, I served my apprenticeship in Forde Abbey gardens, near Chard. Then I was at Leybourne Grange, Kent, for eighteen months, proceeding as plant foreman to Brocklesby Park, Lincolnshire. There I remained for four years, and for the next four years I was plant and fruit foreman at Bushbridge Hall, Surrey. From Bushbridge Hall I went to Ashburnham Place, Battle, in the same capacity, and at the end of twelve months I went to Gredington, near Whitchurch, Salop, as head gardener, staying there for seven years. Leaving Gredington, I was head gardener at Stone Park, Kent, for a year, and then I came here."

"I gather that you have been very successful in showing?"

"While I was at Gredington, I gained a good many prizes for fruit, flowers, and table decorations at Whitchurch and Ellesmere shows. Since I have been here, I have done particularly well at the Ongar flower show. In 1890, and again in 1896, I won the silver cup for Chrysanthemums."

ALFRED WILCOX.

THE subject for next week will be The Gardens of Sir Gilbert Greenall, at Walton Hall, Cheshire.

THE autumn show of the National Rose Society which was held last week, served to introduce a number of new seedlings, six of which obtained awards.

"GARDEN LIFE" ASTERS.—Mr. F. Dobson writes: "The Aster seed you sent out has yielded some really first-class blooms. It was very kind of you to send such high-class seeds, as I consider your paper alone grand value. Please accept best thanks for these, and also for your handbook, which was also very useful. I am rather late in writing, but better late than never."

Digitized by Google Original from CORNELL UNIVERSITY

Michael Waterer, Pink Pearl, Sir Arthur Guinness, Marchioness of Lansdowne, giganteum, Princess William of Wurtemberg, Princess Camille de Rohan, and Early Gem."

"Do you use peat in the soil?"

BISHOP'S HALL, LAMBOURNE.

"No. The soil is quite stiff, but the Rhododendrons grow and flower well. Although most of the pond was only made this winter, the Water Lilies are doing well. The varieties are Nymphæa alba, Pygmæa, rosea, Gladstoniana, Laydekeri purpurata, odorata major, odorata exquisita, odorata lucidium, Robinsonii, ignea fulgens. Planted behind the rustic house are Roses, Eulalias, Polygonums, New Zealand Flax, and Bambusa mitis growing by itself and doing well."

Giant Oaks.

"Facing the croquet ground you have a number of Rose beds?"

"Yes, but they do not form part of the addition. Here we are on the older part of the lawns. Among the Rose beds is one of La France; another of Perpetual Thalia; and a third Gruss an Teplitz."

"The croquet lawn is adorned by a noble Oak."

It includes Clematis, and Ceanothus Gloire de Versailles; also Liliums tigrinum splendens, which come into flower the same time as the Ceanothus, and, with Prunus Pissardi behind, make a pretty picture. Behind this is what we call the Pampas garden, with Tritomas between, Marguerites, Hyacinthus candicans, and Gladiolus Brenchleyensis, with a border of Stachys latifolia. The Tritomas include Torchlight and grandiflora."

THE GARDENER'S COTTAGE, BISHOP'S HALL.

The Planting of Tritomas.

"How do you treat them?"

"We plant in ground broken up two feet deep. Tritomas Goldelse form a pretty combination with Pansies Admiration (dark blue); and quite in contrast to this is a bed of Chrysanthemums Morning Star, and Roses Lady Gay on poles. Other beds in the Garnish Mead include Betula laciniata pendula, with a groundwork of Portuguese Broom; a bed of Golden Elders, with variegated Strawberries outside, and Hyacinthus candicans planted between the Strawberries; two beds of Lupins, polyphylla rosea; and two beds of Helenium pumilum, edged with Echeveria. A large space is also devoted to Chinese Pæonies."

"When were these planted?"

"Some years ago. We only top-dress them after they are once established, making no addition to the natural soil, which is stiff loam. The Chinese Pæonies are at their best in June. Then we have a plantation of standard Roses, including Gloire Lyonnaise; Dorothy Perkins on a pole, with Blush Rambler each side, flanked by Richmond and Liberty as dwarfs; a bed of Pansies, with the Rose, Killarney, on a pole; and a large bed of mixed Roses, some on poles and others as groundwork. Here, too, are the Dahlias, of which the varieties are Paul Kruger, Constance, Mrs. Hawkins, Clown, Mrs. Taggart, Miss Jekyll, Ernest Glasse, Midnight, Charles Woodbridge, Cannell's Gem, Baron de Gavey, Solfaterre, King Leopold, Mikado, and Queen Emma."

A Big Rose Garden.

"Do you grow Sweet Peas in quantity?"

"Quite a hundred yards, which are sown in succession from January to May to cut from. All the best varieties are grown. You have still to see the Rose garden adjoining the kitchen garden."

"There seems to be no limit to the number of your Roses. What are the varieties on the arches here?"

"Trier, Blush, and Turner's Rambler in the centre; Turner's Rambler on the arches at both ends, Reve d'Or on the arch on the right, and Turner's Rambler on the arch on the left. In the border which runs round two sides of the garden are placed four poles, with Turner's Rambler, Lady Gay, Felicite Perpetue, and Ruga growing up them. The borders on both sides of the central path in the kitchen garden are planted with Roses, Lilium candidum, and Pinks."

"What about hardy fruits?"

"Apples, Pears, Cherries, Plums, Peaches, Apricots, Figs, Medlars, Quinces, Damsons, Raspberries, Gooseberries, and Currants in variety are grown; also great breadths of various vegetables. There are twenty-four glasshouses, but there is not time to go through them on this occasion."

Mr. Bagg's Career.

"And you have been here nearly a quarter of a century, Mr. Bagg?"

"I came to Bishop's Hall as head gardener over twenty-three years ago. As to the rest of my gardening days, I served my apprenticeship in Forde Abbey gardens, near Chard. Then I was at Leybourne Grange, Kent, for eighteen months, proceeding as plant foreman to Brocklesby Park, Lincolnshire. There I remained for four years, and for the next four years I was plant and fruit foreman at Bushbridge Hall, Surrey. From Bushbridge Hall I went to Ashburnham Place, Battle, in the same capacity, and at the end of twelve months I went to Gredington, near Whitchurch, Salop, as head gardener, staying there for seven years. Leaving Gredington, I was head gardener at Stone Park, Kent, for a year, and then I came here."

"I gather that you have been very successful in showing?"

"While I was at Gredington, I gained a good many prizes for fruit, flowers, and table decorations at Whitchurch and Ellesmere shows. Since I have been here, I have done particularly well at the Ongar flower show. In 1890, and again in 1896, I won the silver cup for Chrysanthemums."

ALFRED WILCOX.

THE subject for next week will be The Gardens of Sir Gilbert Greenall, at Walton Hall, Cheshire.

THE autumn show of the National Rose Society which was held last week, served to introduce a number of new seedlings, six of which obtained awards.

"GARDEN LIFE" ASTERS.—Mr. F. Dobson writes: "The Aster seed you sent out has yielded some really first-class blooms. It was very kind of you to send such high-class seeds, as I consider your paper alone grand value. Please accept best thanks for these, and also for your handbook, which was also very useful. I am rather late in writing, but better late than never."

Thomas Bailey

Those who were in the habit of attending the metropolitan shows some few years since, will not have forgotten the magnificently grown and exquisitely-flowered Pelargoniums shown by Mr. Bailey, of Shardeloes, whose name is, moreover, familiar as a most successful exhibitor in other departments of horticulture.

Mr. Bailey was born at Croydon on October 13, 1806. He received his first horticultural lessons at home, in a market garden, where he remained until sixteen years of age, and thence removed to Addington Park, where he remained for two years, under the direction of the gardener, Mr. Buckwell On leaving Addington he went to Althorp Park, under his uncle, who was for many years park steward and gardener there.

The next situation upon which he entered was that of head gardener at Delapré Abbey, the seat of the late Edward Bouverie, Esq., where he remained for eleven years; from whence he removed to his present situation as gardener at Shardeloes, the seat of Thomas Tyrwhitt Drake, Esq., and which in March next he will have held for thirty-seven years. As regards matters of practice, Mr. Bailey writes in reply to our inquiries, “I think my most successful points have been fruit culture and Pelargonium culture.”

one, and should not be absent from the smallest collections. It is increased by division in spring.

S. palmata.—Second to no species in the whole genus, and one of the handsomest plants in cultivation. In a word, a form similar to our British Meadow Sweet, producing broader corymbs of bloom than even this, and of a deep purplish-red colour, the branches or stems to which these corymbs are attached, being more crimson still; set off by lovely foliage, which in autumn assumes also a pleasing ripening hue. To this may also be added the taller growing S. venusta, with rosy-carmine coloured flowers, and if need be, the white-flowered form of S. palmata, and the variegated-leaved S. ulmaria. *William Earley.*

CULTURAL MEMORANDA.

PLUMBAGO CAPENSIS.

This is a showy greenhouse climbing plant of free growth, yielding an abundant supply of sprays of beautiful grey-blue flowers during the summer and early autumn months. It is admirably adapted for draping a wall, pillar, or for training to a trellis as a pot plant. Cuttings taken now and inserted round the side of 3-inch pots, and placed in a Cucumber or Melon frame, will soon root. They should then be potted singly into properly drained 3-inch pots, in a compost consisting of three parts sandy loam and one of leaf-mould, put back in heat, watered, and shaded from bright sunshine for a few days until the roots have taken to the soil. As soon as the young plants have made fresh growths they should be stopped to make them branch. When the plants require more room at the roots they should be shifted into 4-inch and 6-inch pots respectively, again pinching the points out of the shoots soon after each shift has taken place. Thus grown, nice bushy little plants, having several trusses of flowers each, will be secured by the end of August next, and which will then be found very effective for intermixing with Pelargoniums, Fuchsias, Begonias, &c.

Cinerarias.

"J. H." states at p. 490 that his plants of Cineraria growing in 5-inch and 6-inch pots have heads of bloom from 6 to 6½ feet round, which, if the heads are close, are very good specimens of culture resulting from the size of pots indicated. We grow a goodly number of Cinerarias here, and which are now, as they have been for the last few weeks, in fine flower, and which are greatly admired by visitors as well as by my employer. The plants are growing in pots ranging in size from 6 to 10 inches in diameter in an admixture of three parts good turfy loam and one of sweet leaf-mould and pulverised horse-droppings, with a good sprinkling of drift sand added. They have compact heads of bloom measuring from 6½ feet to 9 feet in circumference. Had the plants been pegged or tied out the measurements indicated would have been considerably increased, as we have had heads of bloom on plants so treated nearly 4 feet in diameter, as a reference to back numbers of the *Gardeners' Chronicle* would show.

Bougainvillea glabra.

Although this climbing plant is classed in catalogues with the stove climbers it is, in my opinion, more adapted for a greenhouse temperature. It is a matter of fact that the finest specimens I have seen were grown in a greenhouse at Broadlands, Romsey, and Pyt House, Tisbury. It is a very suitable plant for draping a pillar or training thinly under the roof of conservatory or greenhouse, and when grown in a 12-inch pot in good fibrous sandy loam, and trained over a balloon or pyramid oval-shaped trellis it is very telling. Cuttings taken with a heel of the old wood from plants now starting into growth in a cool temperature, and inserted in small pots filled with sandy soil, placed under a hand-light or bell-glass in the stove and watered, will soon root. They should then be potted singly into 3-inch pots, afterwards shifting them into pots a couple of sizes larger, and by pinching the points out of the shoots once or twice to make them branch, and subsequently training the young growths to a small trellis, neat little table plants with trailing shoots, well furnished with pale mauve flowers or bracts and light green leaves, will be secured in due time.

Hoya bella.

This old favourite twining plant is not so often met with as its merits entitle it to be. Well cared for, the plant produces freely during the summer months lovely wax-like flowers, white, with a pink star-like centre, and delicately scented. It is a beautiful plant for a hanging basket in the stove. Cuttings put in now, in pots filled with sandy peat, placed in heat, and watered, will root freely; and if they are then potted singly into 3-inch pots, and grown on in heat and stopped a few times, they will make nice little plants by the autumn. *H. W. Ward.*

THOMAS BAILEY.

On the morning of Sunday, April 17, Mr. Thomas Bailey died, in his eighty-first year, at the gardens,

Shardeloes, Amersham, Bucks. For nearly fifty years he very successfully managed these gardens for T. T. Drake, Esq., whose confidence and esteem he enjoyed to the last. Mr. Bailey was a most enthusiastic and thoroughly practical gardener, who carried out every detail of his work in a most scrupulously systematic manner, and made a chief point of being well in advance with it. Of late Mr. Bailey did not exhibit frequently, but that was not the case formerly, as he used to be an almost regular contributor of plants, &c., at the metropolitan and provincial shows, and generally speaking his name was in those days to be found in the foremost place.

The magnificent plants of both kinds of Pelargoniums that he used to show will be remembered by many now as being wonderful examples of skilful cultivation. He likewise exhibited fruit, &c., sometimes, which was also remarkably good; and in the cultivation of some kinds but few have surpassed him, particularly in Providence Pine-apples. These, of great weight and size, he produced under the old-fashioned system, viz., in small places heated by means of fermenting materials. Melon cultivation was a favourite pursuit. He raised several new kinds; Bailey's Greenflesh is undoubtedly one of the best kinds in cultivation, and which has borne the test against others for the past thirty years at least. The vegetable garden was to him a delightful study, and it was very interesting to hear his description, &c., of some of the subjects which he treated almost as pets. His chief productions in this way comprise Bailey's Superb Cabbage, Selected Bath Cos Lettuce, and Pearl Cauliflower. This most valuable kind was recently introduced by Messrs. Veitch, London. The methodical way in which the rotation of crops and other kindred arrangements were carried out in his kitchen garden was at once observable to a practical hand, and without fear of contradiction it may safely be said that in the ordinary way of cultivation in this department here it stands second to none in the kingdom. *G. T. Miles, Wycombe Abbey, April* 20.

Mr. Bailey was born at Croydon on October 13, 1806. He received his first horticultural lessons at home in a market garden, at sixteen years of age removing to Addington Park, where he remained two years under the direction of Mr. Buckwell. On leaving Addington he went to Althorpe Park under his uncle, who was for many years park steward and gardener there. Leaving Althorpe after some time he became head gardener at Delapré Abbey, the seat of the late Edward Bouverie, Esq., where he remained for eleven years. In the year 1838 he became gardener at Shardeloes.

NARCISSUS LITTLE NELL.

Our illustration (fig. 107), taken from a drawing made by Mr. Hartland's niece, shows three flowers of a new variety introduced by Mr. Hartland, of Cork, and exhibited by him at the meeting of the Narcissus Committee at South Kensington on April 12 last. The elegance and beauty of the flower will undoubtedly render it a great favourite. It would be a great boon to those who have to fill greenhouses and conservatories in early spring.

THE HARDY FRUIT GARDEN.

INSECTS.

The foliage and buds of Peaches and Nectarines are very liable to attacks of greenfly and red-spider early in the season, and should therefore receive frequent and careful examination to see if any are present, when means must be taken immediately to eradicate them. Insecticides are not very suitable for this purpose in the early stages of growth, as the downy covering of the fruit absorbs the mixture, however carefully it may be applied, disfiguring the fruit. The most simple and easily applied remedy is tobacco-powder, which should be dusted over the infested trees, and washed off a few days afterwards with the syringe or garden engine, and again applied if found to be necessary. Should the Apricot maggot put in an appearance it can easily be detected by the leaves being rolled up; the leaves should be pressed between the finger and thumb, and so destroy it.

Watering.

Should the trees be protected by heavy copings, and become dry at their roots, advantage should be taken of the early part of a mild day to give a thorough watering, and (if not already done) give a good heavy mulching of well-rotted manure. Allowing the roots of wall-trees to become too dry is a fruitful source of bud dropping and the trees not setting their fruits. *E. Ward, Hewell Grange, Bromsgrove.*

Presentation.—Mr. William S. Bisset, Head Gardener and Land Steward to Sir Robert Drummond Moncreiffe, Bart., of Moncrieffe, Perth, N.B., has been presented with a handsome gold watch and pendant and a purse of sovereigns, by the members of the Kilgraston and Moncreiffe Curling Club, tenants on the Moncreiffe estate and numerous other friends, as a mark of the high respect and esteem in which he has been held during the thirty years in which he has discharged the arduous duties of his responsible position.

BAILEY Sarah Spalding.
Personal Estate £70.

15 December. Administration of the Personal Estate of Sarah Spalding Bailey late of 31 Varcoe-road Camberwell in the County of **Surrey** Widow who died 15 October 1887 at 31 Varcoe-road was granted at the **Principal Registry** to Henry James Bailey of 178 Rotherhithe-New-road in the said County Cooper the Son and one of the Next of Kin.

BAILEY Stephen Spicer.
Personal Estate £519 15s.

24 January. The Will of Stephen Spicer Bailey late of Ilfracombe in the County of **Devon** Master Mariner who died 20 November 1886 at Ilfracombe was proved at the **Principal Registry** by Mary Bailey of 21 Marmion-road Southsea in the County of Southampton Widow the Relict the sole Executrix.

BAILEY Susannah Maria.
Personal Estate £70 2s. 7d.

20 January. Administration of the Personal Estate of Susannah Maria Bailey late of Butterfield-row Keighley in the County of **York** Widow who died 6 May 1874 at Butterfield-row was granted at **Wakefield** to Amos Bailey of Well-street Ulverston in the County of Lancaster Iron Miner the Son and one of the Next of Kin.

BAILEY Theophilus.
Personal Estate £48 5s.

17 December. Administration of the Personal Estate of Theophilus Bailey late of 6 Amies-street Lavender Hill in the County of **Surrey** who died 30 October 1887 at 6 Amies-street was granted at the **Principal Registry** to Mary Bailey of 11 Amies-street Widow the Relict.

BAILEY Thomas.
Personal Estate £1,181 5s.

1 February. The Will with a Codicil of Thomas Bailey late of the City of **Coventry** Chemist and Druggist who died 28 June 1886 at Coventry was proved at **Birmingham** by Helen Elizabeth Bailey of 4 and 5 Burges Coventry Spinster the Daughter one of the Executors.

BAILEY Thomas.
Personal Estate £1,340 15s. 8d.

5 April. The Will with a Codicil of Thomas Bailey late of Elsecar in the Township of Nether Hoyland in the Parish of Wath-upon-Dearne in the County of **York** Farmer who died 10 December 1886 at Elsecar was proved at **Wakefield** by James Crawshaw of West Melton in the Parish of Wath-upon-Dearne Colliery Proprietor and Charles Long of Elsecar Butcher the Executors.

BAILEY Thomas.
Personal Estate £816.

28 May. The Will of Thomas Bailey late of Amersham in the County of **Buckingham** Gardener who died 17 April 1887 at Amersham was proved at **Oxford** by Ann Elizabeth Bailey of Amersham and Caroline Bailey of 63 Abington-street Northampton in the County of Northampton Spinsters the Daughters the surviving Executrixes.

BAILEY Thomas.
Personal Estate £41 10s.

7 June. The Will of Thomas Bailey late of Leicester in the County of **Leicester** Gentleman who died 18 May 1887 at Leicester was proved at **Leicester** by Elizabeth Bailey of 23 Aylestone-street Leicester Widow the Relict the sole Executrix.

Thomas Baines

Gardeners' Chronicle 1875, n.s. 3

The name of Thomas Baines has become a household word amongst gardeners, while a most honourable niche in the temple of horticultural fame has been won by its possessor, to whom may be fairly assigned the premier position as a plant grower at the present day. Of this the gardening records of the past few years are a sufficient attestation. The Thomas Baines to whom we refer, and whose portrait accompanies this notice, comes of a race of successful gardeners dating back some three or four generations. He was born in July, 1823, in the then entrance lodge to Claughton Hall, the seat of the Brockholes, of Claughton, in North Lancashire, one of the oldest families in the country, they having been in uninterrupted possession of the estate since the time of Edward II. Whitaker, in his History of Lancashire, traces the Baines family on the estate for 400 years. His great-grandfather, Thomas Baines, whom, he remarks, he well recollects, died at the age of ninety-six, at Claughton Hall, after having been for many years steward of the estate for the grandfather and uncle of the present James Fitzherbert Brockholes, Esq. His grandfather served his time in the garden at Claughton, and held the head-gardener's situation for fifty years; and his father was also there brought up to the profession.

"From early childhood," writes Mr. Baines, in the notes which accompanied his portrait, "I was passionately fond of gardening. My first essay, and the one most indelibly fixed upon my memory, occurred when I was about five years of age; I then assisted my mother in planting some Ivy near the door of the lodge, which Ivy now forms a complete porch over the door, and in the forty-five years which have elapsed has developed a trunk 33 inches in circumference. At thirteen years of age I commenced my gardening career under my grandfather, who was a really good gardener of the old school, and was well known in the north of the kingdom as a most successful grower of fruits, especially of Grapes. Indeed the fine old Vines planted by him some sixty years ago still bear ample testimony to the careful preparation first made for them, since they have never even had the soil renewed, and at the present day finish off such crops of sloe-black fruit, both early and late, as are rarely surpassed. In common with most garden-boys at that day I had to submit to what, even if against one's will, was of great advantage afterwards—that is to say, I had to commence at the foot of the horticultural ladder. There was in those days little chance of a youngster trying his hand at the walls until he was sufficiently initiated in the work of the kitchen garden, or in the houses, until he knew something considerable about both. In most of the old establishments fruit and vegetable culture were the chief considerations, with such plants as sufficed for decorative purposes, and to furnish the comparatively small demand for cut flowers which was then made. Having fewer subjects to deal with, the young men learnt their culture, especially the things of a utilitarian description, more thoroughly. First impressions are lasting, more especially those affecting one's occupation, and if a man be from the first engaged in fruit culture, he will always feel a preference for it. Nevertheless, I was very fond of plants, and in the summer of 1842 walked 30 miles to see Fuchsia corymbiflora; railroads were not so plentiful then as now, neither was the money to spend in riding over-abundant, so that young men situated as I was, thought less of using their legs.

I was excessively fond of reading. The books on gardening and kindred subjects to which I had access were not over-numerous, but they got pretty well thumbed. I also dropped upon an old copy of one of Linnaeus' works, over which for years I used to spend an hour or so of an evening out in the fields; but I was ultimately with reluctance obliged to give it up, seeing the impossibility of getting sufficient time for studying the science in a way likely to lead to proficiency. If young men in gardens in remote parts of the country had then comparatively few professional and really useful books for perusal, there was at least this advantage, that there was much less of the fascinating but useless light reading which is the bane of learning at the present time. Half the young men in gardens now indulge far too much in this sort of literature ever to become versed in the most

essential knowledge of vegetable physiology. I also read every book I could procure upon landscape gardening, and had a good opportunity of seeing such work practically carried out and judging of the effects produced, for, in addition to the natural beauties of the finely-wooded undulating grounds of the estate, alterations on a large scale were continually going on under the personal direction of the late Squire, who was known to be one of the very best landscape men of his time, and who succeeded in making the property unsurpassed in general effect by any in the country. Here were hundreds of miles of draining done before many people could see the necessity for draining at all; old fences were leveled and new roads made, large tracts of land were trenched and planted, irrigation on a large scale was carried out, and work of all sorts was done, such as afforded an excellent opportunity to any young man who was disposed to take a general interest in the cultivation and improvement of the land, as well as its effective embellishment upon correct principles of landscape art. Here were large open breadths to deal with, that gave scope to the planter in massing trees of distinct colours at different elevations, and which the undulating nature of the land admitted. As this work was going on for many years, it gave me an excellent opportunity to observe how it was done, and to note the effect produced in after years.

High farming was also carried out at Claughton, and in this I took much interest, especially in connection with stock, for which that part of the country was, and still is, celebrated. My grandfather, with whom I lived during the time of my learning the business, continually impressed upon me the necessity for a gardener being well acquainted with general farming, in consequence of the frequency with which one individual is required to act in the double capacity of manager both of farm and garden. With this in view, I went, at twenty years of age, for some three years to the best general farmer in the neighbourhood, where by practical experience I was enabled to acquire a knowledge which in after years has been of the greatest service to me. Through those early years and up to this time I went regularly to a night school.

I then engaged as gardener to S. L. Behrens, Esq., of Catteral House, near Garstang, in Lancashire, and afterwards removed with the family to the Polygon Avenue, Ardwick, near Manchester. Here Mr. Behrens became extremely fond of plants, and we soon got together a nice collection of Orchids, Heaths, stove, greenhouse, and fine-foliage plants, and Ferns, as well as most of the best florist flowers of the day, including Auriculas, Dahlias, Pansies, Pinks, Carnations, and Hollyhocks. These latter, although never exhibited, were just as carefully prepared by tying, thinning, and shading, even to the providing of stands similar to those used for exhibition, and in which the flowers were arranged for placing on the tables in the entrance hall. Few men had a more perfectly trained eye, or better taste as regards the appreciation of form and colour, either in a painting, a well-kept garden, or a florist's flower; and although at present we have such a furore against exhibiting these in the only way in which it is possible to decide their merits, unnatural as it may be, Mr. Behrens, even in his own house, could best enjoy and admire them when thus arranged in the way calculated to display their individual excellence.

I remained in Mr. Behrens' service for seven years, until he went to reside abroad, I then engaged with his cousin, H. L. Micholls, Esq., with whom I lived for twenty years—first at Bowdon, in Cheshire, where the collection of plants I had charge of was formed, and afterwards at Southgate. Mr. Micholls was exceedingly fond of his garden, and took the greatest delight in watching the growth of the plants, from their earliest stages up to the time of their full development. At the commencement, a few dozens in 6-inch pots were purchased, and this was kept up yearly, so as to provide a supply for filling up the places of such as got worn out or died—for plants, in common with other things possessing life, are liable to lose it by these natural causes; and those who profess to have few or no losses must be much more fortunate than I have been, or must possess some secret

whereby vegetable life is indefinitely prolonged. Strictly speaking, the plants were not a collection, but a selection, representing most of the popular kinds at present in cultivation, requiring a wide range in the difference of their treatment.

I feel the greatest repugnance to personal allusion relative to anything I have individually accomplished in this respect. The pursuit somehow begets feelings which are unobtrusive and reticent in their nature. In it, as in most other things, if a man is not able to do much, the less said the better, and if he does ever so little worth notice, the world is honest enough to give him all the credit he deserves. If, then, I make any allusion to my own doings, it is with a view of throwing a little light on the path of young men who may follow in the same track. Amongst the different plants I have grown, nineteen-twentieths were utterly strange to me, as I had no opportunity in early life of becoming acquainted with their usual treatment. This was in some measure an advantage, as I had nothing to unlearn. I always had a liking for growing plants that had the character of being difficult to cultivate; and whatever measure of success I may have been able to arrive at in the cultivation of such, I owe it to a close study of the nature and consequent requirements of vegetable life, and the natural conditions under which different plants exist in their native habitats. This I learnt in my younger days through the diligent reading of such books as treated upon the climate and soil of foreign countries, and the general conditions under which the plants we receive from them exist. A want of this knowledge is the rock upon which many young men, who attempt to grow difficult plants, split. Such reading is, however, distasteful to those who have become habituated to light literature.

Five years ago Mr. Micholls removed from Bowdon to Southgate House, near London, to which place I accompanied him and remained until his disposal of it and the dispersion of the plants. Few gentlemen take a greater delight in gardening than did he, or encourage it through a more genuine love of plants for their own sakes. From him, and the family in general, I experienced uniform kindness and liberality, such as is seldom accorded to a gardener."

Parisian life, whose name it now best commemorates; and we are glad of the opportunity to publish some facts concerning him, for which we are indebted to our correspondent, Monsieur Edward André of Paris.

Jean François Boursault was born in Paris in 1752; or, according to the *Dictionnaire Larousse*, toward 1760, and died in Paris in 1842. He was the great-grandson of Edme Boursault, a poet and author of some celebrity, and the son of a linen-draper in easy circumstances of the Quartier des Innocents. Boursault early left Paris to follow a band of travelling players, making for himself some reputation in his earliest *rôles*. Admiration for his ancestor, the dramatic author, influenced his choice of the theatrical profession, and out of respect to the memory of his name, which he did not want to run the risk of having hissed, he adopted that of Malherbe, which he retained as long as he continued on the stage. Boursault established a French theatre at Palermo, but being unfortunate, and his affairs involved, he took advantage one day of King Ferdinand's passing to throw himself into the sea. This excellent method of getting his head above water, as a wit of the time remarked, succeeded admirably. A crowd collected, the curiosity of the king was excited, and Malherbe, who had been fished from the water, was brought before him. The actor described his miserable condition in such a dramatic manner that the sympathy of the king was moved, and he gave him money enough to pay his debts. Returning to Paris at the beginning of the Revolution, Boursault plunged into the movement with enthusiasm, but soon afterwards returned to the stage, and had built for himself in the passage des Nourrices, between the Rue St. Martin and the Rue Quincampoix, a theatre which he called Théâtre Molière. In 1806 Boursault changed the name of his theatre, which he now called Théâtre des Variétés Étrangères, and undertook to play Shakespeare, Schiller, Lope de Vega, &c., an undertaking which soon failed. Next we find him engaged in cleaning the streets of Paris. His street-cleaning contract and the gambling-houses, which he obtained control of later, made him immensely rich, and he became known for his taste in horticulture and his collections of plants. The garden of his villa in Rue Blanche and his gallery of pictures were among the most famous in Europe. He collected in his hothouses the rarest plants of the two hemispheres. In 1830 he bought for three millions of francs the Salle Ventadour, and became Director of the Opéra Comique. This venture was not successful, and he was on the point of failing, but eventually was able to save his fortune. After this, with the capriciousness of old age, Boursault sold his famous gallery, pulled down his hothouses, which were the richest and best stocked in France, and perhaps, in Europe; destroyed his park, building on its site two rows of houses, which now form the Rue Boursault. This was his last fantasy and his last undertaking, for he died shortly afterwards, leaving a large fortune.

Obituary.

Mr. R. B. Laird.—The death occurred on the morning of Monday, March 4, at Dundee, of Mr. R. B. Laird, senior partner of the firms of R. B. Laird & Sons, nurserymen, Edinburgh, and W. P. Laird & Sinclair, Dundee. An affection of the heart, which unexpectedly showed itself, was the cause of death. Born at Balgone, North Berwick, in 1823, Mr. Laird went at an early age to Dundee, and under his elder brother, the late Mr. W. P. Laird, learnt the business of nurseryman and seedsman. He came to Edinburgh in 1843, and was about five years in the establishment of Messrs. Dickson & Co. In 1848, along with the late Mr. John Downie, he founded the business in Frederick Street, and lately at West Coates, which was well known for many years as Downie & Laird. Mr. John Laing joined the firm afterwards, and for some years the business was carried on in Edinburgh, London, and Sydenham, under the title of Downie, Laird & Laing. At the dissolution of this partnership the firm was carried on under another designation by himself and his sons, and latterly he has been for the most part resident in Dundee, where another branch was established. A man of strong individuality, with excellent business capabilities, and of a genial and amiable disposition, Mr. Laird was widely known in the horticultural world, and was one of the remaining links between the past and present generation of horticulturists. By many gardeners, old and young, he will not soon be forgotten. He was always ready to lend a helping hand to those in need of assistance, and he spent much time in doing what he could to further the interests of young gardeners, and to get them a start in life. He was one of the founders of the Dalry Congregational Church, and one of the original elders. For many years he was a director of the Scottish Trade Protection Society. *Scotsman, Tuesday, March* 5.

Thomas Baines.—We greatly regret to announce the death of Mr. Thomas Baines, a personality well known to horticulturists in most parts of the country as a first-class cultivator of plants, an exhibitor of renown in former days, and latterly a successful landscape-gardener. The deceased had been in failing health for the past two years, and fell a victim to the prevailing epidemic of influenza. He died at his residence at Fern Cottage, Palmer's Green, N, on Saturday, March 2, at the age of seventy-two years, and was buried at the Great Northern Cemetery on the 7th inst. We publish anew extracts from an article that appeared under the heading "British Gardeners" in these pages on February 6, 1875, which accompanied a portrait of him as he then appeared:—

"He was born in July, 1823, in the then entrance-lodge to Claughton Hall, the seat of the Brockholes, of Claughton, in North Lancashire, one of the oldest families in the country, they having been in uninterrupted possession of the estate since the time of Edward II. Whitaker, in his *History of Lancashire*, traces the Baines family on the estate for 400 years. His great-grandfather, Thomas Baines, whom, he remarks, he well recollects, died at the age of ninety-six, at Claughton Hall, after having been for many years steward of the estate for the grandfather and uncle of the present James Fitzherbert Brockholes, Esq. His grandfather served his time in the garden at Claughton, and held the head-gardener's situation for fifty years; and his father was also there brought up to the profession.

"From early childhood," writes Mr. Baines, in the notes which accompanied his portrait, "I was passionately fond of gardening. My first essay, and the one most indelibly fixed upon my memory, occurred when I was about five years of age. I then assisted my mother in planting some Ivy near the door of the lodge, which Ivy now forms a complete porch over the door, and in the forty-five years which have elapsed, has developed a trunk 33 inches in circumference. At thirteen years of age I commenced my gardening career under my grandfather, who was a really good gardener of the old school, and was well known in the north of the kingdom as a most successful grower of fruits, especially of Grapes. There was in those days little chance of a youngster trying his hand at the walls until he was sufficiently initiated in the work of the kitchen garden, or in the houses, until he knew something considerable about both. In most of the old establishments, fruit and vegetable culture were the chief considerations, with such plants as sufficed for decorative purposes, and to furnish the comparatively small demand for cut flowers which was then made. Having fewer subjects to deal with, the young men learnt their culture, especially the things of a utilitarian description, very thoroughly. Nevertheless, I was very fond of plants, and in the summer of 1842 walked 30 miles to see Fuchsia corymbiflora; railroads were not so plentiful then as now, neither was the money to spend in riding over-abundant, so that young men situated as I was, thought little of using their legs."

At that time much landscape-work was being done at Claughton, including draining, a subject then not much understood or practised. These operations, on a large scale, much interested young Baines, and gave him, as he said, an excellent opportunity to observe how it was done.

The high-farming at Claughton also interested him much, especially in connection with stock. Through those early years he went regularly to a night-school.

The narrative continues: "I then engaged as gardener to S. L. Behrens, Esq., of Catteral House, near Garstang, in Lancashire, and afterwards removed with the family to the Polygon Avenue, Ardwick, near Manchester. Here Mr. Behrens became extremely fond of plants, and we soon got together a nice collection of Orchids, Heaths, stove, greenhouse, and fine-foliage plants, and Ferns, as well as most of the best florist flowers of the day, including Auriculas, Dahlias, Pansies, Pinks, Carnations, and Hollyhocks. These latter, although never exhibited, were just as carefully prepared by tying, thinning, and shading, even to the providing of stands similar to those used for exhibition, and in which the flowers were arranged for placing on the tables in the entrance-hall. Few men had a more perfectly-trained eye or better taste as regards the appreciation of form and colour, either in a painting, a well-kept garden, or a florist's flower.

"I remained in Mr. Behrens' service for seven years, until he went to reside abroad. I then engaged with his cousin, H. L. Micholls, Esq., with whom I lived for twenty years—first at Bowdon, in Cheshire, where the collection of plants I had charge of was formed, and afterwards at Southgate. Mr. Micholls was exceedingly fond of his garden, and took the greatest delight in watching the growth of the plants, from their earliest stages up to the time of their full development.

"In 1870 Mr. Micholls removed from Bowdon to Southgate House, near London, to which place I accompanied him, and remained until his disposal of it, and the dispersion of the plants."

Mr. Baines was a very prolific writer on a great variety of horticultural subjects, and had been for a long series of years a correspondent of this journal. He was the author of a useful book of reference, entitled *Greenhouse and Stove Plants*, which was published in 1885.

Markets.

COVENT GARDEN, March 7.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

MODERN GRAPE GROWING.

The Border.

(*Continued from page 252.*)

The principal objects of a Vine border are to protect and keep the roots in position, and to afford a suitable medium for conveying food to the root hairs. The chemical constituents of the soil are of minor consequence compared with its physical condition. You may have a soil with the dozen or more elements and compounds essential to the Vine's prosperity, so beautifully balanced that nothing more could be desired in that way, and yet it may be comparatively sterile.

On the other hand, if you possess a soil which is physically right and contains nothing obnoxious, it is an easy matter to make it fertile and to keep it so. Whatever soil the Vine may succeed in abroad—and I am told it often flourishes well where there is hardly any soil at all—experience teaches us that there is nothing suits our purpose so well as a rather heavy loam, that is a soil containing not less than 30 per cent. of clay in almost invisible particles.

Do not let it be thought from this that I disparage the work of chemists, far from it. There is nothing I devour more greedily than records of experiments made by such men as Messrs. Lawes and Gilbert, and certainly any honours that can be bestowed on the world's benefactors ought to be theirs. But if anyone thinks that by paying a few shillings for an analysis of his soil at the village laboratory, even if the presiding genius should be a Davy or a Voelcker, his fruit-growing is going to be made a matter of rule and thumb, he will find himself woefully mistaken. Analysing a soil is not such an easy matter as it appears to the uninitiated. It requires a good many delicate operations if it is to be done thoroughly; and after all, though the ingredients may be there which would render the soil a fertile one so long as it was a ploughed field, a Vine border has the disadvantage of being very much shut off from the beneficial action of frosts and winds, sunshine and showers, and must to a great extent be dependent on the cultivator.

Analysing manures is by comparison an easy matter, because everyone who has learned the rudiments of agricultural chemistry knows what they should contain, and thanks to our legislators no one need now buy quack mixtures, though they do buy them and will continue to do so. Those having a good soil to deal with, and abundance of energy in themselves, may succeed in spite of the quackery, in the same way that people having a good constitution, make their supper, when they have fancied ailments, off Mrs. Swindle's tincture of soap bubbles, and still live. Of course, the tincture gets the credit of saving their valuable lives for the benefit of humanity at large, and Mrs. Swindle is immortalised.

Sometimes it is difficult to secure a soil that is physically correct, and then recourse must be had to mixing. There is no doubt a natural soil is best if you can get it in proper form, but clay can be dried and beaten into powder so that it shall appear almost like a part of the natural soil itself. On the other hand, if a soil contains too much clay and too little sand, there are many other gritty substances to choose from which will be better than sand for mixing, such as mortar from old buildings or burned clay. If a soil does not contain sufficient clay it is not holding, water passes through it too freely, and remember that every time you water a light, loose soil you wash something out of it.

Also it is not retentive of manure. If you use a chemical fertiliser you apply so much to the square yard according to the printed directions received from the vendor, a small part of which goes to the plants and a large portion to the drains. The worst of it is you have no means of knowing how much is retained by the soil, whether too much or too little. Again, what is called a light soil, if it is sandy, gives a great portion of its moisture to the air in the way of evaporation. A soil which is too heavy also has its drawbacks. It may hold the water too long, and not be sufficiently porous to admit air, consequently it will become sour, so that no roots can grow in it, or, if they manage to do so, will not ripen, and the leaves soon find this out.

It has been my lot to have the two extremes to deal with in the matter of soils. In the kitchen garden at Longleat the soil is so stiff that if worked at all when wet it is injured for years after. One portion, about twenty-eight years ago, had some of the subsoil taken out and burned on it by one of my predecessors. The ground, I have been told, was wet at the time, and the axles of the barrow wheels ran uncomfortably close to the soil. Of course the burned material was placed on the top and dug in, but the ground had not recovered when I last saw it, and probably has not done so now, although I made a practice of keeping a fire going the greater part of every winter outside the garden, burning refuse and clay, and this particular patch must have had at least 4 inches of such material put on it during my superintendence. Such ground when well managed grows enormous crops of splendid quality in a season that is not too wet, but it requires a great deal of humouring.

Now, in this neighbourhood it is altogether different. I see men working the ground immediately after and indeed during heavy rain, and this does not seem to hurt it at all. I have seen the best of farmyard manure placed 8 or 9 inches deep over it, and buried with great difficulty by a man with a spade. Very good Mangold was grown on it, but it would want manuring again the following season. Where grass is grown there is very little of what can be called soil before we come to a yellowish sandy material, loose at first, but a little deeper it takes out and looks like clay. It crumbles when exposed to the air, and its capacity for absorbing and disposing of vegetable manure is something marvellous. Going deeper we find some clay mixed with the sand, and at 8 or 10 feet come on a very soft bluish clay, and this when dried and pulverised, by the action of frost preferably, or pounded, is what we use principally to mix with our Vine soil.

If a soil that is neither too heavy nor too light can be obtained with the turf on it, all well and good. If not we can do without the turf, and when necessary alter the material to make it of the right density. It is an advantage to have at least a little turfy soil to start the Vines in, but there is no particular need for a large amount of fibry turf; indeed it is apt to make the border too rich in nitrogen, causing at the first rampant growth and large pith. The pith, I believe, is what you make it at first, it never enlarges. The part it plays in the plant's economy is, so far as I am aware, not well understood, but no one likes to see too much pith.

When one is starting Vine-growing in a new place where the soil and surroundings are strange, it is advisable to begin cautiously, for even after a life's experience one is easily out of his reckoning. I would recommend starting with perfect drainage and narrow borders, say 4 or 5 feet in width, and then feel one's way during the next year or two.—Wm. Taylor.

(To be continued.)

THE LATE MR THOMAS BAINES.

Miss Baines favours us with an excellent portrait of her late widely known and much-respected father. It will be recognised by many of our readers as a life-like delineation of the famous plant grower, gardener, and judge, while those who may not have had the privilege of knowing Mr. Baines will be pleased to see what manner of man he was as he went about so actively from show to show in his latter years, and from garden to garden in the course of his landscape work. The portrait is taken from an oil painting by Mr. C. F. Lowcock, who has been very successful in producing a characteristic likeness of Mr. Baines, who was a man of mark in the gardening world in which he worked so long and so well.

THE LONG FROST AND INSECTS.

Some of my friends, while emphatic in their complaints as to the damage caused by the long frost to many plants and shrubs, are rather jubilant over the supposed effects it has had upon insect life. It must have killed many, they say, above ground and beneath. I have felt myself obliged to discourage them a little by telling them we do not know just yet; we are unable to judge of its results till the world of insects are once more aroused by the influences of spring. The observations of entomologists on the insect tribes generally tend to the conclusion that the hybernating species can stand severe cold better than mild and moist weather. Certain it is that no amount of cold would injure insects' eggs, nor affect to any great extent such moths and beetles as live in their perfect stage from the winter to spring. About those in the pupal or chrysalis stage there may be more doubt. The species that are usually exposed to all the weather of winter are so seasoned to it, I should say, that a prolongation of frost, or some degrees of extra intensity, would not be likely to touch them. We shall soon be able to ascertain whether the two common white butterflies (Pieris Brassicæ and Rapæ) which emerge in April to deposit eggs about gardens have had their numbers diminished by death of pupæ.

Amongst the Noctua group of fat-bodied moths we have several destructive species which pass the winter as pupæ under the soil, but not buried at any great depth. A familiar example is the too abundant Cabbage moth—Mamestra Brassicæ Possibly some of these have been killed by sudden change of temperature in this way. On two or three days in February the sun shone brightly, melting a layer of snow, the warm fluid then partly entering the earth; but after sunset the temperature fell rapidly, and a sheet of ice formed that would freeze up pupæ near the surface which had been previously thawed by the sun. But there is this to be considered also—that many birds during the winter seek out and eat pupæ, which by the long frost obtained protection from their enemies, the ground resisting the birds' bills and feet. Mild winters are helpful to the birds hunting, not only pupæ but other subterranean insects, and when the mildness is accompanied, as it often is, by heavy rainfalls, that destroys hybernating species by inducing a sort of disease, attended by fungoid growth on the skin.

Gardeners, I know, generally suppose that a cold winter lessens their insect enemies next season. This does not seem to be the case, taking the majority of species, but rather the reverse. Still, the early months of 1895 were exceptional, owing to the severity of the frost, and its prolongation towards the spring, though it is the fact that caterpillars may be so congealed as to chink like stones if shaken in a box, and afterwards recover. Some, of course, could not endure such intense cold. Then, again, we must remember that instinct guides many caterpillars to descend deeper into the earth when frost is approaching, wherein they have much the advantage of our water pipes. Whether any of the caterpillars that pass the winter in a silken abode—the brown-tail, for instance—would strengthen its walls during sharp frost, if awake enough to do so, we cannot tell. Amongst the feeders upon wood, our persistent enemy, the goat caterpillar, destroyer of many ornamental and also some fruit trees, prepares for itself a warm retreat, well lined

Digitized by Google

with silk and chips, for its security in the winter. Probably a similar plan is followed by the leopard caterpillar, a resident in various trees.

The much smaller caterpillars of several clearwing moths, which pass their life in stems, branches, or twigs, take up a winter position where they will be least exposed to the cold; but they appear to feed all that season—at least, such is the habit of the species infesting the Currant, Pear, and Apple. I expect the winter has seen the death of many of those insects which secrete themselves under loose bark, birds having been very diligent in their researches on tree trunks, after the supply of spring it feeds upon various plants, such as Lettuces and Strawberries; before hybernation it is often found infesting Hollyhocks, amongst other garden species. The habit of this caterpillar is to hide near the ground during the cold season, and a per-centage, I expect, will have been killed by the snow or frost, though their coats are some protection.

Unshielded, however, is the caterpillar of the Currant moth (Abraxas grossulariata), some individuals of which conceal themselves amongst stones or refuse in the winter, while others brave it by simply fixing themselves firmly upon a twig of their favourite bush. Hardy fellows they,

FIG. 51.—MR. THOMAS BAINES.

berries began to fall short. It would be pleasant to think the frost was likely to make a reduction in the number of the aphis hosts of the spring, but I expect it will not; the eggs would not be affected, nor probably the insects, "queen aphides," or other adults which hybernate under the earth or in various nooks, their bodies seem to be well stored with oil.

We will just notice a few species of garden and orchard insects, where the hybernating caterpillars or larvæ of last winter may not have escaped entirely from its effects. A familiar insect at once occurs to us in the caterpillar of the tiger moth (Arctia caja), often called the "woolly bear," though not clothed in wool, but black-and-grey silk. During the as I know from observation, but February, 1895, may have been a bit too sharp for them, though not markedly injurious to our Currants and Gooseberries. Then there is the caterpillar of the angle shades (Phlogophora meticulosa), one of the very few caterpillars that feed through the winter, quite exposed to the weather, upon any garden plants that may be accessible, such as young Chrysanthemums, Primroses, and early Peas, a velvety leech-like fellow, brown or greenish, with white lines and dots; some of these I saw about in December, but since then they have disappeared.

Another of the hybernators common in gardens is that to which

MR. THOMAS BAINES.

OBITUARY.

MR. THOMAS BAINES.

We regret to announce the death of Mr. Thomas Baines, which took place last Saturday at Palmer's Green from influenza and pneumonia. Among the best gardeners few, if any, were better known than Thomas Baines, who first distinguished himself as a plant grower, perhaps the best grower of our time. Afterwards he became an author and also designer of gardens. So far as we can judge in our own time, there never was a better plant grower than Thomas Baines, as tested both by the northern shows and those about London. There are people who think that to write is characteristic of the non-practical man, but such an opinion was not justified by the case of Thomas Baines, because he was a voluminous writer for the garden press and wrote an excellent book on stove and greenhouse plants, which is indeed the standard work on a subject he knew so well. He was extensively engaged in laying out gardens, and amongst other large places which he planned, or greatly altered, were Glansevern, Montgomeryshire; Claughton-on-Brock, near Preston; Waddesden, Claoombe, Banbury, Broxbournebury, Boxley and Munden Park, Herts; besides many minor places. Mr. Thomas Baines was a Lancashire man, his people having been stewards and gardeners among the old estates there for many generations. He was seventy-two years of age, and was buried on Thursday last in the Great Northern Cemetery, Old Southgate.

1895.

THE GARDENS AT TILTWOOD, CRAWLEY DOWN.

Interview with Lady Barbour.

IN the amazing development of horticulture during the last decade, nothing has been more pleasing than the growth of personal interest taken by the owners, or wives of the owners, of gardens of considerable extent. In many cases there is more than interest; there is personal knowledge, supported by enthusiasm, and this is turned to the best possible account. At Tiltwood, the delightful residence of Sir David Barbour, K.C.S.I., K.C.M.G., on Crawley Down, the management of the gardens is literally undertaken by Lady Barbour, who has done much to make them beautiful. She was good enough, on a lovely day in June, when the Roses were beginning to come into evidence, to show me her fair domain. It is a domain, too, which is not put in order for a period, and then allowed to languish, but is carefully tended all the year round. And Lady Barbour finds in her gardener, Mr. Baker, an able employee, who carries out her instructions with skill. In going round the gardens, the first feature to attract my attention was what Lady Barbour calls "Primula Corner."

"For years," she said, "this was a corner where nothing would grow. Then we decided the year before last to go in for Primulas and Ferns, and see how they would do in this shady, moist position. You can see that the result has been encouraging. Now we have Primulas in succession, rosea, japonica, Cockburniana, and Sikkimensis, with others. The Grape Hyacinth also thrives here in the early spring, and the Gentiana verna when there is the maximum of sun. The Ferns last through the summer, and the Primulas keep their leaves until late in the winter; then they die down."

"Their appearance at the present time shows that they have found a home to suit them."

The Flower Rock Garden.

One of the principal features at Tiltwood is the flower rock garden, which is approached by a shady path, and is in an ideal situation. This was designed by Lady Barbour, and has for a background a plantation of Laurels, with a belt of Scotch Firs; while in front is a charming Rosery.

Observing that the Rock Roses contributed a very bright element in the sunny border, I enquired the names of favourite varieties.

"Helianthemum carminatum plenum, H. mutabile, H. Attraction, H. roseum multiplex, all bright and attractive Rock Roses. Other favourite rock plants are Arenaria montana, the close-growing Thymus serpyllum alba, and Thymus citriodorous argentea. Another favourite, because of its glossy foliage, is the Waldsteinia trifolia. I occasionally add to the collection by plants which I pick up in travelling. A recent addition is one of the Balms, which I brought from Switzerland, and it promises to flourish. Lithospermum purpureo-cœruleum, now in flower, is in its element, and early in the year Trillium grandiflorum and sessile californicum are at home. Omphalodes verna, with its pretty blue flower, also takes kindly to the soil in the spring. Sometimes the slugs are troublesome."

"Have you discovered any effective remedy?"

"I have been powdering the border over with Sanitas, and it has done some good. Besides the varieties mentioned, there are a very large number of beautiful Alpines."

Roses for Arches.

The Rosery next claimed notice, and I was much impressed with the splendid blooms of Gruss an Teplitz on a fine arch across the centre of the Rose garden.

"Gruss an Teplitz," Lady Barbour said, "should be more used for arches. It is well recognised as a good Rose for general purposes, but as a climber it is not so much known as it merits. The other varieties are Jersey Beauty, Gardenia, and Crimson Rambler—all white one side of arch, and red the other.

THE LAKE AT TILTWOOD.

"Do you group the beds in colours?"

"Yes, that is the plan. Some beds are mixed, as, for example, Madame Abel Chatenay—one of the best Hybrid Teas—with American Beauty, Viscountess Folkestone, and Baroness Rothschild. There are beds of Lady Battersea, and Caroline Testout. The mixed beds one side of the arch include such combinations as Augustine Guinoisseau, Captain Christy, and Mrs. John Laing; Kaiserin Augusta Victoria, Killarney, and Lady Battersea; a long bed with Gloire de Margottin, Suzanne Marie Rodocanachi, Marchioness of Lorne, Louis van Houtte, Duchess of Albany, and Grace Darling; Francisca Kruger, White Maman Cochet, and Souvenir de Catherine Guillot."

"I should like to know, please, the varieties for which you have the most regard?"

"I am extremely fond of Killarney, Lady Battersea, Madame Abel Chatenay, and Louise van Houtte. The last is a special favourite, and a most beautiful Rose. There are other varieties which thrive in different parts of the gardens, as well as some in the Rosery."

"Do the Roses require much attention?"

"The green-fly is a troublesome enemy, and syringing has to be done constantly to prevent its ravages."

Through a refreshing Fernery, in the woods which form the boundary, with a large collection of hardy Ferns and London Pride growing luxuriantly, we proceeded to inspect the bedding on the terrace.

The Terrace Bedding.

"What was the spring bedding here?" I asked.

"Polyanthus in the smaller beds, masses of Forget-me-nots, and Blood-red Wallflowers in the centre, and double white Arabis. In one bed the Forget-me-nots formed a groundwork for the Azaleas, and in others there were masses of Daffodils. For summer bedding, Geranium Paul Crampel and Nicotianas are largely used, and the line of Roses on cords consists of Lady Gay, with Dorothy Perkins forming beds of creeping Roses, supported on short stakes. There are also beds with scarlet Alonsoas on one side, golden Calceolarias on the other, and blue Heliotropes in the centre. I just choose what I think will look pretty, and vary the combinations as often as I can."

"One of the prettiest of your flowering shrubs is the Kalmia, and I notice that Carmine Pillar is flowering splendidly as a weeping Rose."

"The other weeping trees on the lawn are Dorothy Perkins, Queen Alexandra, Dundee Rambler, and Blush Rambler."

"Then there is the other corner bed with a number of flowering shrubs, amongst which a lovely Magnolia is conspicuous."

"The variety is M. obovata. The other shrubs include varieties of Broom, Forsythia suspensa, the flowering Cherry and Peach, pink Acacias, white Weigelas, and American Azaleas, which, as you see, flower abundantly. A specimen of Buddleia variabilis is worth mentioning."

"And, not least, the magnificent show of Rhododendrons, principally in clumps on the north side of the house."

"The Rhododendrons have been very fine, but, of course, they are going off now, and the Azaleas have gone, though in their places Liliums are coming on.

A Border of Climbing Roses.

"Now I will show you a border of Roses planted last autumn from our own cuttings. It forms a border to the orchard, and faces south. The varieties are Lady Gay, Blush Rambler, Felicite Perpetue, Euphrosyne, Crimson Rambler, Leuchstern, and Waltham Beauty. Sweet Peas were originally grown here, but they got tired of the soil, and we started Roses."

"They have certainly made a wonderful growth in a short time. How large is your orchard behind the Roses?"

"About an acre, but the soil does not suit fruit; it is too poor."

"Have you any name for the pretty garden we are now approaching, with a border on each

Original from CORNELL UNIVERSITY

side of the grass walk, and a pergola running the whole length?"

"We only call it the wall border. One of the features is the pavement near the seat at the end, which is planted with a collection of Alpines, such as pink and white Dianthus, encrusted Saxifrages, Campanulas, and Phloxes in variety."

"In one of the big borders I notice the scarlet of Oriental Poppies is exceptionally brilliant."

"Yes, it is very flaming. In the border are also Doronicums, yellow Irises, Centaureas, Evening Primroses, Michaelmas Daisies, herbaceous Lupins, a few Pæonies, Valerians (red and white), and Tellimas, which give very fine foliage effect. Amongst the plants of dwarfer growth are Violas and Aquilegias. Then there is the wall itself, with a very pretty Polygonum Baldschuanicum coming into flower at the far end. At this end great Fig trees cover a considerable portion of the wall, with their very effective foliage, though they give little fruit, except in very sunny years; and on other parts of the wall are Carpentaria, Choisya ternata, Ceanothus Gloire de Versailles, C. azureus, Lonicera fragrantissima, Akebia quinata, and Forsythia europea. Near the wall are two plants of Gum Cistus, which flower remarkably well. You may like to know that when Shirley Poppies are in flower, we pick them for table decoration, and they last well for a couple of days."

"I should like to know the names of some of the Roses on the pergola."

"In addition to those you have already had, there are Aimee Vibert, Marchioness of Turin, Madame d'Arblay, Gruss an Teplitz, Conrad F. Meyer, Austrian Brier, Tea Rambler, Aglaia, Debutante, and Rosea alpinus, which has a pretty red stem in the winter. There is double white Clematis at the end of the pergola, but it is practically confined to Roses. Near a corner lately planted, confined to shrubs and Roses, is the new Sweet Pea quarter."

"Of which I see you grow all the leading favourites."

"Adjacent to the Sweet Peas is a clump of German Iris, to be followed by Spanish and English, with Violas Florizel, and Aubrietia græca in front. I think the English Iris the more effective."

Flower Beds in the Grass.

Passing through the kitchen garden, we looked into the Vineries, which consist of early, second, and late houses, the varieties in the first being Black Hamburgh and Madresfield Court; and in the others, Muscat Hamburgh, Madresfield Court, Black Hamburgh, Muscat of Alexandria, Mrs. Pince, Lady Downe's Seedling, Alicante, and Frankanthal Hamburgh. Commenting on the flourishing appearance of the Vines, and the promise of heavy crops, I asked, when we reached the front of the house, whether the beds on the grass were recently made.

"They were made," replied Lady Barbour, "soon after we came here, eight years ago, and many of them are filled with Hybrid Perpetual and climbing Roses, such as Trier, Hiawatha, and Minnehaha. There are also beds of herbaceous Lupins, and a large bed is filled with a good collection of Show and single Dahlias. The singles were raised here. Other beds contain Spiræas in variety; Tree Lupins (white and yellow); and American Maples, which find the position very congenial. The tubs standing outside are filled with Agapanthus and Hydrangeas. In the spring, yellow Polyanthus contrast pleasantly with the dark foliage of the trees, and Daffodils in thousands are naturalised."

THE WALL BORDER AT TILTWOOD.

TILTWOOD, CRAWLEY DOWN.

"You have some fine specimens of Cupressus Lawsoniana."

"The position and climate also suit Picea Nordmanniana, Wellingtonias, Copper Beeches, and Chestnuts. There is nothing to note on the house itself, but Ampelopsis does well on the portico, and the Wistaria on the verandah makes a lovely show, with its glorious blooms."

The Conservatory.

Lastly, we went into the conservatory, a very commodious and lofty building.

"Here," continued Lady Barbour, "the contents for the most part change with the changing seasons, but Bamboos are planted in the soil, and other permanent tenants are the Palms, the Ginger plant, Ficus repens, Rhyncospermum jasminoides, Swainsonia, and the Asparagus creeper."

"During the progress round the gardens, I have not noticed any Carnations."

"The soil is too heavy for them. For table decorations, we use principally light, graceful flowers—Sweet Peas with grasses, Iris with grasses, or Shirley Poppies with grasses. London Pride is combined with Ivy-leaved Geraniums, or with Cerastium tomentosa. Other table combinations are Erigeron Villarsi with grasses, and the wild, pale mauve Orchis (spotted), Ox-eyed Daisies with quaking grasses, or Maidenhair Ferns with white Geraniums."

ALFRED WILCOX.

THE gardens of Colonel Rogers, D.S.O., at River Hill House, Sevenoaks, will be described next week.

The Amateur's Frame.

VI.—CUCUMBERS IN A FRAME.

HAVING described the making of a hotbed, we may now profitably consider to what uses it can be put. One of the most popular uses is to grow Cucumbers in it. Let it be said, however, that if Cucumbers are to be grown, the frames should be given over to them entirely. They should be the dominating feature, so that all other plants have to fall in with the treatment accorded to them; or a slate or wooden division should be formed, so that one light may be used for Cucumbers, and the other for other purposes.

Getting the Plants Ready.

We will presume that the reader has no means of raising the Cucumbers except by the frame. If he has a propagator in his greenhouse, or is prepared to buy the plants when they are ready for planting, his task is less difficult; but there is no valid reason why he should not raise his own seedlings. For this purpose, it is advisable to make up the hotbed in January, so that it may be used for seed-raising in February, the early part of which month would be a good time for putting in the pips. Until the plants are large enough to set out, the frame can thus be employed for the propagation of many plants from seeds and cuttings.

The seeds should be procured from a reliable seedsman, and should be sown singly in 2-in. pots. Ordinary sandy soil, free from manure,

Original from CORNELL UNIVERSITY

is best for the purpose. Having filled the pots and firmed the soil, make a hole with a setting stick, and put in a little silver sand. Next put in the Cucumber pip, and then more silver sand, so that the pip, being enveloped in sand, is not likely to rot.

The next thing is to fix a handlight, or the frame of a box, in the frame, to put cocoanut fibre in this, and to plunge the pots of seed-

THE CUCUMBER FRAME.

lings, after they have been watered and have drained. Cover the box or handlight with a sheet of glass, and shade with paper until germination takes place. At this stage the sheet of glass should be tilted up, and the paper removed. Later, they may be transferred to the open frame, and gradually worked to a position where they will have the advantage of what air is admitted.

When the rough leaf is formed, the young plants may be advanced to a 3-in. pot, and when this is nicely filled with roots, a further shift to a 5-in. pot will be needed. From this size the plants may be set out when they have made a fair network of roots.

Planting the Cucumbers.

When the plants are sufficiently advanced for setting out, a bushel of soil is set in the middle of the frame. This may consist of two parts loam, one part leaf-soil, and one part Mushroom manure, well mixed together. It is better not to firm the soil, but to leave it for a day to become warm before the Cucumbers are planted. I would advise that two plants be set in each light, and one be trained towards the top, the other towards the bottom. A hole may be made with the hand, and the ball of soil be just covered, but the soil must not be made firm.

After planting, it may be necessary to shade the plants from sunshine. A careful eye should be kept on them to prevent scorching, but the shading should be discontinued as soon as possible. A light dewing over with the syringe when the leaves show a tendency to flag will often bring them upright again, and admit of the shading being dispensed with.

Training the Cucumbers.

There is no great difficulty about the training of Cucumbers. Planted in the centre of the frame, they may have their points pinched out as they approach the top and the bottom. The side growths may be pinched back when about a foot in length, and after that the growths may be stopped at the first or second leaf beyond the fruit. As the growth becomes entangled, and occupies the whole frame, it will be necessary to thin it out, leaving young growths near the centre in preference to others farther away.

Occasional top-dressings of soil similar to that in which they were planted will be needed as the other becomes exhausted, and at no time should the plants be reduced to such an extremity as to flag for want of water. Syringing should be done both morning and evening. The method of ventilating a hotbed frame will be given in a subsequent article.

The Illustrations.

Fig. 1 shows a pip or Cucumber seed put into a 2-in. pot, with the seed surrounded with sand.

In Fig. 2 we have a plan of a frame showing the position of the soil, and the direction in which the plants will be trained.

A section of the frame in Fig. 3 shows again the position and depth of the frame, and the position also of the propagator used for raising the plants. WILLIAM F. ROWLES.

GARDENING EXPERIENCES.

A free subscription for one year (value 6s. 6d.) will be given each week for the most interesting and useful contribution to this page. The contribution must be original, and should, if possible, be descriptive of the writer's gardening practice.

The prizewinner this week is F. P. Mains.

A RARE PLANT IN KILMARNOCK.

A RARE plant in the conservatory at Bellfield Gardens, Kilmarnock, is this summer in flower. This is the Doryanthes, the so-called Century Plant. This is the first time any of the species has been known to attain to maturity in Scotland (so far as I can find out), and probably only the second time in Britain. So recently as 1909 there was one which flowered at the Royal Gardens, Kew, which was exhibited at that time at the Temple Show.

Fig. 1.—A SIMPLE COLD FRAME.

This noble plant is commonly called the Spire-flower, or Queensland Lily, although, strictly speaking, it is not a Lily. It belongs to the natural order Amaryllideæ, and its botanical name is Doryanthes excelsa. It is a native of Australia. The plant does not flower until it reaches maturity, which it may attain in from twenty to forty years, according to treatment.

Striking Proportions.

The flowering stem of the plant is nine feet high, and it bears its flowers in a spike measuring three feet high and seven inches through. The individual flower is an inch and a-half in diameter, with three petals and three sepals, two and a-quarter inches long. These are a dull carmine colour, with a creamy centre. Clusters of from six to nine flowers are borne in the axil of a long, leafy bract, each individual flower being subtended by a smaller brownish bract. The numerous dark-green leaves which form a rosette or tuft at the base of the plant are lance-shaped, about six feet long and six inches wide.—F. P. MAINS.

A NEW GARDEN FRAME.

WE are constantly reading in GARDEN LIFE descriptions of very beautiful flowers, which arouse the enthusiasm of every amateur gardener, who at once has visions of gorgeous additions to his own floral display. Cultural directions are, as a rule, given, and often these words appear: "Seeds must be sown under glass." At this point enthusiasm receives a check, as in many cases amateurs have no available glass. Now the ordinary garden frame, although an excellent addition to a large garden, is somewhat cumbersome and occupies too much space in a very small garden. It also has the drawback of not being portable, and generally has to remain in one spot, which is often anything but the most suitable position in the garden.

Description of a New Frame.

Fig. 1 illustrates a small frame which is portable, and can be easily moved either to a sunny or a shady position as occasion requires. In the winter months there is very little use for a frame in a small garden, and it is often in the way. The great advantage of this frame is that it can be folded up (Fig. 2) when not in use, and put away in the tool shed, or any place out of the way. The pieces forming the base at the two ends are detachable, and the glass is easily removed. The framework then folds over by the three hinges on the top.

It is three feet long, twenty-one inches high, and opens out to twenty-six inches, but can, of course, be made to any dimensions required. The top and bottom rail are three inches by one inch, and the side pieces one and a half inches by two inches, tapering at the top to one and a half inches by one inch.

The top rail has a groove on the underside to receive the glass, and the side and bottom pieces have what a carpenter calls a rabbet, but which to the uninitiated only means a small portion cut out of the framework to take the glass. The two base pieces at the ends are fitted with brass ear plates, bent to fit the angle, with a slot cut in the circular portion (Fig. 3). A screw (not quite driven home) is put into the framework, and this slides into the slot cut in the ear plate. This fitting holds the two pieces firmly together, and allows them to be easily detached.

The glass is kept in position by small wooden buttons, or small pieces of pliable lead, attached by a screw. I prefer the latter, as they can be pressed close to the glass and keep it firm. The disadvantage of lead is that it may break off if moved backwards and forwards many times, but it is really only necessary to move these pieces when fitting the frame together, and consequently they remain intact for several years.

Great care must be exercised in ventilation, as it is most essential if strong seedlings are to be raised that they should get an abundance of air. If the centre piece of glass is removed, and

placed as shown in Fig. 4, this will allow plenty of air to circulate in the frame, and it can, of course, be closed at night or during inclement weather.

The frame described will assist anyone to make interesting experiments in floriculture, and it is especially suitable for small experiments in French gardening, about which we have heard so much during the last two years.—J. H. MORTON.

THE GARDENS AT GREENFORD GREEN, HARROW.

Interview with Mr. G. Baldwin.

AT the twelfth exhibition of the National Sweet Pea Society this year, the third prize in the Henry Eckford Memorial class was awarded to Mr. A. W. Perkin, of Greenford Green, Harrow for bright, clear flowers of well-known varieties. The gardener at Greenford Green is Mr. G. Baldwin, and under his auspices I went round the gardens, when the Sweet Peas were giving promise of the signal success they have since achieved. Greenford Green is a great surprise to a stranger, who sees nothing remarkable in the commodious house close to the road, but on entering the gates, quickly obtains a vista of the beautiful and extensive pleasure grounds lying behind. Adjacent to the house is a large conservatory, and here I stayed to admire a fine display of Pelargoniums, which, in the middle of June, had been in flower for five weeks, and gave promise of continued blooms for at least another fortnight.

"The varieties represented," said Mr. Baldwin, "are pink, scarlet, Picotee-edged, and white, but I do not know their names. They were here when I came. I cut them back at the end of August every year, and grow them under the coolest possible conditions. We are never troubled with green-fly. One plant always has pink and white flowers. Facing the Pelargoniums are Ferns, and on the wall behind Streptosolen Jamesonii. There is nothing much in the front, except a few Paul Crampel Geraniums on either side of the house; the Yuccas flowering for the first time, and a good specimen of Cedrus deodara."

"There are some wonderful specimens of Portugal Laurels," I said, as we surveyed the charming prospect from the terrace.

"They date back nearly half a century, the time when the house was built. I always trim them myself. Portugal Laurels are only worth having if they can receive constant attention. The four Golden Yews near them are also considered exceptionally good specimens, both as to colour and shape. The Acer negundo does well."

Combinations of Bedding.

"What is the arrangement of the terrace bedding?"

"Two of the four beds are filled with double white Geraniums; the other two with Geranium Henry Cannell (pink), and dot plants of Abutilon Thompsonii, edged with blue Lobelia Kathleen Mallard, which flowers profusely, On the terrace steps are Agapanthus in tubs, all blue but one. There are twenty spikes of flower in a single tub. The two dozen vases contain Marguerites, Geranium Charles Turner, and Lobelia speciosum."

"The soil must be particularly congenial to Yews."

"Yes, the two table-shaped Yews on the lawn, closely clipped, point to that conclusion, and the Golden Yews supply further evidence. In order to affect a contrast in colour, we have grafted Golden Yews on to the Irish Yews."

"I see that you have a big show of Paul Crampel in the long beds below the terrace."

"They are the groundwork, and the edging is made up of Lobelia Kathleen Mallard and Alyssums. In the centre of the three round beds is another Acer negundo, which is pruned drastically every year to keep it small. Underneath are Alternantheras in variety, and Sedum glaucum. A dash of colour is provided on the tennis-lawn by a Rose, Dorothy Perkins, growing up a stump of a tree twelve feet high."

GREENFORD GREEN, HARROW.

"Speaking of colour, blue and yellow are admirably represented by the Spanish Iris."

"Nothing gives a better return for money than the Spanish Iris. Every bulb throws up a good flower. There are good varieties in the Rhododendron bed, but the very heavy clay soil does not suit Rhododendrons. The soil for them has to be made."

"The lawn is ornamented by some noble Elms."

"The shade underneath them is a favourite spot. Amongst other notable specimens of trees are two Weeping Elms in a flourishing state. There are three more beds on the great lawn, with Geranium Henry Cannell, Maize in quality, and Centaurea ragusina, edged with blue Lobelias."

"The pleasure grounds must occupy a considerable amount of space."

"About six acres. On the left of the lawn are five large arches of climbing Roses, Mrs. Flight and Dorothy Perkins, which do better in that position than any others; and on the right is a border of clipped shrubs. Crimson Rambler affords brilliant cover for two more arches further on; and Dorothy Perkins is useful as a standard in the centre of two beds, with groundwork of Verbena Miss Willmott. Mrs. Perkin likes this combination so much that we have had it for three years in succession."

"There are some nice specimens of Pinus excelsa in a corner of the lawn."

"They are in the best of health now, but, at one time, they were apparently dying. Then I top-dressed them, and they have thriven ever since. I attribute the appearance of the lawns to the fact that they are mown regularly and top-dressed in winter. With the croquet court, there are three lawns, and beyond the third is an addition which we made in 1907. I mean the Rose garden, which was taken out of the paddock."

"A remarkably pretty paddock, by the way."

"Yes, though it intervenes between portions of the pleasure grounds, it does not spoil the effect. In the Rose garden there is one big bed, with two long beds at the side, and four diamond-shaped. The two varieties in the two long beds are Madame Jules Grolez and Hugh Dickson. In the four diamond are respectively The Lyons, Madame Abel Chatenay, Madame Jean Dupuy, and Maman Cochet, with a weeping standard Rose at the end of each. The big bed has three standards in the centre, and contains about sixty bushes. The standards are Caroline Testout, and the others are mixed, chiefly Teas and Hybrid Teas. The only Hybrid Perpetual is Frau Karl Druschki. There are several fruit trees on the grass here. We did not disturb them when we took in a part of the paddock."

The Herbaceous Border.

Proceeding round the paddock, I noticed more Rose beds, including one of Leoni Lamesch, another of Mrs. W. J. Grant; and Climbing La France and Charles Lefebvre were also in evidence. Thorns of all colours, a big clump of Wellingtonias, clipped and pruned shrubs, adorn this section of the shrubbery; and at length we reach a striking herbaceous border, forty yards long.

"This," continued Mr. Baldwin, "used to be a hedge of Aucubas. In making the herbaceous border, I took care to keep the perennials together, and avoided the plan of dotting plants here and there. Among the decorative flowers are Agrostemmas, Achillea, Sweet Williams Scarlet Beauty, Delphiniums, and many others. There are more clipped trees behind, notably two bottle-fashioned Yews."

"Between the herbaceous border and more Rose beds, there is scope for a splendid rockery."

"You mean by the pond with the goldfish? But the rockery has yet to come. The Roses here are Hybrid Perpetuals, purposely planted to give late flowers. Encircled by a Yew hedge is a bed of Pentstemon Newbury Gem."

"That is one of the many surprises of the garden, and the south border beyond is another."

"The double border marks the termination of the pleasure grounds. It is made as gay as possible with Roses, Sweet Peas, Border Carnations, Pæonies, Dahlias, and various

Digitized by Google Original from CORNELL UNIVERSITY

annuals. Facing these are Iceland Poppies backed by cordon fruit trees. Amongst the Roses are Gustave Regis, Waltham Climber, and Louis von Houtte. But we likewise aim at making the kitchen garden ornamental."

"Beginning with a lovely arch of Roses, and glimpses of glorious Sweet Peas."

The Sweet Peas.

"The Rose is Mrs. Flight. Sweet Peas, as you may judge, are a great speciality. They are so much my hobby, that I cultivate them in my own time and do not allow any one else to touch them. I sow the seeds, and I cut the blooms for showing."

"Are they planted according to colour?"

"Yes, and I think that all shades of colour are represented. The varieties are not numerous, but great care was taken in the selection of them. They are May Campbell, Elfrida Pearson, Mrs. Hugh Dickson, Sunproof Crimson, Mrs. C. W. Breadmore, Elsie Herbert, Lady Knox, Dorothy, Nubian, Mrs. Cuthbertson, Mrs. Heslington, Clara Curtis, Etta Dyke, John Ingman, Marjorie Linzee, Melba, Edrom Beauty, Charles Foster, Thomas Stevenson, and Earl Spencer."

"Can you tell me the length of the stems?"

"Some of them are quite twenty-two inches long, and the haulm is an inch in width. Each row is twenty-eight yards long, and has seven varieties in blocks of one colour. The height is nearly eleven feet. The foliage runs down to the ground, and I attach as much importance to it as to the flowers."

[Mr. Baldwin has since been first at Uxbridge and winner of the silver medal for the best bunch of Sweet Peas in the show.]

"Another delightful feature of the kitchen garden is the Rose walk."

"There are not only Roses, but the centre bed, containing Kochia tricophylla, with angles of Nicotiana affinis and Fuchsia Mrs. Marshall, adds very much to the effect. The two rows, ten yards long each, contain varieties requiring a shaded aspect. The colours are orange and salmon, all on the exhibition principle. Of all the Roses there is none, I think, to surpass Caroline Testout. One plant which I pruned back to three buds for some years, has a head with quite fifty blooms, and as soon as one crop of bloom is over, we get another. There are about a dozen plants of Caroline Testout, and the other varieties are mixed, the whole of the border consisting of Violas. Now, I think, we might take the range of houses, beginning with the Cucumbers. We commenced to cut these on March 6th, and continue to get a crop up till Christmas. For early and late purposes, we grow Blair's Prolific, and for main crop Telegraph. The Melons are the Canteloupe and Sutton's A1. In the stove house the principal plants are Caladiums, Allamanda Hendersonii, Begonia President Carnot, Eucharis, a nice piece of Asplenium nidus, also good Crotons."

"You have been very successful with Grapes," I said, as we entered one of the Vineries.

"Yes, we had the good fortune to win two seconds and a third prize at the International Show this year. The Grapes shown were Foster's Seedling and Black Hamburgh, which are grown in this house. We were second to Lord Salisbury, and, as you know, the gardens at Hatfield are on a very big scale."

"Have you shown Grapes much before?"

"Only locally, but we had been first or second at Ealing, Harrow, Richmond, and Hanwell. I can assure you that the competition at the local show is very keen."

(Mr. Baldwin has since added to his triumphs by taking three prizes with four exhibits, one first and two seconds at Richmond.)

"When does your Grape season begin?"

"For eight years the usual date has been May 18th, and never later than May 20th. For feeding, we rely entirely on farmyard manure and good wood ashes. The other variety in this house is Madresfield Court. In the late house we have Alicante, Buckland's Sweetwater, and Black Hamburgh, just showing colour, and these prolong the Grape season, as a rule, to Christmas. I am starting now to replant Lady Downe's Seedling, Appley Towers, and Lady Hutt. The borders are all inside."

"I see you go in for Gloxinias?"

"That is what I call one of my eight specialities."

Gloxinias and Lantanas.

"And the other seven?"

"Begonia Gloire de Lorraine, Cinerarias, Primulas, Schizanthus, under glass; and outside, Sweet Peas, Roses, and Onions. With regard to Gloxinias, these are but the remains. I thought of showing them when they were at their best at the International, when many plants had sixty to seventy blooms on them. Forty is quite a common number. They are chiefly my own hybrids, and the flowers are not only large and bold, but delicate in colouring, with characteristic foliage. Here are some Lantanas, which have a very long-flowering season, lasting from February to November. Ferns are represented by Adiantum concinnum, and Platycerium alcicorne."

MR. G. BALDWIN AND HIS SWEET PEAS.

"Have you more than one Peach house?"

"Yes; two. The one we are entering is the earlier house. The varieties include Nectarine Violette Hative. The Peaches crop well, and here, again, I use no artificial manure. The Peach season lasts until the end of September. We shall come to the late house presently. The next is devoted to Ferns. The varieties are chiefly of the Adiantum section, and we use them largely for table purposes. There is a big tank underneath this house, and in the winter I grow all my bedding stuff there. On the shelves above are my Cinerarias, stellata and single. I have a pan of Sutton's new scarlet Cinerarias, which was sown on June 1st. I make only one sowing, grow one hundred and twenty, aim to get them in flower during February, and to keep them so for a month. The Primulas are chiefly of the stellata type. I sow for the middle of May, and grow them here till they take their second shift. They go out in pits, the lights being kept off all night until September 20th, unless the weather is too cold. In the Rose house, Le Perle de Jardin flowers three or four times in the season; this is the third time."

"How many trees are there in your cool Peach house?"

"Ten. The trees have not been planted many years, and in order to save space, they were planted back to back, with a distance of five feet between. Hale's Early is the only early variety, but Royal George, Barrington, Princess of Wales, Sea Eagle, and Stirling Castle are planted in pairs. Along the front are Tomatoes, Lister's Prolific, the best Tomato ever raised for cropping and shape. I also grow in this house early Lettuce, Cabbage, and Cauliflower, for planting out of doors afterwards. In the Begonia house the plants are all seedlings, singles and doubles, about one hundred and fifty; while on the shelf there are six dozen of the Lorraines. On the stage are also Poinsettias, just potted in 'forty-eights' pots."

"Do you grow many Orchids?"

"Only a mixed lot, such as Lælias, Cattleyas, Cypripediums, Dendrobiums, and three dozen Calanthes Veitchii. Then there is another house full of Geraniums, which are grown for filling up the conservatory; and a house for Tomatoes. The varieties, in addition to Lister's Prolific, are Carter's Sunrise, and Sutton's Satisfaction. Of Tree Carnations we have about one hundred and fifty, the cream of the collection being Rose Dore, Enchantress, Winsor, Harlowarden, Rose-pink Enchantress, Beacon, and Lady Bountiful. We have about two hundred and fifty Chrysanthemums, a hundred for large blooms. They include all the best and latest varieties. Under the Yew hedge just outside the houses we grow Tagetes signata pumila. I sow the seed in boxes during March, and it flowers before July, yielding a wealth of golden bloom. The seed can safely be sown out of doors."

Hardy Fruit.

"You have a good collection of hardy fruit?"

"The fruit in the Orchard consists of old standards, the best varieties being Blenheim Orange, Cox's Orange Pippin, Wellington, Fearn's Pippin, Adam's Pearmain, Lord Burghley, Lemon Pippin, Stirling Castle, and Lord Derby. The Pears are Brockworth Park, Williams's Bon Chretien (extra good), and Louise Bonne of Jersey. On the fence surrounding the orchard are Pears and Apples on cordons. The former are Beurre Rance, Beurre Easter, Beurre d'Amanlis, and Marie Louise; the Apples, Golden Spire, Lady Sudeley, and Sturmer Pippin. We grow several varieties of Plums, namely, Rivers' Early Prolific, Victoria, Kirke's, Coe's Golden Drop, Green Gage, Deniston's Superb, and Monarch."

"What about Strawberries?"

"The only three varieties are Royal Sovereign, Waterloo, and Le Gros Sucre, the best of the three. The Raspberries are Superlative. Until I came, there was none grown here, and last season I picked a bushel off one row. Currants on cordons do well."

"I need hardly ask whether Onions do well, unless their appearance greatly belies them."

"Yes; I always try to make most of my eighth feature. The spring-sown Onions are Ailsa Craig and Sutton's A1. I finish using these in June, and for autumn sowing I use Sutton's White Leviathan. Early Gem, Favourite, and a new Red Intermediate supply a fine bed of Carrots; and last year the Runner Beans were one of the sights of the kitchen garden. They were fifteen feet high, and I could have picked a bushel off one row at any time. The varieties grown are Best of All and Prizewinner."

"You have not mentioned your six rows of Peas?"

"There are five varieties, Early Giant, Sutton's Magnum Bonum, Sutton's Perpetual, Duke of Albany, and Gladstone. We only grow Potatoes sufficient for summer use, but between the Raspberries and Sweet Peas there are three very fine Asparagus beds. A quantity of Seakale is grown for winter forcing."

Mr. Baldwin's Career.

"How long have you been in charge of these gardens, Mr. Baldwin?"

"Since November, 1904. I spent the first seven years of my gardening life in general work near Southampton and Newbury. I was then for two seasons at Harleyford, near

Digitized by Google Original from CORNELL UNIVERSITY

Marlow; and next I proceeded to North Wales, and was foreman at Penbew Hall. My first appointment as head gardener was at Dane End House, Hertford, and after I had been there two years, I came to Greenford. I have been showing here for six years, and have nearly two hundred prize cards, chiefly for decorative plants, fruit, and Sweet Peas. I have never been beaten at Richmond for Sweet Peas. I take an interest in questions affecting gardeners, and am chairman of the Harrow Gardener's Mutual Improvement Association. I also belong to the Ealing Association, and I am quite sure that it is an advantage for young gardeners to belong to an organisation of this kind."

ALFRED WILCOX.

NEXT week we shall publish an interview with Mr. Charles Shea, F.R.H.S., of The Elms, Footscray.

SUMMER PLANS FOR GARDEN IMPROVEMENT.

PLANS are of two kinds—those which exist in the mind only, and those which are drawn out on paper. But the flower-lover who sees that his garden will bear improving would do well to think out the best methods and also sketch them. Vague ideas are of little service; only by accurate knowledge of the garden's measurements in all places, of the play of light and shade, and the warmth or coldness of different aspects, can the finest use be made of a small plot or of a large expanse.

Study the Soil.

Streaks of soil occur very frequently, and make a vast difference to the plants that are set in them. A man will call his garden ground heavy or sandy, as the case may be, but omit to notice that one shady border has a stiff tract of clayish loam running across it, while a sun-scorched bit of bed elsewhere is cracking and hard for the same reason. In the shaded portion pansies would revel, in the sunny one they would dwindle and pine—a mere illustration this of the art of making use of natural opportunities, and avoiding errors.

A map to scale is not so difficult to make as the idea sounds. A tape yard-measure has each inch divided into eight portions, and the size of one of these may be taken to represent a foot. Let the outline of the garden be measured thus, and marked lightly in pencil on a sheet of drawing-paper. Next the curves, bays, passages, paths, lawns, and any sheds or other buildings should be measured and accurately marked off upon the plan. By degrees, with careful work, each little winding walk, every hedge, shrub-group, or Rose tree will be visibly noted down. As soon as the plan is successfully completed as to detail, a sheet of glazed, untearable, transparent paper should be pinned over it, the two held up to a window, and the lines drawn on the outer paper in pencil, then gone over, on the flat, in ink. The rough plan will always be useful to mark alterations upon without risk of injuring the other.

Avoiding Stiffness.

A round flower bed in the middle of a long, narrow lawn, quite takes off the stiff angular look of a small garden. An edging of Pinks will look well all the year round, and the gray of their foliage will form a pleasingly distinct line between turf and other plants. A fine standard Rose tree makes the best centre-piece, unless there is space for a pillar Rose, and further height is desired. If there is a belt of Violas inside the Pink edge, it will be advisable to leave the rest of the bed to fill with bulbs for spring, then with summer bedders, as, by this means, the gayest effects are gained.

Long, straight borders have a way of looking dreary after summer droughts have stopped the blossoming of the earlier perennials. Note should be made of the especially bare portions, and groups towards the foreground can be thought out for adding in October. These should be of some persistent blooming herbaceous subjects, such as Snapdragons or Gaillardias, or else of varieties of Michaelmas Daisy, or early Chrysanthemums that are advertised as beginning at the requisite season.

Flowers for August.

Beautiful August colour results from a combination of Eryngiums of steely blue and silver and orange-vermilion Montbretias, which bloom together invariably. Phloxes, too, are especially valuable for brightening gardens. They will flourish in full sun, although so admirable in shade, if given deeply dug, rich soil, and mulches of old cow manure, with water when necessary.

Waste portions of shady walls or palings should not be left unadorned. They will show up now as bare stretches among the gorgeous flower and foliage show of summer, so are easily noticed. Suitable subjects to plant against them in two or three months' time are Loganberries, or any of the cultivated Blackberries, which are so beautiful in blossom, as well as fair and palatable as to fruit. Virginian Creeper, the Common Hop, or Ivies can be chosen if preferred.

HOBBY GARDENER.

A COOLING DISH FOR HOT DAYS.

By permission of Messrs. Webb & Sons, Wordsley, Stourbridge.

FRAME CUCUMBERS.

MANY amateurs utilise the spare garden frame from April onwards for the production of home-grown Cucumbers, but although old stagers usually get results which fully compensate them for the initial outlay on plants and manure, it is an open question if the ordinary amateur gets anything near the number of good fruit a plant is capable of producing, and invariably does produce, when well managed.

The trouble with many is that the supply is fast and furious for a time, but there suddenly comes a lull, and the handsome fruits of early June are no longer forthcoming. Indeed, if there, we get short, stubby specimens, more often than not in the shape of a horseshoe, while others, which try to grow straight, start off fairly well, but finish up very badly, the last two or three inches of growth being thin, and out of all comparison to the tail, and, in appearance, are more suggestive of pot-hooks than Cucumbers—specimens which no self-respecting amateur can possibly find pleasure either in giving away or using at his own table.

Rejuvenating the Plants.

It does not follow that plants such as these are beyond all hope, for with a little patience, care, and watching, together with a couple of pecks of fresh soil and a small tin of one of the advertised manures, these same plants may be rejuvenated, and a few weeks hence be as productive as they were before the "close time" set in.

First remove every old, yellow, or scorched leaf, also any of the smaller ones infected with fly, spider, or thrip. Having done this, trace all the old, worn-out shoots to their base, and cut them clean away, reserving only the new growths, and these to be as near the stem as possible. Now spread the peck of fresh soil thinly over the surface, and scatter a little manure on top of it. Peg the shoots down to this, and give the bed a thorough watering through a fine-rosed can, using warm water.

Keep the atmosphere of the frame constantly charged with moisture, by syringing overhead three or four times a day. Do not give any ventilation, but shade from strong sunshine, using old fish netting or other light material.

When new growth has well begun, give a little more soil, also a little more fertiliser, pressing it very firmly upon the bed.

Pinching-out the Shoots.

Growth will now be very rapid, and a large number of the new shoots will be showing two or more small fruits. Inexperienced growers are tempted to allow all these to remain, but it will be found sound policy to remove the two last, and pinch out the point of the shoot at the leaf beyond the fruit allowed to remain. This will not only cause the fruit to swell more rapidly, but will ensure other breaks, or laterals, from the same shoot, which in turn will produce and perfect a fruit each.

Give an abundance of liquid manure (twice each week being none too much), and instead of allowing a well-grown fruit of good size to remain on the Vine to become yellow and worthless, cut all as soon as ready. If not wanted for immediate use, stand the necks in jars containing a little water, and store in a cool place. Here they will keep in good condition for a week or more.

F. R. CASTLE.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.*

Illustrations.—*The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, SEPTEMBER 14—Newton Mearns Fl. Sh.

MONDAY, SEPTEMBER 16—
Nat. Chrys. Soc. Floral Com. meet.

TUESDAY, SEPTEMBER 17—
Roy. Hort. Soc. Coms. meet.
Brit. Gard. Assoc. Ex. Council meet.

SATURDAY, SEPTEMBER 21—German Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—56·8°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, September* 11 (6 P.M.): Max. 73°; Min. 47°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, September* 12 (10 A.M.): Bar., 30·1; Temp., 63°; *Weather*—Overcast.

PROVINCES.—*Wednesday, September* 11 (6 P.M.): Max. 67°, Dover; Min. 57°, Scotland E.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Sale of Dutch Bulbs, &c., at Stevens' Rooms, King Street, Covent Garden, W.C.

MONDAY TO FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

Victoria Medalists. We have received information from the Secretary of the Royal Horticultural Society that, at the last meeting of the Council, three new names were added to the list of Victoria Medalists of Honour. The vacancies were caused by the deaths of Sir Thomas Hanbury, Bart., Sir Michael Foster, and Mr. Harry Turner, and their places have now been filled by the election of Sir John T. D. Llewelyn, Bart., Mr. George Dickson, and Mr. Henry Ballantine.

SIR JOHN T. D. LLEWELYN, BART., is a well-known personality in the horticultural world. In 1891 he was elected a member of the Royal Horticultural Society's Council, but retired in the following year. Upon re-election in 1893 he continued to serve in the position until 1902, when he again retired from the Council, and was elected a Vice-President. He is a member of the Scientific Committee, and in many other directions has assisted in helping forward the Society's interests, and the interests of horticulture generally. As President of the Horticultural Club, Sir John Llewelyn has consistently shown such enthusiasm and geniality that have endeared him to all who have been in the least associated with the Club's doings, and his devotion to the duties of his office have repeatedly necessitated special journeys to London from his residence in South Wales in order to attend important meetings. The Horticultural Club has been encouraged to take its part in developing horticultural interests, and as recently as last year it was mainly due to Sir John Llewelyn that the Club was in a position to entertain the foreign visitors and others on the occasion of the holding of the Conference on hybridisation or genetics. The success of that gathering is one of the incidents in the history of the Club that will be recalled with pleasure by all those who are interested in its welfare. Sir John Llewelyn, however, has filled so many positions, and helped in so many movements, that we can only recall some of them. He has been President of the National Potato Society since its establishment, and as Vice-President of the National Chrysanthemum and National Carnation and Picotee Societies, and patron of the National Dahlia Society, Sir John Llewelyn has been brought into many circles of horticultural work, in all of which he has greatly assisted the efforts of those with whom he has been associated.

In another direction Sir John Llewelyn's devotion to horticulture may be seen in the gardens at Penllergaer near Swansea, where practical gardening of the best type has been carried out for many years past. The specialities at Penllergaer include hardy Rhododendrons and Azaleas, Bamboos, and the flowering trees and shrubs. Whilst evincing great interest in the magnificent Rhododendron hybrids that have been raised in recent years, Sir John Llewelyn has nevertheless maintained undiminished his appreciation for the true hybrids. The favourable climate at Penllergaer has enabled many of the Himalayan species to develop into such magnificent specimens as are seldom seen in this country, and their beauty, even when not in flowers, can scarcely be estimated by those who have not seen the plants. In a paper on the Himalayan species, read at a meeting of the Horticultural Club in June, 1904 (see report in *Gardeners' Chronicle*, June 18, 1904, p. 399), Sir John Llewelyn related some of his experiences in their cultivation, and, in addition, showed himself to be a keen critic of the points the hybrid Rhododendrons should possess when judged as florists' flowers.

SIR JOHN T. D. LLEWELYN, BART., V.M.H.

MR. HENRY BALLANTINE has been for many years head gardener to Baron Sir H. Schröder, The Dell, Egham. The Dell gardens are among the most beautiful and best maintained establishments in this country. They are especially famous for the rich collection of Orchids they contain. Many important species and varieties have been shown from this collection at the Royal Horticultural Society's meetings, and may be found in the list of plants which have received first-class certificates. It is interesting to recall some of the fine plants which Mr. Ballantine has first presented from The Dell gardens. Taking, for example, the spotted forms of Odontoglossom crispum, which are among the greatest favourites at the present day, there is a very fine collection at The Dell, and this collection contains specimens from the earlier introductions, which are still some

of the best plants to be seen, notwithstanding they have been under cultivation for long periods. First-class certificates have been obtained by O. crispum Ballantinei, O. c. flaveolum, O. c. Dellense, and O. c. Veitchianum in 1884; O. c. Schroderianum and O. c. Sanderianum in 1885; for O. c. apiatum, which was the sensational Orchid of its day, in 1886, and for O. c. Baroness Schroder, O. c. nobilior, and other grand forms at more recent dates.

Turning to the blotched forms of O. Pescatorei, the record is equally remarkable, The Dell collection still retaining in splendid health the beautiful O. Pescatorei Veitchii (F.C.C., 1882) and O. P. Schröderianum, both of which plants are still unmatched, despite the thousands of specimens of this species which have been imported since that year. Mr. Ballantine had the good fortune to present the first Odontoglossum Wilckeanum on March 10, 1885, and its variety Godefroyæ on the same day. First-class certificates were awarded for both plants. In most of the other sections of Odontoglossum early honours were secured by representatives from this collection. From 1891, when The Dell specimen of Cypripedium insigne Sanderæ secured a first-class certificate, it was for some years, and probably still is, one of the best plants of its kind; and many other cases might be cited where Baron Schröder's liberality in securing the best varieties and Mr. Ballantine's skill in cultivating them to the highest standard have brought credit to the gardens in which they both take such delight.

Although the Orchids have played the most important part in spreading the fame of The Dell gardens, other branches of gardening have been equally well carried out. It would be well for horticulture if the types of owner represented by Baron Schröder and of gardeners by Mr. H. Ballantine were the general rule.

MR. GEORGE DICKSON is the head of the firm of Messrs. Alex. Dickson & Sons, Newtownards, Ireland, and his election to the list of Victoria Medalists very appropriately fills the vacancy caused by the death of Mr. Harry Turner. Messrs. Alex. Dickson & Sons have secured an enviable reputation for raising new seedling Roses, and most of the varieties they have introduced to commerce are now in general cultivation. As showing how much the Newtownards seedlings are appreciated by Rosarians, we may mention that in the National Rose Society's *Official Catalogue of Exhibition and Garden Roses* for 1903, out of the 33 exhibition varieties included in it which were ten or fewer years old, as many as 18, or more than half that number, were raised at Newtownards. Some of the best-known Roses raised at Newtownards include the varieties Dean Hole, Hugh Watson, Irish Harmony (single), Rev. David R. Williamson, Ards Rover, Helen Keller, Hugh Dickson, Margaret Dickson, Mrs. R. G. Sharman Crawford, Ulster, Ards Pillar, Alice Grahame, Bessie Brown, Countess of Caledon, Killarney, Liberty, Mrs. W. J. Grant, Mildred Grant, Lady Mary Fitzwilliam, Florence Pemberton, Ethel Brownlow, Mrs. Ed. Mawley, J. B. Clark, Muriel Grahame Irish Beauty (single), Irish Glory (single), Bettie, Countess Annesley, Countess of Derby, Dorothy Page Roberts, and Lady Rossmore. At the Royal Horticultural Society's exhibition at Holland House in July last no fewer than four new Roses shown by Messrs. Dickson were granted Awards of Merit. The Gold Medal of the National Rose Society was awarded Messrs. Dickson's new Hybrid Tea Rose Lady Helen Vincent at its Metropolitan exhibition this year.

Victor Lemoine. Gardeners are so much indebted to M. Victor Lemoine, of the Nancy Nurseries, France, for the numerous plants he has raised and introduced into commerce, that we are pleased to see in a recent issue of *Möller's Deutsche Gärtner-Zeitung* an appreciative notice of his work as a hybridiser. The notice is so full and exhaustive that it fills the entire issue of that journal. M. Victor Lemoine, of whom we published a portrait in our issue for July 15, 1899, has been engaged in the cross-breeding of plants since 1852, and

HENRY BALLANTINE, V.M.H

his efforts have been attended with unusual success.

He was born on October 21, 1823, at Delme, in Lorraine, his father being a gardener. He studied at the College of Vic-sur-Seille, and after travelling for several years he took service with various nurserymen in Germany, Belgium, and France, finally starting in business for himself at Nancy in 1850. In 1885 he became Knight of the Legion of Honour and Officer in 1894. He was honorary vice-president of the Central Horticultural Society of Nancy, and honorary member of the National Horticultural Society of France, and of several other societies in various countries.

The first of his improved plants was a double-flowered Portulaca (1852), the first of its race. Then came four or five hybrid Streptocarpus, obtained by crossing S. biflorus with S. polyanthus. At that time the new species which have been so greatly improved by Mr. W. Watson, Kew, Messrs. Jas. Veitch & Sons, Chelsea, and others were unknown. In 1862, M. Lemoine introduced Spiræa callosa alba, and some hybrids that he obtained from Monochætum, among others M. Lemoinianum and M. sericeum multiflorum; also Clematis lanuginosa candida, a cross between C. lanuginosa and C. patens. In subsequent years his finer crosses and hybrids included many double Pyrethrums, which are common plants in gardens to-day, Spiræa syringæflora, and S. intermedia. In 1866 came the first true double-flowered Zonal Pelargonium, "Gloire de Nancy," the forerunner of the double varieties now grown. In 1869 he raised Abutilon vexillarium variegatum; he also raised several hybrids between Begonia Pearcei and B. subpeltata In 1871 Lemoine introduced the double-flowered Clematis Lucie Lemoine into commerce. In 1872 he surprised the gardening world with the first double-flowered tuberous Begonia, B. Lemoinei, from which in subsequent years B. Gloire de Nancy and a number of double varieties were obtained. The year 1878 saw the double-flowered Zonal Pelargonium F. V. Raspail and the large-flowered varieties Mme. Thibaut and Lucie Lemoine. In the same year M. Lemoine showed three novelties at Paris which enjoy great favour at the present time, viz., Syringa Lemoinei, the first double-flowered Lilac, Gladiolus Lemoinei and G. Marie Lemoine, the progenitors of the large spotted varieties. The year 1879 saw the hybrids Philadelphus multiflorus plenus, Weigela Emile Gallé, Ceanothus aerostat, and C. Phare. In 1882 Fuchsia Boliviana rosea, Pelargonium peltatum Jean d'Arc, P. p. La Rosiere, and Liliac Mathieu de Dombasle were raised. The following year Philadelphus rosæflorus plenus, Fuchsia Boliviana nivea, Clematis viticella venosa violacea, C. v. Kermesina, and Gladiolus Masque de Fer were raised. Between 1882 and 1900, M. Lemoine distributed many new hybrids and cross-bred varieties of Clematis, Syringa (Lilac), Montbretia, Philadelphus, Gladiolus Nanceanus, Deutzia, Spiræa, Zonal Pelargonium (Paul Crampel and others), Phlox, Begonia Gloire de Lorraine (1893, a cross between B. Dregei and B. socotrana), Astilbe, Diplacus, Gazania, Crassula hybrida rosea (C. jasminea × Rochea falcata), Anemone japonica, Pæonia, Hydrangea, &c.

Among M. Lemoine's later novelties, perhaps the hybrid Deutzias, Montbretias, Gladiolus and Syringas are the most generally cultivated in English gardens.

Apart from his beautiful hybrids and crosses, M. Lemoine has introduced a large number of rare and new species of plants to European gardens, but the mere list of these introductions is more than we can print in these columns.

OUR SUPPLEMENTARY ILLUSTRATION.—Senecios form one of the largest genera amongst flowering plants, and the enumeration of the species and their synonyms occupies more than 13 pages in the *Index Kewensis*. Generally the plants are herbaceous, though not always, and the species exhibit such marked differences as seldom occur in a single genus. In the house devoted to succulent plants at Kew may be found Senecios which might be mistaken for cactaceous plants. Their construction, however, is of quite a different type to the common garden weed Senecio vulgaris—the Groundsel—which attains a height of a few inches only, and to Senecio Wilsonianus, which is one of the giants of the race, for the

the envelope is so hard that it would not be readily dissolved or softened, it can be split into two parts, and here, again, the digestive process would help. The roots from which medicinal preparations are made may not owe their properties directly to birds, but indirectly they do to a large extent. For it is their

Mr. Henry Ballantine, V.M.H.

function to collect the materials required by the leaves for the elaboration of the sap, out of which the various parts of the plant, including the fruit, are formed, and they must, therefore, have their share of the same properties. This may often be detected by the nose alone, the roots and flowers of many plants having the same smell, though, perhaps, not in the same degree, notably in the case of Violets. No doubt, however, roots have acquired medicinal properties of their own. They are generally more or less astringent, as a defence against the insects which would otherwise destroy them.

The Shrubby Spiræas.

December 6th.—Among the Spiræas, while some of the herbaceous perennials are grown by the hundred thousand, the shrubby section is, for some reason or other, comparatively neglected. Yet it contains many handsome species. S. ariæfolia, or, more correctly, S. discolor ariæfolia, shown in the illustration, is one of the tallest, from six to ten feet in height, but not one of the most ornamental, for the white of the flowers is rather dingy. A native of North America, it is perfectly hardy in this country. Both S. Lindleyana and S. Douglasii are much superior to it for garden purposes. The latter bears rose-coloured flowers in August, and the former white flowers in September, and the lateness of their flowering periods makes them additionally attractive. But perhaps the two finest species in the whole group are S. cantoniensis (especially its double-flowered variety), and S. prunifolia flore pleno, which also has double white flowers. The former is an evergreen, and as it seldom exceeds four feet in height, it is an excellent plant for the edge of the shrubbery.

Cutting-down Perennials.

December 7th.—There is no general agreement as to the time for cutting-down herbaceous perennials. In some gardens they are cut down as soon as they begin to look untidy; in others, after they wither; in others, again, the whim or convenience of the gardener seems to be the chief consideration. There cannot be much doubt, however, that the withering should be more or less complete before the operation is performed. In the leaves and stems of herbaceous perennials, just as in the foliage of trees, certain valuable materials are stored, and the gradual change in colour is a sign that these materials are receding down the stems and into the crowns, where they remain until they can be used again when growth begins in the following spring. If, as sometimes happens, the tops are cut away while they are still quite green, the whole of these materials are lost, and must be elaborated afresh—a great waste of energy. The waste is less, of course, when the change of colour has commenced, but it cannot be entirely eliminated until the change is complete. If possible, therefore, herbaceous perennials should not be cut down before the foliage is withered.

H. C. Davidson.

Famous Gardeners at Home.

No. 272.—MR. HENRY BALLANTINE, V.M.H., AT THE DELL GARDENS, ENGLEFIELD GREEN.

There is only one garden in the United Kingdom of which it can be said that the head gardener shares with the owner the coveted possession of the Victoria Medal of Honour. It is some time ago since this honour was conferred upon Baron Sir H. Schroder, whose gardens at The Dell are famous for their beauty and for the high standard of cultivation maintained; and in September this year Mr. Henry Ballantine was awarded the same distinction. Mr. Ballantine, who is one of the best known and most respected of gardeners in the country, both as an Orchid-grower and for his good work generally in the horticultural world, has among his possessions two gifts which he specially values, one being a pin presented to him by Queen Victoria, and the other a similar memento by the Empress Frederick William of Germany. But he does not at all like to talk about himself, and, on the occasion of my visit to the Dell gardens, towards the end of September, he asked me to say as little as possible about him.

"As to the gardens," he said, "instead of attempting to deal generally with them, I suggest that you should refer to some of the Orchids and plants you see in bloom now, concerning which I shall be glad to give you any information I can."

"So long as the special features of the gardens are mentioned, I think we could not do better than proceed according to your plan," I rejoined.

"Then, first of all, we will look round some of the houses, of which there are about fifty."

The Orchid Houses.

Proceeding to the Orchid houses, we were joined by the Orchid foreman, Mr. Clarke, who has been with Mr. Ballantine as chief assistant for a number of years. The whole of the houses are of the most modern character, equipped with every requisite for the culture of the plants in which Baron Schroder has all his life taken such a keen interest. We started with a cool one, containing a number of Odontoglossums.

"There are very few in flower now," observed Mr. Ballantine. "May and June are the best months to see Odontoglossums in flower, but there are some blooms of O. C. Leopoldianum. Of course, ordinary Odontoglossums are easy to cultivate, but the more valuable ones—several are very costly—require very careful treatment."

"Are Nepenthes difficult to cultivate?" I asked, as we passed into a house devoted to a collection of specimens of the Pitcher plant.

"Fairly so. This collection includes the

The Dell, Englefield Green.

best varieties obtainable, amongst them being Hookerii intermedia, Rafflesiana, and Mastersiana."

"Cattleyas, I see, you have in great force?"

"The two Cattleya houses which we are now entering were formerly one, and were divided as a matter of convenience. I will name some of the hybrids of the aurea species—the richest in cultivation—now in flower. They include crosses with C. luminosa, C. Skinneri, C. Mantinii, C. Hardyana, and C. Queen Empress."

"Was Queen-Empress named after Queen Victoria?"

"Yes, and it was raised about eight years ago. Here is another hybrid—C. Mendelli—raised at Marseilles, about 1890. You might note, also, two specimens of the Swan Orchid, very strongly scented, with separate male and female flowers. There are a number of hybrids on the roof."

"How many plants are there in these two divisions?"

"Between fourteen and fifteen hundred. They are all Cattleyas and Lælias. One of the latter now in flower is L. tenebrosa, the Walton Grange variety. The petals are different in colour from other varieties. The small house adjoining is also full of Cattleyas and Lælias, all seedlings, and unflowered."

"Do you devote an entire house to Cœlogyne cristata?"

A Notable Seedling.

"Practically; but it contains a notable seedling, Dendrobium Hillii, a very old variety, not crossed, which ripened in Australia, and was sent here. There is a Lycaste Balliæ in flower in this house. The Cœlogyne cristata alba is very floriferous. I have had plants bearing five hundred blooms. The principal feature in the next house is the Miltonias."

"Which are the more notable varieties?"

"Vexillariums are numerous. There is one plant of Leopoldianum which has had every flower double. We have just one plant of Vexillarium In Memoriam G. D. Owen, which was obtained from the late Sir Francis Wigan's collection. Here are two Lælias worth mentioning, one a hybrid, Baroness Schroder, which we raised twenty years ago, and the other Lælia præstans alba, an exceedingly good and rare variety."

"Now," continued Mr. Ballantine, "we come to an intermediate house, containing Cypripediums and Masdevallias, including a plant of chimæra, with very remarkable flowers, all dissimilar."

Valuable Odontoglossums.

"And more Odontoglossums?"

"Yes, and one of these is Odontoglossum Princess Christian. It is an imported plant, which we obtained twenty years ago, and I have had it with branches of thirty-five blooms. The flower is singularly clean-looking. O. C. Regal is noticeable for the excellent shape of its flowers. But here is the most valuable Orchid in cultivation."

"What is the name?"

"O. Pescatorei Veitchii. It is now nearly twenty-six years since we bought it, and there is probably not another of the same age in this country. They usually die out much sooner. This is the most beautiful specimen of its kind, white ground, with deep purple blotches, and it has large, branching spikes. Another old piece of a special variety is O. Crispum Veitchianum, bought many years ago."

"The plants in this house must be worth a very large sum of money?"

"One little corner of it represents several thousand pounds. The plant of O. Pescatorei Veitchii, for which we paid £50, is now worth quite £2,000. Then there are several very rare Crispums. We gave 1,150 guineas for Pittiana, at Mr. Pitt's sale. There is a specimen of O. C. Brittanica worth five or six hundred guineas; O. C. Sanderianum, O. C. Rex (large, blotched forms), O. C. Fearneberg, and O. C. Graviana are other rare varieties."

Certificated Varieties.

"Are there many in this house for which you have been awarded certificates?"

"Here is one of the unique Ballantinei, remarkable as a blotched form, and the collection includes plants of O. C. flaveolum, O. C. dellense, O. C. Veitchianum, O. C. Schroderianum, O. C. apiatum, O. C. Baroness Schroder, and O. C. nobilior, for which we received certificates. Then there is the original Odontoglossum Excellency, a natural hybrid from triumphans and Pescatorei, which has been here for two and twenty years. Next only in merit to O. Pescatorei Veitchii is O. P. Schroderianum. And now, I think, if you add Oncidium Violasin album, a very pretty white, and O. Crispum Linderii and O. C. Lucantum, you have the names of the cream of the rare Orchids in this house. If you also note Lælia anceps Williamsiana and its varieties, especially Arides, which we have had for twenty-two years, we might finish the Orchids with the Cypripediums."

"Have you many of your own seedlings in the Cypripedium house?"

"Several, and some which have not been flowered yet. C. Olivia is a pretty hybrid, and so is C. Maude. The most rare of the Cypripediums is Stonei platytœnium. Sir Trevor Lawrence is the only other collector who possesses this. The flower originated with an importation of Stonei by Mr. Day, of Tottenham. Another hybrid, marked the same as Maude, is Callosum Sanderæ. The Cypripediums in flower include James H. Veitch, and longifolium. We bought the last forty years ago at Wandsworth, and started hybridising with it. Speaking of hybrids, you might mention Dendrobium Illustrée, one of Veitch's hybrids, the first break from the ordinary Dendrobium."

"What about Calanthes?"

"Oh, we have still to see that house, which includes the finest Calanthe in cultivation, Baron Schroder, raised fifteen years ago. A fine early Calanthe is Harrisii, and the darkest is C. Baron Schroderi superba.

The Cultivation of Anthuriums.

"You have some fine specimens of Ferns."

"There is one particularly of Davallia fijiensis, one of the original plants sent from Fiji to this country; it is eight feet through on the stage. Another original plant in this house is Anthurium Andreanum, and other varieties include the white variety, Lawrenceanum, and Madame Pynaert, white, with a pink spadix. We have a batch of seedlings between the white and the scarlet, and they come in all colours. Moisture is absolutely indispensable in the treatment, and heat also. We have to cut these Anthuriums down every year, as there is almost any number of plants at the bottom."

"What are the features of your stove?"

"Perhaps the most wonderful specimen is the Vanilla plant, which keeps rooting round as it grows. The specimen of Gloriosa superba, which is a fine decorative plant for the table, has been here thirty-five years, and keeps on flowering for three months. There are two fine specimens of Dracæna Victoria in pots. After they have flowered, we cut them down."

"I see that you go in for Nerines?"

"We bought the first bulb forty years ago. Last year we had from seven to eight hundred spikes; some had fifty bulbs in a pot. Nerines should be kept dry for three months, and ripened off about the beginning of June; they last in flower for a fortnight, and glitter in the sun. It is important to remember that Nerines rarely flower after the leaves begin to grow. They are, as you know, of South African origin, and this variety is Fothergilli major."

"With respect to other houses," continued Mr. Ballantine, "you might say that, in the greenhouse, Rochea falcata, one of the Cactus tribe, has big trusses of flower. I mention it because Rochea will grow well in a cottage window, and will keep alive for a month, even if people forget to water it."

Fruit Under Glass.

"Now we might take the fruit houses."

"In the Vineries we grow Muscat of Alexandria, Madresfield Court, Alicante, Lady Downe's Seedling, Appley Towers, and Lady Hastings. We have both outside and inside borders. Peaches, Figs, and Plums are grown

The Gardener's Cottage at the Dell, Englefield Green.

in cases, the Peach case being a hundred and fifty feet long, and the Fig and Plum case a hundred feet. The cases run the whole length of the kitchen garden. The varieties include all the best known, and we have had some particularly fine fruit of Sea Eagle and Princess of Wales Peaches. The kitchen garden itself is about two acres in extent, and is devoted entirely to fruit and superior vegetables. No flowers are grown in it, and Potatoes, Cabbages, and French Beans are grown in two or three acres outside, which are appropriated to that purpose. There have been some fine crops of Plums, Morella Cherries, and Pears, on the wall, and one Pear tree (Souvenir du Congres) has yielded an enormous quantity of fruit."

"Your flowers outside the houses include, I observe, a number of very healthy-looking Fuchsias."

"They not only look, but are healthy. They all stand under the early Peach-house through the winter, with a little straw for protection. The varieties are Rose of Castile Improved, Swanley Gem, and Phenomenal."

"Do you grow many Chrysanthemums?"

"Nearly two thousand bush plants. We have as many as sixteen hundred in the large house. Winter-flowering Begonias are also largely grown. One of the best is Ensign, and the other good varieties are Winter Cheer, Julius, Mrs. Heal, and Winter Perfection. We also grow Begonias, Gloire de Lorraine, Turnford Hall, Gloire de Sceaux, and other sections."

The Pleasure Gardens.

From the house and kitchen garden we proceeded under the subway in the main road to the flower garden and lawns surrounding the mansion. All this was done under the auspices of Mr. Ballantine, during the forty-three years he has been in charge of The Dell, and it would not be easy to exaggerate the beauty of the place. Mr. Ballantine, it is true, said that I ought to see it in the spring, when the Rhododendrons are in flower, and I can quite imagine that then it looks its brightest and best. But at all periods it has many charms. The foliage of the Rhododendrons themselves constitutes one attraction, and, commenting on their growth, I asked Mr. Ballantine to tell me the names of some of the varieties.

"There are all the best hybrids, and, while many of the beds are mixed, there are also numerous beds containing one variety. The latter include The Queen, Pink Pearl, Whitworth, Kate Waterer, Baron Schroder, and Baroness Schroder. The growth of the Rhododendrons is so remarkable that we have to move some of the inferior plants to give space for the better."

"Then, on the lawns, your Yews and Cedars are a great feature."

"The grand old Cedar which is chained up is more than a hundred years old. It has grown considerably since the time it was moved in 1878. One of the Cedars came up in my time, and another, now a tremendous tree, was planted in 1865. In addition to the Yews (Golden and Irish), there are several specimens of Weeping Hollies and Weeping Wellingtonias. In the drive to the front door are masses of golden Yews, golden Hollies, and Retinosporas, all of which were replanted by me."

Bedding on the Terrace.

At this part, Mr. Ballantine conducted me to the north balcony, which looks straight across the Windsor Great Park, a prospect which could not fail to afford satisfaction to the most fastidious critics of natural scenery. This is really the dell, from which the place takes its name, and from the rising ground there is a splendid view of Windsor Castle on the right, Eton College on the left, and the Bucks Hills beyond. Returning to the lawn, I enquired how the bedding on the south front was made up, and Mr. Ballantine replied:—

"The scheme embraces thirty beds, and the plants consist of Begonias, Ivy-leaf Geraniums, Heliotropes, Coleus, Lobelias, and Iresine. In the vases on the terrace are American Aloes, and Geraniums—Her Majesty, Mrs. Pollock, and Shrubland Pet."

"Have you any difficulty in regard to soil?"

"The land is all poor, and we have to use large quantities of manure and peat, to produce anything approaching good results. The only other feature is the rockery, in which, as you see, there are not many plants in flower just now. But there are a few, including Japanese Anemones, Veronicas, Phloxes, Saxifrages, Cyclamen, and Camellias. Now, I think you have a very fair idea of The Dell gardens, though I doubt whether you can have any notion of what the pleasure grounds looked like at the time I commenced the conversion of a field into what now forms the greater part of the lawn."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 279.—WEEDS, INSECTS, AND CANNAS.

DEAR KATE,—"Weeds! What an unpleasant subject this week," I hear you say. Yet it is one which we all have to consider, if we care for our gardens, for nothing is more disastrous than a crop of weeds, which quickly exhaust the soil and choke less hardy things out of existence. If only our flowers and vegetables would grow so easily, how little trouble we should have! But it is of no use wishing that.

Amongst the worst weeds are those which have seeds which are winged, or have a little parachute to fly about with, such as Dandelions, Groundsel, Hawkweeds, etc. They all have a plan of rushing up, flowering, and ripening seed before you can look round, and woe be to your garden if you don't destroy them before they can do this, for every one of them will propagate his kind, with the help of the wind, by the hundred if not the thousand, and you will have your work cut out for the season to get even with them. Even in the best-regulated garden, however, some weeds will appear, although it is possible to bring down their numbers to a few only, which are then more easily dealt with.

Fortunately, the birds (even the much-abused sparrows) do their best in winter to help us, by eating the seeds of many weeds, Groundsel, Chickweed, Shepherd's Purse, Plantain, etc., being favourite food, on which they live, to some extent, when other fare is scarce. If it were not for this help, we should probably be overwhelmed with weeds, and gardening would become a hopeless task; but, as it is, we have quite enough to do to keep the weeds down.

Work for the Winter.

During the winter, however, we may make a start by clearing away every visible weed, and either burying the whole of them, or (if they have been allowed to come to seed) burning them. All the empty spaces in the kitchen garden can now be rough-dug with much advantage, for in this way it becomes possible for the coming snow and frost to penetrate it deeply, carrying their fertilising and cleansing properties with them, and the birds are enabled to pick out from amongst the clods many grubs and insects which would otherwise be safe from their sharp eyes and long beaks. Blackbirds will spend the winter hunting for slugs, thrushes for snails, and robins for all kinds of smaller insects; but they cannot do their work well in a weedy garden. Just watch them for a few minutes at work on newly-turned soil, or even on a bed which has been loosened with a Dutch hoe, and you will soon see how they enjoy such a dinner table, and what a feast you have provided for them.

The Dutch hoe is one of the garden tools which should be always in use, both to destroy all weeds whilst they are too young to stand being upset by it, and to keep the surface open for the rain, the sunshine, and the dew in summer, to penetrate the soil; and I think it

SOME OF THE SUMMER BEDDING AT THE DELL, ENGLEFIELD GREEN.

VOL. LI.—No. 2,831. SATURDAY, FEBRUARY 1, 1908.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Nickerson Prizes for Roses.

It will be remembered by those who take an active interest in roses that last year Mr. W. E. Nickerson, an enthusiastic rosarian resident at Boston, U.S.A., presented three silver cups to the National Rose Society, to be awarded to the raisers of the best hybrid perpetual, the best hybrid tea, and the best tea-scented variety introduced within a prescribed period. The award of these cups was entrusted to a specially appointed committee, and in the result the raisers of Frau Karl Druschki, Madame Jules Gravereaux, and Dean Hole, were adjudged the winners. As these roses are of German, French, and Irish origin no one could well suggest that in the making of their awards the members of the committee were influenced by insular prejudice. Their selection has been questioned by some, but this has been largely due to the fact that the time limit has been overlooked. Mr. Nickerson was so well satisfied with the results that this year he has placed twelve cups at the disposal of the society for honouring the best dwarf and climbing roses, without any stipulation as to the year of introduction. He suggests that four cups should be awarded for bush roses, four for climbers blooming in trusses, and four for climbers with flowers not in trusses, the cups in each group to be awarded to the best red, the best pink, the best white, and the best yellow variety. All colours are to be admissible and to be arranged under the head to which they approach most nearly. For example, all reddish shades deeper than deep pink are to be classed as red; salmony, etc., shades to be classed as pink; canary, buff, orange, etc., shades to be classed as yellow, and all very light tints or shadings to go with the whites. These suggestions are of much value, and will, we have no doubt, be acted upon, but it is not difficult to foresee that the preparation of a scheme for giving practical effect to Mr. Nickerson's views will require much care and thought; and this we know will be ungrudgingly given by the executive of the National Rose Society. The climbers flowering in trusses are such varieties as Crimson Rambler, Dorothy Perkins, and Lady Gay; and the climbers producing their flowers singly or at most a few in a cluster are best represented by Aimée Vibert, Gloire de Dijon, and Madame Berard. Believing that the only method by which anyone can obtain a really complete and accurate idea of the value of a variety, Mr. Nickerson recommends that the lists sent to those taking part in the election should contain a scheme of marking by points. For example, one hundred points would constitute a perfect variety, one in which the flower is faultless in form, colour, opening, keeping qualities, fragrance, etc.; the foliage, growth, hardiness, resistance to blight and pests of the highest order, while the plant should bloom continuously. It is suggested that each of the following qualities should be covered by five points each, and in putting this into practice on Frau Karl Druschki, Mr. Nickerson obtained the following result: The flower—Form, 3; size, 4; substance, 4; colour, 5; permanence of colour, 5; distinctiveness, 4; flower stem, 4; fragrance, 0; opening, 4; keeping, 3; total, 36. The bush—manner of growth, 3; vigour of growth, 4; constitution and healthiness, 4; adaptability to situation, 4; colour and brightness of foliage, 3; form and arrangement of foliage, 3; hardiness to cold, 4; resistence to mildew, 3; freedom of bloom, 3; continuity of bloom, 3; total, 34; or a grand total of 70. It is believed that if some such plan as is here briefly explained could be adopted and clearly set forth in the circular letter accompanying the voting list, much useful information would be brought out about the qualities of the roses voted upon as they appear from different points of view, and in different localities. On the other hand, it is feared that without a point marking scheme many taking part in the election will vote without the proper amount of detailed and definite thought, giving mere impressions which they may have, and in any case it would not be known on what grounds their opinions were based. Recognising the fact that under the scheme only twelve roses will be honoured out of the scores entitled to distinction, Mr. Nickerson very generously offers to place a sum of money at the disposal of the National Rose Society for the purpose of having a suitable diploma prepared, so that the second and third most popular roses in each section may receive proper recognition. In addition he suggests that all roses receiving a certain percentage of the votes be named in the published account of the contest, it being thought that in this way probably the most popular hundred roses or thereabouts will become known to the rose world as such. Mr. Nickerson's suggestions for ascertaining which are the most popular roses are so new in character and comprehensive in scope that the election can hardly fail to prove of immense interest to rosarians, and the results of much value to all who grow roses. The preparation of the scheme, and the carrying out of the details will be not the least important of the work included in

MR. H. BALLANTINE, V.M.H.

the programme of the National Rose Society for the current year, and the display of the winning varieties will, unless we are much mistaken, be not the least attractive of the many features of its metropolitan exhibition in July next.

Mr. H. Ballantine, V.M.H., whose portrait we have the pleasure of giving herewith, is one of the best known of gardeners, and is held in high esteem both for his great cultural skill and geniality of disposition. Exactly how many years Mr. Ballantine has had charge of the gardens of The Dell, the charming residence of Sir Henry Schroder, Bart., at Englefield Green, we are not now able to say. We are, however, able to state that he has occupied his position for a very long time, and that throughout the period the gardens have been regarded, and properly so, one of the most noteworthy horticultural establishments in the country. The Dell gardens have become the most famous for their collection of orchids, and having regard to the extent of the collection, the great value of large numbers of the varietal forms, and the splendid development of many of the specimens, this is in no way surprising. The collection of orchids is unique, but the gardens contain many features, each one of which is sufficient to make them famous. The collection of choice rhododendrons is extensive, and the condition of the plants such as to evince cultural skill of the highest class, while the rock garden with its many beautiful alpines presents many charms to lovers of hardy flowers. Mr. Ballantine possesses in an eminent degree the skill and judgment essential to an orchidist of the highest class, but he is equally at home in all other departments of the garden, as proved to demonstration by the splendid results that are annually obtained. Last year Mr. Ballantine had the well-deserved honour of receiving from the Council of the Royal Horticultural Society the Victoria Medal of Honour in Horticulture.

Gardens Around Horsham.—We would remind our readers that in the issues of the Gardeners' Magazine for the 8th and 15th inst. we shall describe and illustrate some of the most notable gardens in the district of which the town of Horsham is the centre. This is one of the most important gardening centres in Sussex, both as regards the number of important gardens and the great interest that is associated with them. Both issues will be profusely illustrated with finely executed reproductions of photographs specially taken for the purpose.

New Flowers at Vincent Square.—We learn with very great pleasure that on and after February 11, all plants and flowers to which a first-class certificate or award of merit are granted by the Floral Committee of the Royal Horticultural Society must be staged on a table in front of one of the annexes in the hall, instead of being returned to a group that the exhibitor may have arranged. As a rule, after the committee rises, the certificated plants become distributed through the exhibition and are therefore most difficult to find. We have on previous occasions urged that all new plants and flowers receiving official recognition should be set up in a special position together, because of the greater convenience such an arrangement offers to the general public, and because such a proceeding is in accordance with the original intention of the fortnightly meetings. We hope the other committees will follow the example of the Floral Committee in this matter.

The Chester Paxton Society's programme for the second half of the winter session commenced on January 18 with a lecture by Mr. J. W. Siddall on "Springtime in the Undercliff District of the Isle of Wight." The other lectures are on February 1, "The Common House Fly," by Mr. R. Newstead, A.L.S.; February 15, "The Flora of India and Ceylon," by Mr. Joseph Thompson; and February 29, "Herbaceous and Alpine Plants," by Mr. W. S. Sharp.

Brassica Hybrids.—At the meeting of the Scientific Committee of the Royal Horticultural Society on Tuesday an important paper was read by Mr. Arthur Sutton, V.M.H., on Brassica hybrids. The meeting was on this occasion held in the lecture room, which was well filled. The comprehensive experiments on which Mr. Sutton's paper was based were commenced in 1905, and were conducted with a view to determine the extent to which the several kinds will intercross. In the course of the experiments it was proved to demonstration that the brassicas which had originated from the wild cabbage readily intercrossed with each other, but would not enter into union with the rapes, turnips, or kohl rabi. As the result of the intercrossing of the descendants of the wild cabbage, two distinct forms of much value for culinary purposes was obtained. One of these was derived from a cross between the Brussels sprout and the savoy, and the other originated from a cross between the Brussels sprout and an ordinary cabbage. Numerous hybrids were obtained between the rape and the thousand-headed kale, but these were for the most part sterile. Hybrids were also obtained between the thousand-headed kale and kohl rabi, and between the kale known as Ragged Jack and the swedes. The first year the progeny was of a very mongrel character, as might, Mr. Sutton said, have been expected, but in the following season the plants raised from seed saved from the hybrids resembled, in well-defined proportions, the forms used in making the original crosses. There was a brief but interesting discussion, and in the course thereof Mr. Sutton, in answer to an inquiry, expressed the opinion that it would probably not be possible to bring the hybrids obtained to the same high degree of perfection as the parents within the course of an average lifetime.

Preservation of Ludshott Common.—An appeal is being made by the Ludshott Common Preservation Committee for the funds necessary for the purchase of Ludshott Common, which forms one of the group of commons at Hindhead and the tract of woodland between the common and Waggoner Wells. The 542 acres of common, and the 17½ acres of woodland can be purchased for £1,675, and the legal and other expenses are estimated at £125. Towards the £1,800 thus required £700 has already been subscribed. It is proposed if the purchase is effected to vest the land in the National Trust for places of Natural Beauty. Mrs. Lyndon, of Grayshott, is the honorary secretary of the committee.

R.H.S. Guild.—The movement on foot for the promotion of a guild of old Chiswick students and officers, and old and present Wisley employees of the Royal Horticultural Society is receiving the attention it merits. To put the whole matter on a definite basis and to decide the title, rules, etc., a meeting of those eligible to join the guild will be held in No. 3 Committee Room, at the Royal Horticultural Hall, Vincent Square, Westminster, on Tuesday, February 11, at the conclusion of the R.H.S. annual meeting. It is hoped that all old Chiswick and Wisley men will do their best to attend.

Field Botany Excursion.—An interesting experiment in field botany has been conducted for three successive seasons by Prof. F. W. Oliver, F.R.S., of London University College. A large area of salt marsh at Erquy, in Brittany, was selected, and this it was proposed to inspect for many successive years for the purpose of noting the distribution of plants, migration, differences of plants in varying degrees of salinity of soil, alteration of conditions and plants, and other similar and useful questions. Upwards of twenty students have joined each year in this most interesting study, and they have spent a most enjoyable as well as profitable time at Erquy.

Fall of a Giant Poplar.—During the December gales a very noble specimen of Populus deltoides was blown down in Christ Church Meadows, Oxford, a few yards west of the Oxford Botanic Garden. This tree had attracted the attention of many persons interested in aboriculture. When divested of lop and top its trunk measured 55 feet in length; girth, twelve feet from base, 16 feet; it contained 1,056 cubic feet of timber, and weighed 20 tons. Last year G. Claridge Druce, Esq., collected leaves of it for distribution to the members of the Botanical Exchange Club of the British Isles, in order to contrast it with the foliage of another giant black poplar growing close by. The specimen under note had very large clusters of mistletoe, supposed to have been brought by the birds from the Botanic Garden, where there is a large display of this parasite. This form of poplar grows rapidly in the Midlands, and though its wood is soft it is tough. To remove the tree, which fell across the west arm of the river Cherwell, was a task of considerable difficulty, for chains and steel cables attached to it snapped like cotton under the strain of a powerful Burrell compound engine. However, after two days' work the log began to roll, it was drawn ashore, cut in half, and conveyed to Littlemore, three miles distant.

Rose Culture at Bristol.—Under the auspices of the St. Martin's Branch of the Church of England Men's Society, a series of lectures has been arranged for the winter session. The January lecture, given in the schoolroom by Mr. T. P. Elkes, head gardener at St. Agnes' Home, Knowle, Bristol, deserved a larger audience than it received. The subject, "Roses and their Culture," was ably dealt with by the lecturer, who, dealing first with the historical side of the national flower, led his audience by easy stages through the different phases of successful rose culture, illustrating his remarks on pruning by practical demonstrations on varieties he had specially selected and potted for the purpose.

The Horticultural Club Annual Dinner will take place on Tuesday, February 11, at 6 p.m., at the Hotel Windsor, Victoria Street, Westminster. After dinner there will be music under the direction of Mr. F. Morrison. Those desirous of attending this function, to which ladies are especially invited, should notify the Secretary, Mr. E. T. Cook, not later than February 16, as accommodation is limited.

Scottish Horticultural Association.—The Right Hon. Lord Elphinstone has been elected hon. president of this association for 1908; Mr. James Whytock is president; Messrs. D. Kidd, W. H. Massie, and M. Todd, vice-presidents; and Mr. A. D. Richardson, secretary and treasurer. The retiring president, Mr. D. W. Thomson, was presented on January 4 with a finely illuminated address in appreciation of his services to the association, whose membership is now 1,306.

spot within so short a distance of the heart of the Black Country. Kinver Edge has now been presented by the family of the late Mr. Thomas Grosvenor Lee, of Birmingham, to the National Trust, to be held for the use of the public. This munificent gift comprises some two hundred acres of heathery moor, which will be much appreciated, and will serve to keep green the memory of the famous naturalist. At a public celebration of the gift on September 28, Canon Rawnsley, the chairman of the Trust, formally accepted the gift, and Lord Dartmouth and the Mayor of Stourbridge made speeches congratulating the Trust on the acquisition of its first piece of property in the heart of the Midlands.

Four Veteran Gardeners.—We reproduce in fig. 51 an interesting photograph of four veteran gardeners, Messrs. H. Ballantine, T. Robinson, J. Jemmett, and A. Sinclair, taken recently in the garden of Mr. Ballantine at Westwood, Egham, where he now resides. Each of these four gardeners is over eighty years of age, and their combined ages amount to 336 years. Mr. Ballantine was born in 1833, and began his gardening career in Scotland. While still a young man he was appointed gardener and bailiff at "The Dell," Baron Schröder's residence at Englefield Green. Here he stayed for nearly half a century, and the late Baron, who esteemed him very highly, on his death left Ballantine a legacy of one thousand pounds. He was a keen and successful Orchid grower, and was for twenty-five years a member of the R.H.S. Orchid Committee. In 1907 he was presented with the Victoria Medal of Honour, and in 1911 he retired from "The Dell" appointment. Some particulars of his career, and a portrait, were published in *Gard. Chron.*, Sept. 14, 1907, and his retirement is mentioned in the issue for April 1, 1911. Mr. T. Robinson was born in 1835. His experience was chiefly gained in the south of England, but his first post as head gardener was at Maryborough Park, Cork. Later he was for twenty-nine years gardener and bailiff at the Royal Indian Engineering College, Cooper's Hill, and retired in 1899. Mr. J. Jemmett is the eldest of the little group, having been born in 1831. He is still in harness and has never been absent from work for a day through illness, being hale and hearty. For the last fifty-six years he has held the post of gardener at Milton Park, Egham, where he has served three generations of Barons de Worms. Mr. A. Sinclair is two years younger than Mr. Jemmett. He began work at nine years of age, and has had a very varied experience, having served in gardens as far north as Banff. His last position was that of head gardener to R. Charington, Esq., at Hunsdon House, Ware, where he remained for fifteen years, retiring in 1909.

Potato Grower Fined £300.—At Wisbech Police Court recently George Tansley, a Potato grower, was fined £300 on twelve counts of having sold seed Potatos at prices above the maximum. The excess profit was £211. He pleaded that the Government had commandeered 167 tons of his Potatos at £8 a ton, while his neighbours had obtained £11 a ton on the market.

Medlar Seeds as Poultry Food.—It is not generally known (states the *Journal of the Royal Society of Arts*) that the seeds of the Japanese Medlar (Eriobotrya japonica), a tree which is grown for its fruit on the French Riviera, can be used for feeding poultry, rabbits, and other domestic animals. They can also be used for distilling a spirit resembling Kirschwasser. Food for poultry can be prepared by simply boiling the fresh or dried seeds in water for thirty to forty-five minutes, and then crushing them or using them whole, as may be desired; or, instead of being boiled, they may be roasted like coffee. Another plan, which has the advantage of not requiring heat, is to crush the seeds, then moisten them with sufficient water, and allow them to remain in this state for twelve hours. The mass is spread out in a thin layer to dry in the sun, in order to remove any traces of the bitter flavour. This poultry food can be used dry or wet as preferred.

Soil Bacteria.—During the past eight years Mr. H. Joel Conn has been engaged in the very difficult and important work of studying the bacterial flora of the soil.* Our knowledge of the bacterial content of the soil progresses very slowly, and this because of the fact that it is a new branch of science. The organisms have to be isolated and cultivated. Many of them are new and not easy of cultivation under artificial conditions. The soil bacteria are of two types: those which form spores and those which do not. The former are relatively few in number, and are probably not of agricultural importance, since they appear to occur in the soil only in their spore—or resting—stage. The non-sporers, on the other hand, occur in great number and variety, increase amazingly when the soil is manured, and also when it is aërated. Some of them are known to be ammoniafiers—that is, producers of ammonia. As an example of the effect of aëration on the bacterial population of the soil, Mr. Conn mentions that whereas 1 gram (about 15 grains) of dry soil yielded about 16 million colonies, a similar amount of the same soil yielded after aëration about 28 million colonies. It will evidently be a long while before we shall be able to purchase soil fertility bacterial starters, which, added to soil, will infallibly set going those beneficent processes of corruption—and those only—whereby the food and stimulant necessary for perfect vegetable growth are produced. Yet it does not require much vision to see the agriculture and horticulture of the future employing the bacteria of the soil in as sure and beneficent a manner as the dairyman now employs cultures of micro-organisms to act as starters in producing the kind of cheese he wants.

* *Soil Flora Studies.* Bulls. No. 57, 58, and 59, New York Agric. Exp. Station, Geneva, N.Y.

HISTORIC FIRM.

With some notable exceptions British seed firms have been more or less short-lived. They have flourished for periods of varying brevity, but few have continued successful for more than a century. That being the case, it is cheering to find an exception in the case of a firm which is known, not only throughout Scotland, but also throughout the whole of the United Kingdom—that of Messrs. Austin and McAslan, of Glasgow. The bicentenary of the firm was celebrated on the 28th ult. by a dinner in the Trades Hall, Glassford Street, Glasgow, at which a numerous and representative company was present. The chair was occupied by Mr. Alexander N. Hunter, the present head of the firm, and the guests numbered about one hundred and fifty. The Lord Provost and other important townspeople were present, and Sir Robert Wright, the chairman of the Board of Agriculture for Scotland. Representing the staff of Messrs. Austin and McAslan were Messrs. John Cairns, R. M. Young, S. G. Smith and J. J. Robertson. The following represented the garden and agricultural seed trade and nursery trade: W. Cuthbertson (Dobbie and Co., Edinburgh), J. M. Bridgeford (Watkins and Simpson, Ltd., London), A. W. Johnson (Hurst and Son, London), Andrew Aitken (Chas. Sharpe and Co., Ltd., Sleaford), T. S. Findlay (Findlay Bros., Baillieston), Joseph Dobson (Wm. Leighton, Glasgow), T. B. B. Kerr (Kerr and Co., Glasgow), James Gray (Glasgow), W. P. Maltman (Alex. Cross and Sons, Glasgow), James McKenzie (Glasgow), Andrew Motherwell (Glasgow), T. C. Meldrum (Smith and Meldrum, Forfar), John Sutherland (Lenzie), John Smellie (Busby), Thos. Jeffrey (Edinburgh), Chas. Young (Kennishead), Thos. Thomson (John Donaldson and Co., Edinburgh), J. D. Alexander (Pringle and Alexander, Glasgow), R. W. Todd (Dunlop and Todd, Glasgow), Robt. Howie (Glasgow), W. Gilchrist (W. Gilchrist and Sons, Glasgow), P. M. Hamilton (Arch. Hamilton and Sons,

BALLHAM Ann of 11 Bath-street **Stoke-on-Trent** widow died 2 March 1929 Probate **London** 23 April to Francis Ballham labourer and Thomas Harrison draughtsman. Effects £1329 13s. 4d.

Thomas Bannerman

Gardeners' Chronicle 1877, n.s. 8

The subject of our present note was born in 1840, in Golspie Tower, Sutherlandshire, a village near Dunrobin Castle, the seat of the Duke of Sutherland. At the age of 13 he entered Dunrobin Gardens under Mr. McDonald, and was there for some time employed in the flower and kitchen gardens, after which he was moved to the houses to look after the fires, &c. While at Dunrobin he had a good opportunity of acquiring a sound knowledge of outdoor gardening, under the able superintendence of Mr. McDonald, who always took great interest in imparting instruction to his juniors. He remained there until November, 1857, when he was recommended by Mr. McDonald to the late Mr. Fleming of Trentham, which gardens he entered in the beginning of 1858. Here, after working a few weeks in the kitchen garden, he was moved to the Melon and frame ground, where pot Vines, succession Pines, Melons, and Cucumbers, &c., were largely grown. Mr. Fleming considered this one of the best charges for a young man, and Mr. Bannerman was entrusted with it for eighteen months, and was then moved to the late vineries, and soon after took charge of the early ones also. “I took a great interest in this department, and there were some very fine fruit grown under the management of Mr. Henderson, who was head gardener at Trentham at that time."

In 1861 he was recommended by Mr. Fleming and Mr. Henderson to Lord Bagot, and he went to Blithefield on October 14 of that year. Here the vineries were in such a state that it was found useless to attempt to grow Grapes until the borders were renewed, notwithstanding that his employers were anxious to have a supply of good Grapes. The early vinery was necessarily forced, owing to the obligation to force many plants for cut flowers, and a very poor lot of Grapes was the result.

"I cut the last bunch," he writes, "out of the early house on June 8, and at once commenced to make my first Vine border. I had the house well shaded with mats, as the Vines were quite green in leaf. I took them up, made new drainage, and replanted them in a new border, of which 3 feet was inside and 3 feet outside. I kept the house for ten weeks afterwards at about 65º at night, with a moist atmosphere; the Vines soon commenced to make growth, and by the autumn the border was filled with fresh roots, and the following year we had a very fine house of Grapes ripe at the end of May. My employers were so satisfied with the result, that they had three new vineries put up that autumn, and gave me permission to renew all the other houses. The following year I had them all reheated and new borders made, and the result has been so satisfactory that his lordship has since put up two other ranges of forcing-houses."

Of the success he has had in fruit growing Mr. Bannerman remarks that the gardening public will be the better judges. Suffice it to say that during the thirteen years he has been an exhibitor he has taken over 600 prizes for fruit at the London and local shows.

"I have much," he adds, "to be grateful for in respect to the confidence reposed in me and the kindness shown to me by both Lord and Lady Bagot, by whose desire we are always adding to and improving the gardens."

ENGELMANN; who was also 2nd prize winner with Blush, a charming variety; 3rd, Messrs. S. LOW AND Co., with White Pearl. For twenty-five blooms of a white Carnation; Mr. ENGELMANN was placed 1st with Crystal White, in fine form; 2nd, NEWPORT CARNATION NURSERIES, with White Wonder. For a rose-pink variety, Mr. ENGELMANN again led, with Delice; 2nd, NEWPORT CARNATION NURSERIES. The best salmon-pink variety, 25 blooms, was Laddie, finely shown by Mr. ENGELMANN; 2nd, Mr. G. WEST; 3rd, NEWPORT CARNATION NURSERIES. For a crimson variety, similar conditions, E. WORMALD, Esq., led with Carola; 2nd, Mr. ENGLEMANN; 3rd, Mr. A. G. POINTING, Bulpham, Sussex. In the class for a scarlet variety, Mr. ENGELMANN led with Thor; 2nd, Lt.-Col. Sir R. BAKER (gr. Mr. Usher), Ranston Blandford; 3rd, Mr. A. J. POINTING.

Mrs. A. LIPPMAN SYMONS was awarded the first prize for a basket of Carnations, consisting of Carola, associated with Asparagus, Ivy and Berberis foliage; 2nd, Messrs. R. F. FELTON AND SON, Hanover Square, with a bold and handsome arrangement of Mrs. Walter Hemus. Messrs. FELTON secured 1st prize for a bouquet of Carnations.

AMATEURS' CLASSES.

First prize for a group of Carnations in pots, was won by C. A. CAIN, Esq. (gr. Mr. T. Pateman), The Node, Welwyn, with plants carrying numerous blooms; 2nd, Mrs. A. LIPPMAN SYMONS, Marden, Kent.

In other classes for plants in pots Mrs. E. PALMER, Sherfield-on-Lodden, and E. WORMALD, Esq. (gr. Mr. R. Lay), Potters Bar, were the leading prize-winners.

Sir RANDOLF BAKER led in the class for a collection of cut Carnations, with a handsome group in which Saffron, Circe and White Wonder were conspicuous; 2nd Mrs. W. RAPHAEL; 3rd Mrs. E. PALMER.

Competition was quite good in the amateurs' classes where three flowers of a variety were required. Sir R. BAKER led for a white sort with White Wonder; Mrs. A. LIPPMAN SYMONS, for a salmon-pink variety with Salmon Enchantress; Sir R. BAKER for a pink variety with magnificent blooms of Pink Sensation; Mrs. LIPPMAN SYMONS for a crimson, with Carola; Msr. W. RAPHAEL for a scarlet, with Brilliant; Sir R. BAKER for a yellow, with Saffron; and for a fancy variety, with Benora.

In other classes, for amateurs only, the leading prize-winners were Mr. E. W. BISHOP, St. Leonard Road, Windsor; Mr. J. W. DRAKE, Shaftesbury, Mr. W. G. OAKLEY, Luton; and Mr. H. BLAKE, Alverstoke.

NON-COMPETITIVE EXHIBITS.

Many of the groups shown at the R.H.S. meeting of the previous day were left over for this occasion and they added very materially to the extent, beauty and interest of the exhibition. As these were described in our R.H.S. report (see p. 280) we have now only to give the names of the exhibitors. Awards were made only in favour of exhibits of Carnations.

Mr. C. ENGELMANN, Saffron Walden, Carnations. (Large Gold Medal.) Messrs. ALLWOOD BROS., Haywards Heath, Carnations. (Large Gold Medal.) Messrs. WM. CUTBUSH BROS., Highgate, Carnations. (Silver Medal.) Messrs. STUART LOW AND Co., Enfield, Carnations and Orchids. (Silver Gilt Medal.)

Messrs. SWEET AND SON, Whetstone, Heaths and Cinerarias; Messrs. W. WELLS AND Co., Merstham, Chrysanthemums. Messrs. KEITH LUXFORD AND Co., Sheering, Harlow, Chrysanthemums. Messrs. W. J. GODFREY AND SON, Exmouth, Chrysanthemums.

TRADE NOTES.

BY the terms of an order recently made by the Department of Agriculture and Technical Instruction for Ireland, which came into operation on the 15th ult., no Potatos may be imported into Ireland from any country except under licence to be obtained by the consignee in Ireland. Every consignment of Potatos imported must be accompanied by a declaration of the sender in a prescribed form. Forms of application for licences and forms of declaration can be obtained on application to the Department at Upper Merrion Street, Dublin.

THE catalogue of Messrs. Haage and Schmidt, of Erfurt, among other novelties, describes a new race of hybrid Pentstemons (P. hybridus Graciella), of varied flower, colour and graceful habit. The advantage claimed for this new race is its late flowering, which only ceases with the autumnal frosts. Plants raised from seed in gentle heat in February or March flower in September of the same year, and others wintered in the open begin to blossom in June and continue throughout the whole season

Obituary.

Thomas Bannerman.—It is with deep regret we learn of the death of Mr. Thomas Bannerman, who for over sixty years was gardener to Lord Bagot, Blithfield Hall, Rugeley, Staffordshire. Mr. Bannerman was a clever cultivator of Grapes, and for a long series of years he was a successful exhibitor of these fruits throughout the Midlands. He served his apprenticeship at Dunrobin Castle, and afterwards worked at Trentham Hall under the late Mr. Fleming. He was only 21 years of age

THE LATE THOMAS BANNERMAN.

when he went to Blithfield. Mr. Bannerman was a first rate all-round gardener, and an account of the work he had accomplished at Blithfield appeared in *Gardeners' Chronicle*, July 14, 1877, accompanied by the portrait now reproduced. It is of interest to record that the previous gardener at Blithfield occupied the position for over 50 years, and the fact that there have been but two head gardeners at Blithfield during a period of 110 years would appear to establish a record.

George Brooks.—The funeral took place on the 19th ult., of George Brooks, aged 86, who was employed on the Cliveden estate for seventy-four years under four owners, the last being Viscount Astor. He occupied the same cottage for sixty-three years, and worked up to a day or so before he died. Viscountess Astor sent a wreath inscribed, "With greatest respect for our faithful employee."

John Gray.—We learn that Mr. John Gray, who was gardener to Mr. and Mrs. John W. McConnel, at Wellbank, Prestwick, Manchester, for 35 years, died suddenly of heart failure on the 20th ult.

ANSWERS TO CORRESPONDENTS.

GARDENERS AND UNEMPLOYMENT ACT: *A. S. and W. J. W.* We understand that workers engaged in horticulture and farming, as well as other branches of husbandry, do not come within the scope of the Unemployment Act, which came into force on the 8th ult. You can obtain a copy of the Act from His Majesty's Stationery Office, Kingsway, W.C.2.

GRUBS ATTACKING CYCLAMENS. *T. S.* The grub attacking your Cyclamen corms is the larvae of beetle-like weevil; it is impossible to identify the adult from the larva. Presumably the attacked plants are grown in pots. If so, they should be repotted, if culturally possible, and the grubs picked out. A watch should be kept in the spring of the year for weevils on the foliage of plants inside the house. Their host plants should then be sprayed with lead arsenate to prevent egg laying for the following season.

HORTICULTURAL BOOKSELLER: *G. E. W.* We are of opinion that it would not be possible for you to build up a satisfactory business solely by the sale of horticultural books. Anyone starting such a business would need a large amount of capital and a vast amount of experience of horticultural and botanical books.

NAMES OF PLANTS: *W. C.* Salvia Horminum. *Country Cottage.* Cotoneaster Simonsii. This shrub may be raised easily from seeds sown in the spring, or by means of cuttings inserted in sandy soil out of doors during the autumn. Layers also root readily, and offer an easy means of propagation if only a few plants are required.—*J. R.* Lactuca sp.; the species cannot be determined in the absence of flowers. It is probably an introduced weed.

NAMES OF FRUITS.—*J. T. M.* Orange Pippin.—*E. M. S.* 1, Hambledon Deux Ans; 2, Calville St. Sauveur.—*W. H. S.* Pine Apple Russet.—*G. R.* 1, Lane's Prince Albert; 2, Fair Maid of Taunton; 3, Sam Young; 4, Nancy Jackson; 5, Round Winter Nonsuch; 6, Lady's Finger of Lancaster; 7, Bess Pool; 8, Duke of Devonshire; 9, Beurré de Jonghe.—*C. G.* Scarlet Golden Pippin.

NARCISSUS PSEUDO-NARCISSUS: *R. D. T.* If reference is made to the typical plant rather than to its many varieties it is probable that overcrowding and lack of moisture are the chief causes of non-success. If this deduction is correct no application of "food"—by which we assume you mean organic manures or other stimulants—is likely to prove of benefit. In nature the plant revels in cool moist soils, and in gardens is rarely happy for long if these conditions are absent. If your soil conditions approximate to these then overcrowding is responsible for the non-flowering of the plants. If this be so a further decline is inevitable. The remedy in such case lies in lifting, separating and replanting the bulbs singly. This could best be done at the time of the maturing of the growth, in June or early July. The best fertiliser to apply now would be liquid manure; drainings from a stable or cowshed. Copious applications of this twice weekly from now till March would assist growth materially.

SCOTS FIR ATTACKED BY INSECTS: *T. S.* The Scots Fir is affected with the Aphid Chermes pini. It is a fairly common pest of Pines which are not in a satisfactory cultural condition. They also attack this Pine in nurseries when the plants are unhealthy. Spraying could be resorted to in the case of young plants, but all that can be done with old trees is to see that the cultural conditions are satisfactory, *e.g*, that they are not unduly crowded by neighbours.

James Barnes

Gardeners' Chronicle 1874, n.s. 2

The subject of our present memoir, familiarly known amongst horticulturists as Barnes of Bicton, was born at Farnham, in Surrey, in the year 1806. His father was at that time gardener at Willey House, but he left Willey soon afterwards, and entered the service of the Rev. Mr. Onslow, Ripley, Surrey, and remained at Ripley till 1810. At this date the elder Barnes was engaged as manager to Mr. Lassam, who had established an extensive nursery at Witley, in Surrey, but the memorable severe winter which set in on Christmas eve, 1813, led to his removal from thence in this way: — The frost succeeded a mild wet autumn, and was ushered in by a terrible fog, which lasted from the 19th to the 24th of December, and was so thick and dense that many persons were lost by falling over chalk and stone quarries, or by walking into water. The intense frost lasted about fourteen weeks, and no other fuel was obtainable for the greenhouse furnaces but peat, which was got at with much difficulty, owing to the bad roads being blocked with snow (for it snowed some twenty-six days in the month of February, 1814), and, what was worse, the supply was soon exhausted. During all this time, owing, to the badly constructed flues and stokeholes, it was a terrible job to keep the fires going; and when the fuel was used up, nothing remained but to cover up the houses with straw, fern and snow. The plants were thus kept so long in this state that, what with freezing, dampness, and darkness, scarcely one was left alive in May. The severe losses, both indoors and out — for the frost was not out of the ground till late in May, and snow lay on north aspects and in dells the whole summer, so that there was no chance of planting that season after Christmas — compelled Mr. Lassam to retrench, and among other things Barnes' services were dispensed with.

Mr. Barnes' father now entered, in 1814, the service of Henry Gill, Esq., of Eashing House, Godalming, Surrey, as gardener. The boy, James, who had previously from about five years of age been chiefly employed in weeding walks and nursery seed-beds, and in bird scaring, was now fully employed in Mr. Gill's garden. Mr. Gill was at this time over 80 years of age and infirm, and his only daughter and heiress was married to Mr. Frankland, who resided with his father-in-law; but shortly after Mr. Gill died. Previous to this, however, plans had been prepared for Mr. Frankland with a view to the general renovation of the place; and the work, which had been commenced, was now carried on vigorously, the mansion being enlarged, and entirely new gardens, with pleasure-grounds, shrubberies, and plantations formed, and also a new park from the adjacent farm lands – the gardening portion of the work being executed under the superintendence of Barnes senior.

Mr. James Barnes, the immediate subject of our memoir, and whose portrait we subjoin, was from the first fully employed in and amongst these extensive works until 1818, when, wishing to go to London, to see the gardening wonders he had heard of as being carried out there, he walked off early one cold frosty morning in February, passing through several snow-storms in the course of his march, and arriving soon after noon in Chelsea, in time to seek for work, was engaged for the next day by Mr. Moore, of the King's Road, then a florist in an extensive way of business and cultivator of a host of herbaceous plants, and, at one of his grounds, of vegetables, salads, and fruits, including Pine-apples, Grapes, Melons, and Cucumbers for Covent Garden Market. Mr. Moore's home florist's grounds adjoined those of Mr. Davey, a noted Geranium, Tulip, Carnation, and Pink grower. On these grounds Downing's floor-cloth factory, which has since twice burnt down, was erected. Mr. Davey's grounds lay between those of Mr. James Colville and Mr. Moore; indeed, at that time the whole of the land right and left from Sloane Square to Fulham was occupied by florists, nurserymen, and market gardeners. Barnes lived with Mr. Moore until the death of the latter, and managed the business one year after for the widow. He then engaged himself to Mr. Stone, of Peckham, an extensive Pine-apple, Grape, and Mushroom cultivator, and who also grew salads very extensively, and forced Asparagus, Seakale, and new Potatos. Mr. Stone had a fine walled-in garden,

well stocked with fruit trees; also a nice extent of fine holding loam, for growing fruits, vegetables, and summer salads.

After a few years' practice with Mr. Stone, James Barnes undertook the superintendence of the forcing department for an extensive market gardener at Bermondsey, then called the Jamaica Level. After two seasons he made a new engagement with another market gardener at Greenwich to superintend the whole business, consisting of about 40 acres of garden ground, some 2000 lights of framing, 5000 handglasses for Lettuces, Cucumbers, Cauliflowers, with Asparagus forcing, Seakale, Mushroom, and small salad culture, and extensive crops of all outdoor vegetables in season, the land being variable, from stiff clay on the marsh side, to hot, light, gravelly soil, high and dry, on the other. His employer was an irritable, intemperate man, so after staying through two forcing seasons, Barnes left, and went to superintend the extensive work of forming the New Spa grounds at Norwood, Surrey, That finished, he was engaged by Mr. Hall Dare, Cranford House, Great Ilford, Essex, to succeed Mr. George Mills, who was then leaving for Gunnersbury. About four years later, on the death of Mr. Hall Dare, Barnes was engaged by the late Sir Herbert Jenner, Chislehurst, Kent, with whom he lived for four or five years. From thence he was engaged by the late Lord Rolle, of Bicton, in 1839, to succeed Mr. Robert Glendinning, and after the decease of Lord Rolle he continued to serve Lady Rolle until May, 1869, having thus had charge of this noble establishment for nearly thirty years. The treatment he received from Lady Rolle in the midst of severe affliction, brought on by over-exertion and unremitting labour, and which treatment led him to resign his appointment, is matter of legal history. But for this, he tells us, he should never have thought of leaving his favourite pursuits, which were so amply provided at Bicton.

We learn from Mr. Barnes, that throughout his long, practical, and somewhat varied career, he was never out of employment, but had always a situation ready for him to enter on the same day on which he left his former one; and, further, during the whole time he was blessed with vigorous health and strength, until he broke down only a short time before resigning his charge at Bicton, through excessive work, amounting to from 18 to 20 hours daily, sudden exposure to many varying temperatures, and constant changes from agricultural duties to every branch of horticultural practice, including floriculture, arboriculture, &c.

As reminiscences of his horticultural career, Mr. Barnes states that from 1818 to 1828 Cucumbers were extensively grown by the market-gardeners about London, both under frame-lights and under hand-lights. As fast as the Cauliflowers and Lettuces, which had been sheltered during winter in the frames, could be planted out in the spring, so that the frames could be spared, hotbeds were prepared, and Cucumber plants were ready to turn out under the lights.

“The same with all other lights, as they could be spared from forcing Asparagus, Seakale, early Potatos, Mint, Tarragon, Sweet Basil, Sweet Marjoram, or, in fact, as any lights became vacant, not a day was lost — hot well-worked London dung and plants and soil being ready; so that by May-day I have had under my charge from 1000 to 1600 frame-lights covering frame Cucumbers, and 6000— yes, 6000— hand and bell-glasses, all covering Cucumber plants on the ridging-out system. The Cucumbers grew luxuriantly, and bore abundance of fine healthy fruit almost on any kind of rich soil or situation in those days, and was very little subject to disease or vermin. Under the above system we began to cut about the middle of April in the frames, and about the beginning of June from the handglass ridges, some seasons ten days earlier. Thus, with the assistance of eight or ten men and women to collect and convey to the packing-shed, I have had above 8 tons of Cucumbers cut in one day. In those days the Gherkin Cucumber was extensively grown in the Fulham and Battersea fields, being sown down and hoed out on well prepared soil. From 1824 to 1828 I was very successful in growing early frame

Cucumbers, cutting good fruit by the end or middle of January, and with these I took many 1st prizes at the Chelsea, Battersea, Tottenham, Windsor, and other Cucumber clubs or shows, as they were then called, and which held meetings from about February 25 until March 8 or 10 each spring; There was in those days no other means but the use of fermenting materials by which to produce early Cucumbers, and with the appliances then available there must be neither neglect nor lack of practical knowledge if the grower wished to succeed.

I was very successful in crossing and producing improved varieties of Cucumbers. One, the handsomest and best quality Cucumber I ever saw, took. I believe, almost or quite every 1st class prize offered at all the shows at that time held about London. It was named at the Horticultural Society's Garden at Turnham Green, the Man of Kent, and was awarded a medal. I also raised at Bicton some good varieties of Strawberries, amongst them a beautiful white variety, named by Dr. Lindley at the Horticultural Society's meeting the Bicton pine; it is still largely in cultivation as a favourite, fine-flavoured fruit. The stock of plants of this Strawberry Lady Rolle sold to Messrs. Knight & Perry, then at the Royal Exotic Nurseries, King's Road, Chelsea, and took out the value in various plants for her establishment.

I also raised at Bicton that very extraordinary plant which Dr. Lindley named Colletaa bictonensis, a shrub which is at once a great curiosity and one of considerable value, as during the whole of the winter it is covered with its pretty white flowers, which in shape and size resemble those of the Lily of the Valley, and are just as sweet, so that when the sun shines out they perfume the atmosphere for a considerable distance. The whole stock of this plant Lady Rolle disposed of, in consideration £100 worth of plants in variety, to the late Messrs. Veitch & Son, of the Exeter Nurseries. Such was the encouragement I received from my employer for my perseverance and attention in raising new and improved fruits and plants.

I planted the noble avenue of Araucaria imbricata in Bicton Park. The first plant of Araucaria that produced female cones at Bicton grew in the flower garden, and was induced to do so on account of my root-pruning it, to prepare it for removal the next year into the arboretum— that is about thirty or thirty-two years ago. The sickly stunted plant it was to replace in the arboretum was removed with a large ball of earth to a well prepared situation in the new American garden, where it recovered and grew away most healthily and luxuriantly, and the second year proved to be a male plant and produced a quantity of male catkins. Some of them I lost no time in taking to the female cones, to fertilise them— a process which succeeded admirably. I also fertilised another batch of cones then on another fine plant at the head of the lake, and both succeeded well. Some of these cones, which were exhibited at the Regent's Park, weighed from 7 lb. to 8 lb. each. At the same time and place I exhibited a collection of about 100 species and varieties of Conifers which were coning in the Bicton arboretum. Araucaria seed was first saved by me at Bicton, and was sown, and plants raised from it; and there are now growing, or were when I left, plants from the first batch of seed large enough to bear cons and catkins, and thus produce grandchildren, as many of the splendid Conifers that I first raised and planted out have done. Thousands of these are to be found in the various plantations and around the parks, and hundreds of acres of the waste common and moorland could have been covered with them had there been any encouragement afforded to do so. It is easy to calculate the great value to which such now useless land would have reached in time. There are now to be seen about Bicton some of my first raised seedlings, quite timber-like trees, of Abies Douglasii and taxifolia, a noble and distinct variety, one of the very best, from 50 to 80 feet or more in height; also Picea cephalonica, large numbers of most splendid trees of my first seedlings; Picea nobilis, a grand lot, of various sizes and ages; Picea Nordmanniana, a splendid lot of fine healthy trees from my first batch of seed, and thousands in succession. I raised many of the

better species of Pinus, and Abies, Picea, Thuja, Cupressus, and various other rare and useful trees and shrubs; and I left the nursery well stocked with plants of all sizes, besides the seed-beds crowded with healthy seedlings.

In my time I have been a most successful cultivator of a great variety of plants, trees, vegetables and fruits; also a successful exhibitor at the shows of the Horticultural Society at Chiswick, at the Royal Botanic Society, the Egyptian Hall, Cremorne Gardens, Vauxhall Gardens, the Bromley and West Kent Society, and many others, with collections of stove and greenhouse plants, New Holland plants. Ericas, Geraniums or Pelargoniums, and of various new and well- cultivated plants — likewise of Peaches and Nectarines, Figs, Grapes, Melons and Pine-apples. I have grown the Providence to the weight of 14½ lb.; the Queen, but once, to 8¼ lb, but hundreds of Queens from 5 to 7 lb. each; the Enville to above 11 lb., the various kinds of Sugarloaf from 6 to 9 lb., the Smooth Cayenne from 8 to 11 lb., the Prickly Cayenne (a bad keeper) to 9 lb., the Montserratt from 7 to 9 lb., the Old Globe to 10½ lb., the Russian Globe to above 10 lb., and the Antigua, Jamaica, and several other varieties equally well swelled. I have also succeeded in raising some seedling Pines, crossed between the Enville and Black Jamaica, some of them not showing much improvement; but one, that turned more after the Jamaica, though longer or higher in pips, was a splendid winter-swelling and fine-flavoured variety".

Mr. Barnes claims to have established the first, or about the first, cottagers' and cottage garden exhibition in the county of Kent, nearly forty years ago. He procured some good garden seeds, which were given to the cottagers, with information how to sow them, and how to grow fruits, flowers, and vegetables. "It was truly astonishing," he remarks, "how attentive and industrious the cottagers became, and what splendid things they produced. Everything about the locality became improved, and the local nobility and gentry soon saw the improvement, and subscribed to support the society, while the exhibition day became quite an enjoyable holiday, as well as affording a profitable sight. On first entering Bicton I stated these facts to Lord and Lady Rolle, and offered to give assistance in every possible way to start such a society for the improvement of the poor, wretchedly-managed households and gardens of the surrounding dilapidated, neglected-looking villages; but to my great astonishment I received a flat denial, with the intimation that these folks knew too much already.

I was the eldest of five brothers, all of whom followed the horticultural profession, being first trained as boys under my father in succession; and then, being the eldest, and living in the vicinity of London, I took them all in rotation, and gave them a start in the world. All have filled good situations, but have been now for some years dead. I think I have entered and started in the world more young men as good practical gardeners than any other gardener in the United Kingdom. Mr. J. Taplin, who followed Sir J. Paxton at Chatsworth, began with me; also Mr. R. Westcott at the Duke of Cleveland's, Raby Castle; Mr. J. Snow, at Lord Morley's, Saltram; Mr. W. Bennett, at Mr. Bass's, Rangemore; but I need not enumerate the many scores I have started — all that are living are, I hope, doing well." Mr. J. Barnes was, we believe, one of the first to discover the Potato disease, and his pen has been a singularly fertile one. He has written a treatise on the growth and cultivation of the Pine-apple four times for various gardening works within these forty years, besides many calendars of general horticultural work, hundreds of natural history articles for various publications, and many papers on improved agriculture. He now lives in retirement at Exmouth.

HARDY FLOWERS IN LONDON GARDENS.

Vegetation in all its forms this spring is more backward than in previous years when the winters have been more severe, and even now near the end of May outdoor flowers are comparatively scarce, especially on badly-drained, stiff soils. In many of the small gardens near London may, nevertheless, be seen in good bloom such plants as Scilla nutans and S. campanulata, various kinds of Iris, Daisies, and other easily-grown plants. Amongst Tulips T. præcox, persica, and fulgens are attractive, as are also the scarlet-tipped, yellow-petalled flowers of T. cornuta, and the pale yellow blossoms of T. retroflexa. Iris susiana is now throwing up fine spikes of flower; some plants of it that have had the protection of a cold house have produced immense blooms; the beautiful blue-flowered

Presl's Catchfly (Lychnis Presli).

Annual Lupine (Lupinus bicolor elegans).

Gentiana verna is just now in great beauty, and the dwarf Phloxes, P. subulata, P. setacea atro-purpurea, and the white-flowered P. Nelsoni, are completely covered with bloom; the purplish flowers of Lychnis Presli, too, are opening in abundance, and the Alpine Lychnis (A. alpina) is densely covered with rosy-pink blossoms. American Cowslips are likewise in a forward state, especially Dodecatheon Jeffrayanum. On the Scarlet Geum (G. coccineum) quantities of blossoms may now be seen, and Saxifraga peltata is also flowering freely. Amongst the Globe-flowers, too, which are just now at their best, may be noticed the rich golden-flowered, dwarf-habited Trollius Fortunei. Several varieties of the Rock

Early Dwarf Pentstemon (P. confertus).

Limnanthes Douglasi.

Cistus are also flowering freely. Blooms of Narcissus juncifolius may still be gathered in good condition, as may also those of the White Wood Lily (Trillium grandiflorum). Ranunculus amplexicaulis is still in good bloom, and the small, double, pure white blossoms of R. aconitifolius are likewise abundant and highly valued by those who have small bouquets to make. Some of the hardy Lady's-slippers are well furnished with bloom-buds, while those of Cypripedium pubescens are already open. Polemonium reptans is flowering freely, as are also the yellow Lasthenias and the blue and white Nemophilas. Uvularia grandiflora is graced with drooping yellow blossoms, and several kinds of Fritillaria and the White Thrift (Armeria cephalotes alba) are likewise in flower. Primula erosa, too, is still attractive, as are also Ornithogalum umbellatum and O. balticum, both of which are bearing large clusters of white flowers. At Kew, the tall flower-spikes of Camassia Leichtlini are very attractive, being thickly beset with large, creamy-yellow blossoms. Pæonias are now very attractive, especially P. anomala and P. tenuiflora and its varieties. Aquilegias, too, are flowering freely at Kew, as is also the dwarf, sulphur-coloured Platystemon californicus. Large beds of a dwarf yellow Wallflower, named Ware's Tom Thumb, are very showy. For border edgings, for banks, or for pot culture, this Wallflower is worth growing, on account of its remarkably dwarf habit and floriferous character. S.

DEATH OF JAMES BARNES.

All acquainted with the best of what we are now beginning to call the old school of British gardeners, will hear with regret of the death of James Barnes, which took place on the 23rd inst. at Exmouth, at the age of 71. He has lived there in retirement since giving up the charge of the famous gardens at Bicton. Of these he had the management for nearly thirty years, and, as many of our readers know, under his charge they were among the most richly-stored and best-managed gardens in the country, the arboretum being probably the richest, and the kitchen garden one of the best cultivated in England. James Barnes, when young, had much experience in the best London market gardens, and evidence of this was seen in the thoroughness of much of his work. Beginning life with very few educational advantages, he took an intense interest in the literature of his work, and was a constant contributor of readable practical articles to the press, including The Garden, to which he gave his hearty support from the commencement. For a man who had no early advantage of travel to free him from prejudices, he to the end showed a singular freedom of mind in his determination to see anybody's practice likely to be suggestive, no matter where or by whom it was done. Thus, only a few years ago he made a long excursion round Paris, and examined the market and fruit gardens there with the greatest zest and interest. He was a close and constant observer of natural history, as shown in the lives of the birds and animals in the gardens and woods under his care, and contributed many instructive and interesting notes on those subjects to the "Field" and various other journals. It was interesting to those who had the pleasure of walking round the arboretum with him to notice that not a small bird showed itself on the boughs of the highest trees that he did not seem to instantly take notice of. So it was in the case of every other creature about the gardens or woods. Probably few of our readers will require to be told that he was the brother of William Barnes, who for many a day was considered the best plant grower about London. Like his brother, he was in early life blessed with a fine physique, and the story of his intelligence and energy was written in a fine face, like that of the stoutest type of Saxon, but lit up with a clear eye and the brightest intelligence. His success as a gardener, charm of manner, and pleasant writing are easily traceable to an inexhaustible stock of what, by an odd perversion of language, we are obliged to call common sense. The sad fact is that both the type of man (whose loss we now regret) and the sense are rare. James Barnes had gifts which, cultivated and exercised in other ways, would probably have made him famous far beyond what is possible in the walk to which his life was so conscientiously devoted. W. R.

Lime Juice and the Arctic Failure.—The failure of the Arctic Expedition is not due to any ignorance on the part of medical authorities of the main conditions essential to success, but to the deliberate disregard of such conditions by the commander of the expedition. The committee attribute the early outbreak of scurvy in the spring sledging parties of the expedition to the absence of Lime juice from the sledge dietaries. The committee find that the provision made by the Admiralty in the way of food, medicines, and medical comforts was in every respect adequate for the performance of the special service in which the expedition was engaged, and was more complete than had been made for any previous Arctic Expedition. The means, in short, were all at hand for obviating the disease which is the great enemy of all such enterprises; but, by a lamentable failure of judgment, they were not used. Sir George Nares took upon himself to neglect the positive advice of the highest medical authorities of the Navy, even when it had been officially recommended to his attention; and his reputation and the health of his crews paid the penalty.—"Times," May 19.

— We also record with deep regret the death of Mr. JAMES BARNES, so well-known as "Barnes of Bicton," who died at Exmouth on May 23, aged 71. Mr. Barnes was born at Farnham, Surrey, in 1806. How he laboured with his father in various gardens in Surrey; how he came to London when about twelve years of age, and was employed by Mr. Moore, a florist of that time residing in Chelsea; how he engaged afterwards in the service of Mr. Stone, of Peckham, a great Grape and Mushroom grower, and subsequently took the superintendence of a market garden at Bermondsey; then successively took charge of the gardens of Crawford House, Ilford, and of those of Sir Herbert Jenner at Chislehurst, from whence he entered the service of Lord Rolle, at Bicton, in 1839, is told by himself in the account of his life, furnished by his own pen, to accompany his portrait which was published in our series of British Gardeners, in 1874 (vol. ii. n.s., p. 655). Mr. Barnes continued to manage the gardens at Bicton with great credit to himself, and to the edification of his brethren of the horticultural fraternity by the detailed accounts of his practice which he published from time to time in the periodicals of the day, up to 1869, when he was compelled to resign his appointment under circumstances which attained a painful notoriety at the time. Since leaving Bicton, where his unremitting attention to his duties, early and late, seriously undermined his health, Mr. Barnes has lived in retirement at Exmouth, but was from time to time a great sufferer from a bronchial affection.

BARNES James.
Effects under £200.

16 March. The Will of James Barnes late of Hamilton-street Heaton Norris in the County of **Lancaster** Salesman who died 21 February 1877 at Hamilton-street was proved at **Manchester** by Anne Barnes of 29 Hamilton-street Spinster the Daughter the sole Executrix.

BARNES James.
Effects under £1,500.

10 July. The Will of James Barnes late of Exmouth in the County of **Devon** Horticulturist who died 23 May 1877 at Exmouth was proved at **Exeter** by Charles Edwin Ware of the City of Exeter Surveyor and John Vanstone of Cleave in the Parish of St. Thomas-the-Apostle near Exeter in the said County Nurseryman the Executors.

BARNES James.
Effects under £100.

19 September. Administration of the effects of James Barnes late of 35 Bottomgate Blackburn in the County of **Lancaster** Fish Hawker a Bachelor who died 2 September 1877 at Morecambe in the said County was granted at **Lancaster** to Nancy Barnes of the "Pack Horse" Inn Blakey-street Blackburn Spinster the Sister.

BARNES James.
Effects under £200.

5 October. Administration of the effects of James Barnes late of 4 Osborne-terrace Southsea in the County of **Southampton** Pensioner Master-at-Arms Royal Navy who died 13 September 1877 at 4 Osborne-terrace was granted at **Winchester** to Elizabeth Barnes of 4 Osborne-terrace Widow the Relict.

BARNES James.
Effects under £100.

23 November. The Will of James Barnes late of Dinton in the County of **Wilts** Shopkeeper who died 15 July 1877 at Dinton was proved at **Salisbury** by Mary Barnes of Dinton Widow the Relict the sole Executrix.

BARNES Jane.
Effects under £300.

3 August. The Will of Jane Barnes late of Radnor-street Southsea in the Parish of Portsea in the County of **Southampton** Widow who died 22 June 1877 at 20 Radnor-street was proved at **Winchester** by Frances Tomes of 10 Radnor-street Widow and David Evans of 21 Froddington-road Southsea Shipwright the Executors.

BARNES Jane.
Effects under £800.

14 August. The Will of Jane Barnes late of 7 Rochester-terrace Camden New Town in the County of **Middlesex** Widow who died 9 July 1877 at Lucan near Dublin in Ireland was proved at the **Principal Registry** by Robert Mansel Brown of 9 Lime-street in the City of London Merchant and the Reverend Richard Galbraith of Carrickmacross in the County of Monaghan in Ireland Clerk the Executors.

BARNES John.
Effects under £1,500.

10 January. The Will of John Barnes late of Cornwell in the County of **Oxford** Farmer who died 2 December 1876 at Cornwell was proved at **Oxford** by William Henry Goffe of Radford near Enstone in the said County Farmer and George Henry Saunders of Chipping Norton in the said County Solicitor the Executors.

THE GARDENS AT THE PRIORY, DUDLEY.

Interview with Mr. Walter Barnes.

BY the courtesy of Mr. G. H. Claughton, I had the opportunity of visiting Dudley Priory, once the home of the monks of the Cluniac Order. Founded in the year 1116 by Gervase Paganel, "the Monastery of St. James of Dudley," as it was originally called, has a past full of interest. It was dissolved early in the sixteenth century, and in the year 1540 it was granted, by Henry VIII., to Sir John Dudley, afterwards Duke of Northumberland. Following the attainder and forfeiture of the Duke of Northumberland, the greater part of the possessions was bestowed by Queen Mary upon Sir Edward Sutton, Lord Dudley; and from that time since it has been the property of the Earl of Dudley. The present noble-looking house, in which Mr. Claughton, agent of the Dudley Collieries, resides, is called Priory Hall; and Dudley Castle being, of course, in ruins, it is the only dwelling-place on the historic ground. I did not go to Dudley to see the remains of the celebrated castle, but it was impossible to visit the gardens at Priory Hall without a glance at the portions of the ancient Priory which are enclosed in the pleasure grounds. In fact, on my arrival, Mr. Walter Barnes, the gardener, naturally suggested that I should first see the ruins which, with those of Dudley Castle, attract thousands of people from all parts of the world during the year. It is almost but not quite needless to say that no attempt has been made to embellish them. They have simply been preserved, at any rate in recent years, as they were generations ago. Walking down the Castle Drive, which faces the Castle, we speedily reached the ruins, of which the old chapel of ease is conspicuous. On a wall of the main fabric is a fine piece of carving; the beautiful Gothic east window, with a niche and canopy for an image on one side of it, is still in existence; and stone coffins, one with a lid, are amongst the memorials of a dead past. The pools which were formerly adjacent to the ruins were drained when the Priory Hall was erected.

The Treatment of Rhododendrons.

"What are the principal trees in the vicinity of the ruins?" I asked.

"Wych Elms. As to shrubs, the most notable along the carriage drive are, as you see, Rhododendrons. The natural soil is clay at the bottom, and loam on the top; but I made the soil for the Rhododendrons. It consists of peat, loam, and leaf-mould. I plant them in holes four feet square and two feet deep. They are all choice hybrids, and they flower well, but do not come into flower until quite the end of May."

"Ivy appears to do well."

"Yes; we have no difficulty with it, and the large Ivy bed under the trees merely wants keeping trim. Hollies, you will observe, also thrive on the south side of the Hall, which is nearest the drive; and in this locality are a few Beeches and Limes."

"Do you naturalise Daffodils in the borders under the hedge of shrubs?"

"Largely. At present there are the remains of the summer bedding, which consists of Calceolarias and Marguerites, edged with Violas Countess of Hopetoun and Councillor Waters on one side; and Stocks Beauty of Nice, mixed seedling Verbenas, and Petunias on the other. Herbaceous plants are also used in the border, with Pentstemons in variety. I grow Pentstemons from packets of seed, and select the cuttings from the best flowers."

"How often do you mow your great lawns?"

"Once a week. They are always kept in good order. You may like to know that in August and September the Priory gardens are open on Wednesday afternoons to the public."

MR. WALTER BARNES.

A Border facing East.

"How do you fill the long border on the other side of the Hall in spring?"

"Entirely with Wallflowers, Blood-red, with the result that we get a splendid mass of colour. In summer the border contains, in front, Geraniums John Gibbons, Jacoby, Raspail—some are still in flower—and Calceolaria floribunda, with Lobelia Lustrous in front. The Lobelias are grown from seed. Behind them are Phlox, Heleniums, and Michaelmas Daisies in variety. You can imagine that there are difficulties with this border, which not only faces east, but is constantly wind-swept."

"There is little in the way of creepers on the house?"

"Only Ampelopsis Veitchi on the south side. There are some vases in front, which we fill with Geranium John Gibbons, and Petunias, edged with Lobelia Lustrous. Petunias stand well."

"Is there a conservatory?" I enquired, as we proceeded to the frame yards.

"No. All the flowers are grown for decorating the rooms in the house. We have a few Arum Lilies, and in the frames just now are winter-flowering Geraniums, Paul Crampel, Jacoby, and John Gibbons. Cinerarias, the large-flowering, and stellata, some in 8-in. and others in 7-in. pots, are grown."

"And Primula obconica, which are looking exceptionally healthy?"

"Some of the Primulas are my own seedlings, and others I bought. Though I constantly handle the plants, I never suffer from the poison which affects some people. There are a few plants of P. kewensis."

Late-flowering Chrysanthemums.

"With regard to our Chrysanthemums," continued Mr. Barnes, as we entered the early Vinery, which was gay with blooms, "we keep them back as much as possible, so that they may come on when other flowers are scarce. For this purpose the best varieties are Mrs. Thirkell, Queen Alexandra, Mrs. Barclay, Raphael, Mrs. Cadbury, W. Duckham, Mrs. George Mileham, Florence Penfold, Mrs. Walter Wright, Madame P. Radaelli, F. S. Vallis, Madame G. Rivol, F. W. Vallis, Madame Oberthur, and Dorothy Pywell."

"How long have the Vines in this house been planted?"

"Probably half a century. The varieties are Black Hamburgh and Alicante. One of the Black Hamburgh bears fruit earlier than the other. There are inside and outside borders. I always top-dress the beginning of December, before I bring the Chrysanthemums into the house."

Ferns for Cutting.

"Ferns seem to be one of your features?"

"Mr. Claughton is interested in Ferns. He brought home from Greece four plants of one variety. The plants in the Fernery are chiefly Adiantums, which are specially useful for cutting. Of Begonias, I like the Rothschild variety better than Gloire de Lorraine."

"Can you give me any idea of the age of the Hibiscus in the stove?"

"The original plant is about ten years old. It came in a pot from the gardens of Mr. Claughton's villa at Cannes. The variety is H. rubra flore pleno. In the stove, also, are Palms, which we use for the house, and on the roof is Allamanda Hendersonii."

"Do you ripen the Banana?"

"Although the leaves look so healthy, I cannot get fruit from it. The Caladiums, especially bicolor, do well; and Crotons, with a few Orchids, chiefly Lælia-Cattleya and Dendrobium nobile, give us a good supply for the tables. But we do not make a feature of stove plants."

"You grow Cucumbers in the frames?"

"Yes, Telegraph and Lockie's Perfection, cutting about the beginning of April. Also in frames we have Potato Duke of York, ready in May; Carrots, Early Gem; and Lettuces, Tom Thumb and All the Year Round. I have grown these for several years on practically the much-vaunted principle of so-called French cultivation."

"How do you treat your Hedychiums in the late Vinery?"

"The most important point is to give them

Digitized by Google Original from CORNELL UNIVERSITY

plenty of water when they have four inches of growth. They are grown in pots, and the variety is H. Gardnerianum. It flowers in July and August, throwing out spikes of yellow bloom, with a fragrant perfume. The Hoya carnosa on the wall flowers in July, and it is quite clear that the shade of the Vines suits it. The Geraniums in flower are Raspail, all spring cuttings, and at the bottom Virginia, single white, and Cygnet, double white. The Vines are Buckland's Sweetwater, Black Hamburgh, and Alicante. We begin cutting Grapes in June, and go on until the end of November. Tomatoes are grown at the end of this Vinery. They will not do outside, and in this bleak country we have to turn the glass to the best account we can. The Tomatoes are Ideal and Holmes' Supreme. There are plenty of bunches with a dozen fruits."

Brilliant Begonias.

We next inspected the greenhouse, and here I expressed my admiration for the fine show of Begonias.

"Some of these plants," said Mr. Barnes, "I have had for seventeen years, as, for instance, the golden flower, Empress of India, Pink Perfection, and the orange Sir Blundell Maple. Nearly all these are my own seedlings."

"How many plants are there altogether?"

"Including the Frilled Begonias, about a hundred and fifty. I start them in March, and keep them dry in pots or boxes all the winter under the stage in the late Vinery. When the bulbs are large, I divide them. I have tried them three times out of doors, but they will not do. We have a good show in the house during August and September."

"You have a fine plant of Heliotrope in the greenhouse?"

"We get masses of flowers from it for months. I do not know the variety or the age, but the roots show that it is quite a quarter of a century old. But now, I think, we had better look at the flowers outside in the kitchen garden. Chrysanthemums do fairly well, the varieties being chiefly Ralph Curtis, Horace Martin, O. J. Quintus, Mrs. Thompson, Lillie, Pride of Keston, Clara, Goacher's Crimson, Madame C. Perier, Esperanto, Harry, and Carrie."

"I observe that you grow Chrysanthemums on wires."

"Yes, running from post to post. If we did not, they would be blown to pieces by the south-west wind. They stand on trellises six feet long, and the air passes under the pots. Under the trellises is a flat piece of wood to keep them in place."

Sweet Peas and Dahlias.

"How do you arrange your Sweet Peas?"

"Some in clumps and some in rows. We grow a number behind the Dahlias, and get them nine feet high. These varieties are King Edward VII., Lady Grisel Hamilton, and Dorothy Eckford. Other varieties, including Mrs. Hardcastle Sykes, and many of the most popular, are grown elsewhere. The Dahlias are all the Cactus section, and include several seedlings. Perhaps the best named varieties are Major Atkins, Florence Stredwick, Matchless, Mrs. A. Part, and H. J. Jones. We cut all the Dahlias for use at the harvest festivals."

"I should like to know how you treat your Antirrhinums, which are still flowering bravely."

"For late flowering they are sown in April. I treat them as an annual, because they will not stand as a biennial. The white variety in front of the border is The Bride, the crimson in the middle is Crimson King, and the yellow at the back, Yellow Queen."

"The soil also seems to be appreciated by Violas."

"The Violas are all grown from cuttings. The best yellow for edging is, I think, Bullion; a very fine mauve is John Quarton; White Lady and Seagull are good whites; and Mrs. Chichester a very fine blue and white. The breadth of Asters chiefly consists of Victoria; the Stocks of Beauty of Nice and the Ten-week, the former being much the better; Mignonette is grown in quantity, also seedling Verbenas. Pentstemons, still in flower, are much appreciated for cutting."

Failure of Fruit Crops.

"What about fruit and vegetables?"

"So far as crops are concerned, I can only say that the frost has spoilt our fruit crops. Both Apples and Pears are grown on cordons on the walls, a system by means of which you get more fruit and larger. The best varieties of Apples, we find, are Golden Spire, King of the Pippins, Duchess of Oldenburg, Lord Derby, Newton Wonder, Cellini, Stirling Castle, Cox's Pomona, and Cox's Orange Pippin. As to Pears, perhaps the three best are Louise Bonne of Jersey, Marie Louise, and Pitmaston Duchess."

"How late can you pick Peas?"

"Up to the middle of October. Our latest variety is Gladstone. We also grow in succession, Harbinger, Pioneer, The Pilot, Eureka, Daisy, Duchess of Albany, and The Clipper. We pick Scarlet Runners up to the end of October, unless the frost intervenes, the varieties being Hackwood Park and Empress. As far as possible we ripen our crop of Onions in the sun. The varieties are Ailsa Craig and Bedfordshire Champion. We have more vegetables in the Rose garden, which still remains to be seen."

PRIORY HALL, DUDLEY.

Roses in the Black Country.

We accordingly left the kitchen garden, crossing the road and a meadow in order to reach the piece of land which was acquired seventeen years ago under the shelter of the Wren's Nest, a south-west hill. The land is wired in order to keep out the hares, but there is one thing which apparently nothing can keep out. The wind is almost over-powering, and I was not in the least surprised when Mr. Barnes informed me that he was about to put up a fence in the hope of breaking its force."

"What sections," I asked, "are represented in the Rose garden?"

"Chiefly Hybrid Perpetuals and Hybrid Teas, a number of Ramblers being grown on poles. This open field was only utilised for Roses after I had made several attempts to grow them in the wall garden without success. In 1905 I planted the first Roses here, and I was quite satisfied with the results."

"How did you make your beds?"

"I took out a trench two feet wide, and one foot deep. I then dug up the bottom, subsequently placing over the beds some good rotten horse manure. The top soil is a stiff, greasy loam, and the bottom a marly sand, which sets like stone if placed on the top. With regard to further preparation, I take out a hole one foot deep, and one foot six inches wide, so that the roots can be well spread out. Then I put in six inches of half-decayed leaf-mould, place the plant in the centre of the hole, add six inches more leaf-mould, fill in with soil, add a handful of bonemeal, tread firmly if the ground is not sticky, stake each plant, and cut long shoots down to about two feet six inches, trimming all the leaves off."

"What is your distance from plant to plant?"

"Two feet; and four feet between the rows. I find that the best month to plant is in November. For protection in winter, I place four inches of straw litter round the plants. I begin pruning in April, and go on according to the weather, pruning each variety as the strength of growth requires, the primary object being to obtain as many flowers for house decoration as I can."

"What about feeding?"

"I use one of the patent manures in February, and again in May; also after the summer bloom. I ought to have mentioned that after the ground has been made for Hybrid Teas, I fork in leaf-mould, sand, and bonemeal. In December I dress with soot to keep away mildew; and in March I spray with Abol, and dress with fresh slack lime, which I hoe in. The ground is hoed every fortnight, and as it is not more than twelve inches deep, I am raising it to two feet six inches. I think by this plan I shall get better flowers."

The Best Varieties.

"As so many people scarcely believe that Roses can be grown in the Black Country, it would be interesting to know the names of your varieties, especially as the plants look so remarkably healthy."

"The Hybrid Perpetuals include Abel Grand, Neige, Dr. Andry, Duke of Edinburgh, Dupuy Jamain, Etienne Levet, E. Y. Teas, Heinrich Schultheis, John Stuart Mill, Lady Helen Stewart, Magna Charta, Rev. Alan Cheales, and Suzanne Marie Rodocanachi. Of Hybrid Teas the best are Betty, Dean Hole, Duchess of Albany, Ecarlate, Edith d'Ombrain, Gruss an Teplitz, Gustave Regis, Kœnigin Carola, Lady Ashtown, Lady Battersea, Liberty, Madame Jules Grolez, Madame Melanie Soupert, Marquise of Salisbury, Mamie, Mrs. G. W. Kershaw, William Shean, and Warrior."

Digitized by Google Original from CORNELL UNIVERSITY

"How large is this piece of land?"

"Two acres and a half. We utilise it further for vegetables chiefly, but Border Carnations, the Shasta Daisy, Chrysanthemums, Weigelas (for cutting), and a number of seedling Hollyhocks are also grown here. I hope the last will flower next year."

"In addition to your vegetables, you have also Strawberries. What are the varieties?"

"Royal Sovereign and Givon's Late Prolific are the two best, but I am also trying Bedfordshire Champion, Progress, Laxton's Latest of All, and Waterloo. The vegetables include a few more Peas, such as Webbs' Scimitar and Glory of Devon; Parsnip, Hollow Crown; Cabbages in variety; Broccoli, Leamington, Safeguard, Late Queen, and Snow's Winter White; Savoys, Drumhead, Dwarf Blue, and Ormskirk; Kale, New Heart; Brussels Sprouts, Wroxton and White Sprouting; Cauliflowers, Autumn Giant, Veitch's Self-protecting, Sutton's Mammoth, and Early London; Celery, Standard-bearer, White Gem, and Pink Gem; and Potatoes, which were planted on July 7th, and are now being got up."

Difficulties of Cultivation.

"I think I need not ask you whether the smoke of the district affects your Roses; but I suppose it does sometimes constitute a difficulty?"

"Unquestionably the sulphur in the air is a drawback in outdoor cultivation, if only because it takes all the colour out of the white flowers. Then, of course, a good deal of soil has to be imported. For example, when I made the border in the kitchen garden, where the fruit is planted, I took out all the old soil and put in its place loam brought from Himley Park, four miles the other side of Dudley. Before I came here I was foreman at Himley Hall Gardens."

"How long have you been at Priory Hall, Mr. Barnes?"

"Seventeen years; but I have been with the family forty years, practically all my life. For some years I have done a good deal of judging. This year a new departure was made by the North-Western Railway Company (of which Mr. Claughton will be chairman next year), who are giving prizes for the best-kept and planned station garden. Through Mr. Claughton, I have judged the flowers at Gailey, Prince's End, Ockter Hill, Great Barr, Menton Road, Gravelly Hill, Erdington, Haukbury Lane, Dunchurch, Marton, and Berkswell, and have found the work very interesting."

ALFRED WILCOX.

NEXT week, "Garden Seed Adulteration" will be dealt with in the course of an interview with Mr. Edward Owen Greening.

Ornamental Trees.

FRONT gardens are generally planted with at least a few ornamental trees, but the choice made is sadly monotonous, the same species appearing in most cases, while admirable kinds remain almost unknown. For these reasons the maker of a new garden, large or small, or the renovator of an old one, should select some novel or neglected trees. Obtain these of a fair size to start, and there will then be ample reward for the money spent.

The Golden Maple, Acer negundo californica aurea, is a magnificent golden subject, of strong, vigorous growth, too. It can be purchased six feet high, and cannot be too much commended. It is related to the silver, trembling shrub, Acer negundo variegata, that is rather less robust, but very beautiful, also. The Maple that flushes scarlet and gold in autumn, and has tinted leaves in its young spring robes, is Acer colchicum rubrum.

The Weeping Ash, Fraxinus excelsior pendula, was more planted by our grandfathers than by us, yet it gives an original beauty when placed on a lawn, or close to an entrance gate, and specimens eight feet tall can be safely moved, so a quick effect is gained. The yellow-berried Mountain Ash, Pyrus aucuparia fructis aurea, is a decided novelty. The Chinese Cherry, Cerasus serrulata alba fl. pl., carries its double white blossoms in spring in pendant clusters, which distinguishes it in effect from more familiar members of its family.

Golden Elms are good for forming hedges, when clipped to the required height, or may be recommended as specimen trees on large lawns. The finest-coloured variety is Ulmus campestris van Houtte; Ulmus americana aurea is, perhaps, a quicker grower, so more suited to the first purpose. There is also an attractive silver-margined Elm. The scarlet American Oak makes a showy front garden ornament, as it has gigantic leaves, coloured with rich crimson. This, too, can be obtained as an 8-ft. specimen. The scarlet-berried Elder, Sambucus racemosa, may well be planted next to its brother, the Golden Elder, which has now, fortunately, become a familiar feature of front gardens in town and country suburbs. The Cut-leaved Birch is of wondrously elegant appearance, yet remarkably strong, so suited to exposed positions.

Purple-flowering Laburnum invariably attracts admiration, yet a 10-ft. specimen costs only half-a-crown, and would flourish in any ordinary front garden with a south aspect. It is an excellent plan to pair it, against the gateway, with the common Laburnum, as an example of how species differ. In some damp gardens, especially near water, whether natural or artificial, a group, or even a single specimen of the Golden Willow, will have a beautiful appearance in sunlight.

HOBBY GARDENER.

ANOTHER VIEW OF PRIORY HALL, DUDLEY.

On Pruning.

A GREAT deal has been, is, and will be, written on this subject, and elaborate rules have from time to time been laid down regarding the methods to be pursued in pruning different kinds of trees, in order to obtain the very best results. Broadly speaking, pruning is a very simple business. It needs only to be done with due consideration to the objects in view. These may be various, but the principal are pruning for fruit, and pruning for foliage. Some trees fruit on the first, and some on the second year's growth, but this is soon observed by the attentive grower, and will make little or no difference to the broad principles to be considered in pruning.

Pruning for Fruit.

The chief consideration in pruning for fruit is to so train the tree as to get the greatest possible amount of air and light to every part. Where do we get the best fruit? First—On single cordons or one-stemmed trees; second—on ordinary cordons, or what may be called wall trees trained on wires in the open; third—wall trees; fourth—bush and standards. In each of the first two cases they have the maximum amount of light and air; in the second two cases they are more sheltered, though the wall trees get more than the bushes.

Now, when we wish to prune any of these trees, we must ask ourselves the question: "What must be done to give this tree the maximum of light and air?" We shall find that the answer comes: "Take out any branches that are crossing or crowding the tree in any way." But, whatever is done, do not make the mistake of cutting off the tip of every branch. This tends to growth and crowding, but not to fruitfulness. Some men go regularly round their trees about this time, neatly cutting the tips off in a beautifully even manner, so that when they have finished, the trees resemble an example of topiary work. The result of this is to cause two branches to come out of each one below the cut, besides greatly tending towards more coming out below. This is exactly the opposite of what we want, and will produce in the end merely a tangle of growth, or, if we cut out again, it involves an enormous waste of strength to the tree; but it shows us that we can easily fill up a vacant space in any tree by cutting a branch back hard, and training the offshoots into the bare spot.

To sum up—the two things to remember are to thin out well, and not to cut the ends off the branches.

Pruning for Foliage.

This is almost the reverse of the last, as we want all the strength of the shoot we can get, so we must prune hard, thus making the growth come more. The weaker the nature of the plant, the harder must we prune it. This is the method to pursue with Roses and such-like plants, where we are anxious to get good, big blooms on the end of long stems. Every sort of tree differs on different soil, and will need slightly more or less pruning; but, in the main, the above treatment will result in the best all-round results.

S. N. W. T.

take any food from the others, so if that were the only consideration it would not matter when they were cut out; but they intercept a certain amount of light and air, and for that reason it is best to remove them as soon as they have ceased to serve a useful purpose—that is, as soon as the crop has been gathered. The young canes, of course, require different treatment. Of those that grow up in the rows some can be seen at once to be too thin to be of any value. If they are allowed to remain they will be using up food all the summer, and as they must be removed in autumn or winter, the plants will have been wasting their energies on the production of useless material. Obviously, then, the sooner they are cut out the better. A number of other canes, sometimes very strong ones, always spring up between the rows. They are situated on the roots, between the tips which gather in the supplies and the canes in the rows which those supplies should reach, and from their position they are able to take a heavy toll of the food which is passing along the lines of communication.

MOSS ON PATHS.

June 7th.—Though moss on paths is not out of place in certain parts of the grounds, in the more remote shrubberies and under trees, it is certainly objectionable near the house, as it gives an appearance of damp and neglect. Unfortunately, it is not so easily got rid of as ordinary weeds. A weed-killer will kill it, no doubt, but the brown cushions of dead moss which remain are no improvement on the live green moss. These cushions are firmly attached to the ground, but can be worn away in time by brushing with the stump of a broom; if that is too slow a process, the ground must be turned. This is best avoided in summer, because if the weather happens to be dry the gravel may remain loose for a long time, but a heavy shower or two will allow of its being rolled down firmly if it is of a binding nature—that is to say, if it contains an admixture of clay.

H. C. DAVIDSON.

ARALIA SIEBOLDII.

This very popular room plant, often called the Fig-leaved Palm, and by botanists known as Fatsia japonica, sometimes gets into bad condition through neglect and carelessness in watering. In summer, when it is making its growth, and putting forward its handsome, glossy, bright green leaves, it should be well supplied with water, but the soil must never be allowed to become sodden. The leaves, too, if the plant is kept indoors, should be regularly sponged over, using tepid water. This improves their health, and freshens their colour.

This plant has a tendency to go leggy, the leaves falling from the lower part of the stem, which thus looks bare and unsightly. This cannot be prevented with pot plants, and the only remedy is to take off the top, insert it in sandy soil, and strike it in gentle bottom heat, when it will soon emit roots, and can be potted up and grown in the usual way.

Where a greenhouse is not available, and bottom heat cannot be provided, the plant can be reduced in height quite easily at this season by the process known as stem-rooting, which may be carried out in a sunny window. Cut half-way through the stem in an upward direction, forming a tongue, and insert a small stone to keep the cut open. Then surround the part with moss, which must be kept uniformly moist. In a little while roots will have formed, and the plant can be potted up. Instead of moss, a small flower pot can be cut vertically in half, and secured to the stem, being filled with very sandy soil, and kept moist until roots are formed.

This graceful plant can be grown out of doors in sheltered places, and will take no harm in winter. Even if cut down by frost it will break up from the base.

TO carry on a large garden with a greatly reduced staff has been the experience of most gardeners during the past four or five years; but to Mr. A. J. Barrett, who is in charge of the gardens at Bedfords, Havering-atte-Bower, it also fell that he himself was called up when the age limit was extended to include the older men. How the gardens have fared, what things have been done, and what left undone, Mr. Barrett explained to me when I called on him at the beginning of April, shortly after he had been demobilised.

Havering-atte-Bower is a pretty village three miles from the old market town of Romford, in Essex. At one time it was a place of considerable importance, and remains are pointed out which, tradition asserts, once formed part of the palace of Edward the Confessor. Bedfords (the name is said to have been originally Belfonts, from the number of its springs) is the residence of Sir Montagu C. Turner, and stands in a park of nearly one hundred acres. Situated on high ground, giving views across the Thames to the hills of Kent, with a vast panorama in between, it is exposed to all the winds that blow, and fully tests the hardiness of the trees and outdoor plants. A public footpath runs through the park, and this, on the occasion of my visit, was gay with Daffodils just coming into bloom.

MR. A. J. BARRETT.

LADIES HELP.

"The ordinary staff consists of eight or nine men," said Mr. Barrett; "but during the war this dwindled down until, at last, there remained only myself and an old man. Then, last summer, I was called up, and during the winter the sole survivor was ill for a long time, and finally left. Of course, nearly everything except the kitchen garden and orchard had had to go."

"How did the gardens get on after you went?" I asked.

"My wife and boy did all they could to keep things going, and the ladies of the house gave help as well—in fact, they helped before I went away. Luckily, I was stationed in London, and so whenever I could get week-end leave I ran down and did what I could. I have now been home for a little while, and as we have managed to get a couple of our men back, we are making headway with the necessary work."

Evidence was quickly forthcoming of Mrs. Barrett's able assistance, for in the first house we entered was a nice batch of young Malmaison Carnations, of which she had struck the cuttings.

"We used to have a nice stock of these," said Mr. Barrett; "but lost most of them. In the next house, which was the Cucumber house, we now have Chrysanthemums coming on. Among the varieties are many Decoratives, Singles, and large-flowered Japanese. Queen Mary is one of Sir Montagu's favourites. The Caprice family, Mensa, Nellie Pockett, Phyllis Broughton, and Roupell Beauty are others liked; but all the varieties are good."

On the wall of what used to be the Melon house I noticed a lot of healthy-looking Kalosanthes, and of these, I was told, a large number were formerly grown.

ORCHIDS HAVE TO GO.

The next house told a further story of the losses arising from shortage of fuel, the Orchids which were once its chief occupants having suffered severely.

"The Vandas and Dendrobiums were very choice, but it was not possible to save them, and they are gone altogether, through our having no fire here. The Cypripediums were not so badly affected, and I have no doubt they will recover. We have now a little heat on, just sufficient to keep the Ferns alive—they were brought in here to save them. We have not been without flowers, however, for Primula obconica has been very fine. We have a splendid strain of this."

"You have also a good batch of Tomatoes?"

"Yes; it is really for them that we have had a little fire heat. The varieties are Sunrise and Golden Sunrise."

"Is the golden variety liked as much as the other?"

"Quite; and the colour makes a pleasing change. It is as free as the scarlet, but is not, perhaps, so seeded."

Outside, in frames, plenty of Cauliflowers, raised and just pricked out by Mrs. Barrett, indicated that there will be no scarcity of that vegetable. The variety, I was informed, was Magnum Bonum, "one of the finest in appearance and quality."

THE KITCHEN GARDEN.

In vegetables and fruit Mr. Barrett has made a name for himself in the short time—under four years—that he has been at Bedfords. He has exhibited at the Royal Horticultural Society's great shows of vegetables and of British-grown fruit, and has been successful in several classes, particularly with Apples and Pears. It was, therefore, with especial interest that I listened as he explained some of the methods while we walked round the kitchen garden, into which we next turned. This occupies a space of two acres inside the walls, and there are several large areas outside. The walls, by the way, belong to a period when greenhouse heating was on primitive lines, for

are not referred to in any cookery-book that I have yet met with. Proof of what I assert is open to every one. You have only to deprive yourself at your breakfast to-morrow morning of a dozen heads out of your dish of watercresses. Before you begin, put half-a-dozen heads upon a plate, and over them sprinkle some salt; put the other half-dozen upon another plate, but put no salt over them; when you have finished your breakfast compare the contents of these two plates, and also taste them. Your eye and your mouth will agree in asserting that the salt has converted a crisp, juicy, tempting vegetable, into a flabby, washy, and unsightly mess.

How often do you see a salad sent to table fit to eat, if it has been dressed in the kitchen? My experience answers, not once in a hundred times; and is not that yours, gentle reader? And why is this? Simply because the fresh vegetable has been salted for half-an-hour before it was served to you.

The gardener may spend his master's money in buying seeds of all the varieties of Lettuce, Endive, Cucumber, and other saladings; — he may pride himself upon the earliness of one and the lateness of another, upon the whiteness of this and the greenness of that, upon the flavour of this variety and upon the cold juicy crispness of that;—he may have applied to the growth and perfection of certain kinds the thought and experience of many years of labour and observation; and all his anticipations of giving pleasure and satisfaction to his employer are knocked on the head by the thoughtfulness (?) of the cook, who (in order to be well forward with her work) salts the salad or the Cucumber half-an-hour or more before it is to be eaten, though in this she only follows the instructions of the books and of her preceptors by beginning with the use of pepper and salt, and subsequently pouring over vinegar and oil!

Upon another occasion I propose to explain how, in my judgment, uncooked vegetables ought to be served. The subject I now have before me is not salads but salt. And gardeners, who desire that the saladings they have grown should be served to their masters in perfection, should lose no time in impressing upon the cooks for whom they have to provide, that salt should never, under any circumstances whatever, be added to raw vegetables until the very last minute that it is possible to do so before it is to be eaten.

Every cooks knows that all combinations of eggs, milk, and flour, require to be served immediately that they are cooked, as they so quickly become sodden; batter puddings, fritters, pancakes, and omelettes of various kinds, are all dishes of which the cooking is put off until the last moment; and all who enjoy these preparations will agree with me that they had much rather be kept waiting a few minutes for a pancake or an omelette, than that it should be half a minute in the room too soon. Let the gardener remind the cook of these facts, and at the same time explain to her that the premature use of salt over green vegetables will as certainly injure his credit as a grower, as the premature cooking of an omelette will affect her credit as a good cook. *W. T.*

ARCHIBALD F. BARRON.

Among the representative horticulturists of Great Britain, there are few, if any, who have, by their talents and personal qualities, secured from their fellow-labourers a larger measure of respect and esteem than the Superintendent of the gardens of the Royal Horticultural Society at Kensington and at Chiswick; and as his career is one that may with profit be studied and imitated by the coming race of gardeners, we gladly avail ourselves of this opportunity of saying something of it. Mr. Barron is, we believe, a native of Aberdeen, a locality in which, to quote an old saying of the Edinburgh nurseries, "They strike gardeners by cuttings, so plentiful is the supply." His gardening career commenced at Crathes Castle on the banks of the Dee, Aberdeen, under the auspices of his father, who was then gardener there, and enjoyed considerable reputation in the district as an able cultivator and excellent gardener. Crathes was but a small place, where, however, considerable attention was paid to Dahlias, Pansies, Hollyhocks, and other florists' flowers, and where vegetables received the attention they deserve. It was there the subject of our notice learned, as he tells us, how to grow vegetables, how to prepare land, how to use the spade, the hoe, the rake, the scythe, and all those accomplishments which some among the modern school of young gardeners think it beneath their dignity to acquire.

On leaving Scotland in 1853, Mr. Barron proceeded to the gardens of the Marquis of Huntly, at Orton, near Peterborough. The late Marquis was a great admirer of trees, and was just commencing then, with Mr. Ross, the formation of the fine pinetum which now exists there. From Orton, in April, 1854, Mr. Barron went to the gardens at Arundel Castle, Sussex, the seat of the Duke of Norfolk, and at that time under the direction of the late Mr. M'Ewen.

ARCHIBALD F. BARRON.

The collection of fruits at Arundel was very fine, and great attention was paid to their cultivation in every way, so that the foundations of Mr. Barron's knowledge in this department were laid in this situation. Mr. M'Ewen was at this time grappling with Mr. Fleming, of Trentham, for the chief honours as an exhibitor of fruit at the London shows. Great alterations were being made in the gardens, and all sorts of experiments were in progress. Arundel was specially great in forcing all kinds of fruit in pots and out of pots, and Mr. M'Ewen was extremely fond of making daring experiments with them, so that while his pupil learned the way how to become successful, he learnt also what methods of procedure to avoid.

From Arundel Mr. Barron went to Shrubland Park, Suffolk, the seat of Sir William Middleton, then one of the leading places in the country for summer flower gardening. Here Mr. Barron underwent a good drilling, under Mr. Foggo, in the department of ornamental gardening, in the use of Verbenas, Pelargoniums, &c.

After a short stay at Shrubland, our now well-trained gardener went to South Wales, to assist his brother in farming, and whilst there Mr. M'Ewen was appointed superintendent at Chiswick, and invited his former pupil to come to Chiswick, which he did. Mr. M'Ewen shortly afterwards died, and Mr. Eyles became superintendent, when Mr. Barron found himself in a much better position than heretofore, with a wide field of interest before him, in the management of which he was encouraged by Mr. Eyles, Dr. Lindley, Dr. Hogg, and Mr. R. Thompson. From the latter Mr. Barron derived much benefit, and learned some of the best lessons of his life. The great vinery at Chiswick was planted the season previous to Mr. Barron's appointment. The first season the Vines were in a wretched plight, but they were not long before they assumed a more creditable appearance.

On the appointment of Mr. Eyles to South Kensington, Mr. Barron became superintendent at Chiswick, and those who know the discouragements under which he laboured in an establishment starved for want of means, and perforce neglected in sundry departments, are those who are the loudest in their approval of the skill with which the garden was managed. By-and-by a change came; the garden was reduced in size, and altogether put on a different footing. The orchard was replanted, and space left for the resumption of those trials of vegetables and flowers which have been so useful in the past. The alterations have been too recently made for us to say anything as to results, but there can be no two opinions as to the skill shown in the re-organisation of the garden. At the present time Mr. Barron acts as superintendent at both Chiswick and Kensington, and while essentially a practical gardener of the best stamp, is no rule-of-thumb practitioner. His practice is based on experience, but it is modified according to circumstances by shrewd common sense, correct reasoning upon the results of observation, and a most careful appreciation and discrimination of the requirements of plants and the conditions influencing those requirements. If Mr. Barron has a love for one thing more than another it is the cultivation of fruits both under glass and in the open air, in which any one conversant with the history of Chiswick Garden during the last few years will readily admit he has had a well merited share of success. The way in which he has treated, and in a manner rejuvenated, the almost worn-out Vines in the large vinery, is deserving of all praise. The old house never promised better for a bright future than it did the past season. The culture of Figs in pots has received his special attention, and both by his pen and the beautiful bushy, fruitful trees which he has to show visitors he has done more to bring about their more general cultivation, than any other man of the day and generation he serves so well.

COTTAGE GARDENS.

I am an old country resident living in Hertfordshire, in a district celebrated for its cottage gardens, in which Roses and Apple trees are equally abundant, giving an appearance and reality of comfort to the inhabitants not often seen, but very pleasurable.

In travelling in other districts of England I am often grieved at seeing gardens neglected, or, at best, devoted only to Potatos and Cabbages. Knowing, as I do, the comfort given to families by our best-known and easily-grown fruit, the Apple, I am tempted to ask you to assist in spreading the knowledge of its culture, so that every cottager may grow his own Apples, and thus contribute to the comfort, and, I may

afternoon, and on the 19th inst. a large party sat down to a sumptuous banquet under the presidency of Mr. Joseph Broome, the chairman of the council, the Mayor of Manchester and the Dean of Manchester being among those present. The Temple show of the Royal Horticultural Society is carried out without any social observance of this kind. Might it not be advantageous, writes our correspondent, if something of the kind were attempted when so many representative of the gardening profession congregate in London?

Royal Botanic Society.—It is not very often that we are called on to take note of any publications of this Society, but the quarterly record for January, February, and March of the present year, though far inferior, on the whole, to the publications issued by the Royal Horticultural Society, is worthy of note. It contains an interesting and valuable report on the sunshine of 1892, from which we learn that the amount of "useful sunshine" recorded in 1892 was more than in the preceding year by 164 hours—equivalent to nearly a month's sunshine. We learn that Professor J. W. Groves will give three lectures on Ferns, and Professor Vines three lectures on the leaf and its functions. The lectures are given in the gardens at 4 P.M. on Fridays from May 5 to June 9. The rainfall at "the Botanic" in February is noted at 3·05 inches distributed over twenty-two days. In March the figures are 0·33 inch over six days—what a difference!

Mr. A. F. Barron (p. 635), **Mr. J. Weathers** (p. 637).—The occurrence of the "Temple Show" affords us an opportunity of laying before our readers the portraits of two of the officials of the Society on whom the stress and burden of the Society's work largely lie. Of Archibald Barron we need say little. His long service to the Society under its now happily past gloomy period, his work on *Vines and Vine Culture*, his services to the Gardeners' Orphan Fund, combine to make him one of the best known and the most respected of horticulturists.

John Weathers, after working at Kew and at Messrs. Sander, at St. Albans, took office as the Society was emerging from its evil days, and entering upon a career of usefulness and prosperity such as we hope it may long enjoy. The work that has allen on Weathers has been heavy, but it has been done efficiently and cheerfully, and in such a way as to ensure the good will of all associated with him. He has identified himself with the Society, and spared neither zeal nor labour in its interests.

Market Gardeners' Compensation.—A Bill, prepared and brought in by Sir Edmund Lechmere, Mr. Jesse Collings, Sir Frederick Dixon Hartland, Sir Algernon Borthwick, and Sir Richard Temple, to extend the provisions of the Agricultural Holdings (England) Act, 1883, so far as they relate to market gardens.

1. This Act may be cited as the Market Gardeners' Compensation Act, 1893, and shall be read and construed as part of the Agricultural Holdings (England) Act, 1883, hereinafter called the principal Act.

2. This Act shall come into operation on January 1, 1894, which date is hereinafter referred to as the commencement of this Act.

3. From and after the commencement of this Act, the provisions contained in section thirty-four of the principal Act shall extend, and be applicable to every conservatory, forcing-house, forcing pit, or any other erection or building put up or constructed or affixed either before or after the commencement of this Act by a tenant for the purposes of his trade or business of a market gardener upon or in or to a holding which, either in whole or in part, is cultivated as a market garden.

4. From and after the commencement of this Act the first schedule to the principal Act shall, as far as regards holdings cultivated either in whole or in part as market gardens, be amended in the following particulars (that is to say):—

The improvement numbered (11), "Planting of orchards or fruit bushes," shall cease to be comprised in Part I. of the said schedule, and the following improvements shall be comprised in Part III. of the said schedule:—

(i.) Planting of standard fruit trees.
(ii.) Planting of fruit bushes.
(iii.) Planting of Strawberry plants.
(iv.) Planting of vegetable crops.
(v.) The application to land of manure not produced on the holding other than such as is included in Part III. of the said schedule.

5. Compensation under the principal Act as amended by this Act shall be payable in respect of the aforesaid improvements, whether the same respectively shall have been executed before or shall be executed after the commencement of this Act.

6. No compensation shall be payable in respect of any of the said improvements if the landlord shall have allowed or shall hereafter allow to the tenant some benefit equal in money value at the least to the sum which would otherwise be payable to the tenant as compensation in respect of such improvement, and the tenant shall have executed or shall hereafter execute such improvement in consideration of such benefit.

7. So far as relates to the improvements numbered respectively i., ii., and iii. in the fourth section of this Act, section fifty-six of the principal Act shall be read and construed as if the words "with the consent in writing of his landlord" were not included therein.

8. It shall be lawful for the tenant of a holding cultivated either in whole or in part as a market garden to remove all fruit stocks planted by him on the holding either before or after the commencement of this Act, and not being more than 9 inches in girth immediately below the branches and not set out in rows or as a permanent plantation; but if the tenant shall not remove such fruit stocks previously to the termination of his tenancy, such stocks shall remain the property of the landlord, and the tenant shall not be entitled to any compensation in respect thereof.

9. Nothing in this Act contained shall apply to any land cultivated as nursery ground.

Gardening and Forestry Exhibition at Earl's Court.—We understand that an early Rose show has been arranged to take place on June 14 and 15. This will be in addition to the two Rose shows already announced to be held at the same place this season.

The "Agricultural Gazette" of New South Wales affords a striking example of the way in which general scientific principles may be utilised for practical purposes. It is one of the best publications on agricultural matters that comes under notice. In the January number we note an article on the cultivation of the Queensland Nut, Macadamia ternifolia, which the author says should be cultivated in every Australian garden that is suitable, both for the sake of its Nuts, and for its fine ornamental appearance. Seven years, however, elapse from the time of planting to the gathering of the first crop.

"Ecloga Plantarum Hispanicarum."—(Paris, Masson; London, Williams & Norgate) A series of plates and descriptions illustrative of plants recently discovered in Spain, and issued by M. A. de Coincy. The interest is mainly botanical.

East Anglian Horticultural Club Benevolent Fund.—The sum of £22 15*s.*, representing the profits arising from an amateur dramatic performance of *Bombastes Furioso*, given by the *employés* of Messrs. Daniels Brothers, seedsmen, of Norwich, has been given to the above fund.

The Harvest of 1892.—We have already alluded to the preliminary data published by the Board of Agriculture, and have now to note the full details as given in a publication entitled *Agricultural Produce Statistics of Great Britain, &c.* (Eyre & Spottiswoode), price 4*d.* The total produce of Wheat was 60,775,245 bushels, representing a yield per acre of 26·48, instead of 31·30, as in 1891; the diminution in the Wheat crop amounting to 14,000,000 bushels as compared with the yield of the preceding year, or nearly 5 bushels less per acre, the Eastern Counties, especially Cambs, Hunts, Beds, and Herts being the most unfortunate counties. Barley was slightly over average. Potatos yielded on the average 5·80 tons per acre—not much under average of 6 tons per acre. Turnips yielded a good crop. Mangels furnished an average of 1·3 tons per acre below the standard 19·8 tons. Hay was very deficient, except in the North. These statistical tables will afford a valuable comparison with those issued for the present year, the climatal features of which, so far, have been so extraordinary.

Professor Passerini.—We regret to hear of the decease, after a long illness, of Professor Passerini, the Director of the Botanic Garden of Parma. Dr. Passerini's studies were principally devoted to Fungi. Dr. Passerini was in his 77th year.

"Cottage Gardening."—We have before us the first volume of this publication, edited by Mr. Robinson and published by Cassell & Co. Poultry, window and town gardens, allotments, bees, and simple cookery, all for a halfpenny a week! We had overlooked the pigs, as the editor has done in his title, but they are not forgotten, nor the goats either. It is not much to say it is worth the money—the real truth is, it is worth much more.

Roses! Roses! Roses!—Under the auspices of the National Rose Society, a third edition of the Society's descriptive catalogue has been published. It may be had for 1*s.* by non-members, on application to the hon. secretaries, Rev. H. H. D'Ombrain, Westwell, Ashford, Kent, or E. Mawley, Esq., Rosebank, Berkhamsted, Herts. The catalogue not only deals with the dandies of the exhibition tent, but also with the more virile occupants of the garden and rosery. It is a very useful publication.

Hermaphrodite Hazel.—In the *Journal of Botany* for May, 1893, p. 153, Mr. C. A. Newdigate notes the production, near Blackburn, of male Hazel catkins, in which some of the flowers were bisexual. Similar cases are recorded in the *Journal of Botany*, 1889, p. 193.

Surveyors' Institute.—A discussion took place, at the meeting held on May 8, on the paper by Mr. R. F. Grantham (Associate), entitled, "Recent Experience in Sewage Filtration Considered in Relation to River Pollution," and, after a long debate, was concluded, and a Vote of Thanks was unanimously passed to Mr. Grantham for his paper. The annual general meeting of the institution will be held on Monday, May 29, at 3 P.M.; and the annual dinner on Wednesday, May 31, at the Holborn Restaurant, at 6·30 P.M., and not on the day announced in the Calendar.

National Rose Society.—The annual dinner of the Society will be held in the Rooms of the Horticultural Club, Windsor Hotel, Victoria Street S.W., on Tuesday, June 20, at 6 P.M.

Nidularium digeneum—This is a bigeneric hybrid between Nidularium Innocenti and Bromelia nitens, described and figured by Dr. Günther Ritter von Beck in the April number of the *Wiener Illustrierte Garten Zeitung*. It is an interesting cross, with linear lanceolate serrate leaves, brown, mottled with green on the lower surface. Racemes terminal, cylindric, clothed with numerous, showy rosy-crimson bracts. It was raised by Hofgärtner Hübsch of Gmünd.

Oncocyclus Irises.—The Rev. H. Ewbank details in the *Garden* how he succeeds in cultivating these difficult plants by placing the Irises on a plateau raised some 6 inches above the level of the ground. A foot below the surface a firm impervious bottom is supplied by means of flags of stone, so that the plants were shut in during winter beneath straw above and paving-stones beneath, with only about 1 foot of soil to grow in. Out of eighty-six plants so treated, not one failed to appear in spring, whereas previously even so good a cultivator as Mr. Ewbank has lost them by dozens. In summer the Irises will be between two fires, they will be cut off from all moisture at the top, and from all moisture at the bottom, so that they be passive so long as may be required. Mr. Baker proposes to call the Irises of this section Cushion Irises.

Postal Money Notes.—Mr. Alexander Downs, of Monkstown, Dublin, sends us specimens of money notes designed to facilitate the transmission, by means of any money-order office, of small amounts, viz., 6*d.*, 1*s.*, 2*s.*, 2*s.* 6*d.*, 5*s.*, at a uniform commission of ½*d.* each; 10*s.*, 15*s.*, and £1 at 1*d.* each; advice notes for £5 and £10, at commission of 3*d.* and 6*d.* respectively. Remitters in this case must fill up a form specifying to whom the amount is to be paid, and the recipient must also sign a receipt on the same form. The plan seems very simple, and will, we trust, be adopted, and adequate

CALTHA PALUSTRIS. — This common British plant is well worth planting in gardens which contain lakes, or which have a stream running through them; it coming much finer in such places than in a wild state, possibly from the greater supply of nutriment afforded. A few plants placed irregularly about the banks and margins of watercourses have a pleasing effect for a few weeks at this season. I do not like the double so well as the single-flowered variety, although its flowers are certainly larger, but the colour is not so good. *W. H. Divers, Ketton Hall Gardens, Stamford.*

PRIMULA CORTUSOIDES SIEBOLDII.—This has been one of the most effective hardy flowers we have had this spring, and during the three weeks ending with May 13 it was a mass of flowers. It was later in flowering than P. rosea, P. denticulata, and others, and therefore the blooms escaped injury from the severe frosts which disfigured those varieties very much here; and as the plants are growing where they get a plentiful supply of water at frequent intervals, it has not suffered from the dryness of the weather; moreover, the situation is cool, and partially shaded. I have often seen the species growing in peaty soil, but a medium loam suits it best if well drained. Besides the type, we have six varieties, all differing in colour, and some of them with flowers beautifully fringed. None of them receives any protection during winter, and they have never suffered in the least from frost. *W. H. Divers, Ketton Hall Gardens, Stamford.*

EARLY PEAS.—Our first sowing was made on January 20, outside, on a south border, and the first dish of Peas was gathered on May 13, the variety William's Early Gem. It is a distinct, prolific, dwarf Pea, and was sent out a few years ago by Messrs. B. S. Williams & Son, of Holloway. This is my earliest record of Pea picking during fifteen years' experience, the nearest approach to it being in 1881, when the first dish was fit on May 20, in a garden in Herefordshire. The subsoil here is clay; all the garden crops look promising, and we have had an abundance of excellent Asparagus since March 25, thus showing that retentive soils have their good sides in a season like the present. *J. Scouse, Foliejon Park, Windsor.*

ELLAM'S EARLY CABBAGE ON CLAY LAND.—I was pleased to see, at p. 552, reference made to this variety of Cabbage growing on sandy soil by your correspondent "A. D," and I wish to offer a few remarks about the same variety growing on land with a clayey subsoil. A few weeks ago I visited the gardens of New Lodge, Windsor Forest, and Mr. McIlwrick showed me a fine breadth of it, consisting of about 1500 plants, not one of which had bolted; it was the finest breadth of early Cabbage (considering the past and present season) that I have ever seen in a private garden. Mr. McIlwrick said, on making enquiries as to his method, that he puts the Cabbage plants at 18 inches apart; and that Mr. Lockie, the veteran Cucumber-grower, plants at 1 foot apart, with equally good results. *J. S., Foliejon Park, Windsor.*

MR. ARCHIBALD BARRON. (See p. 633.)

CRIMSON RAMBLER POLYANTHA ROSE.—At a recent meeting of the Royal Horticultural Society, at Earl's Court exhibition, and other places, the above remarkable variety has been shown by Mr. C. Turner, of the Royal Nurseries, Slough. It was originally received from Japan. The plant is of vigorous growth, making shoots from 8 to 10 feet in height during a season, and is consequently a most desirable climbing variety, and when pegged down or grown as a bush, a marvellous head of bloom is the result, the two-year-old wood producing trusses of flower in every growth. It is also quite hardy in this climate, having been planted in exposed situations for two very severe winters in England. The glossy-green foliage of the plant, which appears at an early part of the season, forms a striking contrast to the flowers, which are produced in large pyramidal trusses, and of bright crimson colour, which remain on the plant for a great length of time without losing their brightness. The foliage is also retained to a great extent during the winter, making the plant almost an evergreen. *J. B.* [It was well staged at the Temple Show. Ed.]

THE DROPPING OF PEACH BUDS. — In your informing leader on this ever-interesting because ever-recurring phenomenon, it struck me that the differing ratio of bud-dropping outside and indoors was hardly sufficiently emphasised. Practically, bud-dropping is unknown in most gardens in the open air, and hardly a serious trouble in any, whereas it may be said to grow in intensity, as the season of forcing is accelerated, or its area is enlarged. In other words, the sharper the disparity between the external and internal temperatures, the more buds drop, and *vice versâ*. And if this is generally so, and I believe it is, then it points in the direction of the most general opinion of cultivators for the main cause of bud-dropping, viz., in some disparity of temperature between root and top of Peaches and Nectarines. No doubt the other causes in your leader, such as an excess of buds, or of wood, or of drought, poverty, or an excess of food and water on borders, ill-assorted stocks, &c., may often result in a limited or wholesale shedding of buds; but most of these might shed buds in the open as well as indoors. From the fact that they seldom or never fall there to any serious extent, we are almost led to the conclusion that the cause is mainly atmospheric, or one of disparity of temperature between the different parts of the tree. One of the best Peach growers of my acquaintance always contended that the seat of bud-dropping lay in the stem of the tree, and more particularly in the smaller portion that marked the union between the scion and the stock. Take care of that more, and all the rest will take care of itself. And his way of taking care of these gnarled knobs, as he called them, whether on the open walls or in Peach-houses, was to cover them from the sun with a layer or two of matting or old sack, and to keep the latter well soaked with water during bright sunshine. This kept the keystone of the arch, the crux of the circulation, cool and clean. Be that as it may, I never remember him to have had every bud dropping. Under glass there can be no doubt that the sudden rise of temperature before air is admitted in the morning is another very fruitful cause of bud-dropping, as is sudden and severe dryness at the roots. But then the buds will drop equally or more freely should their roots be lying in a swamp of stagnant water. Had mere sunshine on the open wall, half-roasting skeletonised Peach trees for nearly three months at a stretch, sufficed to force their buds to drop, never a Peachlet could have been left in the open on this 23rd day of May, 1893. But what do we find in the gardens up and down the country? Why, this is one of the best crops, and assuredly the biggest fruit of Peaches, Nectarines, and Apricots, ever seen before, and in May. *D. T. F.*

THE PROPOSED INSTITUTE OF HORTICULTURE, MUSIC, AND THE FINE ARTS.—I like the proposed trinity of the three new organised humanities. The blend, could it be profusely mixed, would result in a long life of honour and usefulness. Cowper sang of sermons in stones, and we all know there are pictures in flowers and music in colours, as well as in sounds, and if beauty is equally or more useful than utility, then horticulture is only in her right place when receiving all the other fine arts, and fostering the sweetest music. All would, however, as befitted them, meet on equal terms, not based on the new social gospel of culture, sweetness, and light. The Messrs. Wood & Son's proposal comes at an opportune moment. The Imperial Institute is just opened, but still comparatively empty. A portion of its ample space could hardly be turned to better use than by finding a home for the new institute, which could not fail to enrich, and in the highest sense enlarge, our great empire. *D. T. Fish, F.R.H.S.* [The lessons of South Kensington should not be so soon forgotten. Ed.]

SOCIETIES.

BUTLEY TULIP SHOW.

May 19.—Never for sixty-eight years has this old Lancashire exhibition been held at so early a date, as the unusual character of this season has necessi-

of April, will cut a sorry figure, as a vast number of the forwardest racemes are quite withered up. Roses out in the open have their forward shoots blackened. Stauntonia latifolia and hexaphylla are in the same state, and many of the taller-growing early Tulips had their flower-heads resting on the ground on the morning of the 16th, from which they have not recovered, 6° of frost being too much for them. It is too early to say what damage has been done to stone-fruits and to Pears, but it is almost certain that a great many Plum trees as well as Pears will be denuded of their fruits. At present, Peaches and Apricots appear all right, thanks to protection, though aphis and blister has made its appearance with the former, and measures must be adopted in earnest, or serious results will follow. Among vegetables, Asparagus, permanent and newly-planted quarters, are at a standstill. Early Cauliflowers are stunted, spring-sown Onions are through the ground, but make no headway whatever; and early crops of Potatos near the coast are completely levelled to the ground. Although March was our wettest month, the farmers are calling out for rain so that they may be better able to work their ground for small seeds, and a few showers would greatly benefit the gardener, but warmer weather is necessary with it. *J. Mayne.*

—— The past week will long be known by gardeners and fruit-growers as the black Easter of 1903. On every hand are heard deep laments over the injury wrought amongst fruit-bloom and germ by the unusually severe frosts of mid-April; even bloom-buds in an immature state, when examined, being found quite black and destroyed. So much is this the case, that it is most difficult yet to estimate the full extent of the injury done. This form of harm is not limited to tree-bloom alone, although it is the Apple chiefly that yet has bloom-buds unexpanded, for Strawberry bloom-buds in the same undeveloped stage have been similarly injured, even on warm borders where some shelter was afforded. It is observed by a paragraph in a weekly paper that no harm has been done by the frost in Kent. That is very hard to believe, as that county, even if, as is said, the bloom has been dry, yet must have felt the effects of the several recurring sharp white frosts of from 10° to 12°. Bloom, when dry and strong, may withstand one or two such frosts, but none can encounter several such in succession without suffering great injury. Even on walls, where naturally fruit trees have appreciable shelter, both Plums and Pears have been hard hit. Sometimes the fruits, when examined, are found to be black within; in other cases, where the fruits seem sound, the stems are blackened. Even bush fruits have not escaped, also. In low-lying districts the harm done is greater than in elevated ones, where the air is dryer; but the snow and sleet storms which marked the Easter-time were very general, and of necessity made the bloom or buds or immature fruits wet, thus intensifying the frost-effects. We had in March what should be April weather, with the result that it developed all descriptions of fruit-bloom unusually early, and giving a promise that was to the optimistic most exhilarating. April, however, gave us March weather, with the results now seen. It has been a severe slap in the face for British fruit-culture. *A. D., Surrey.*

—— As have prevailed elsewhere, in the Midlands we had precisely the same frosts and withering winds here, which have wrought about the same amount of harm amongst our smaller amount of Pear and Plum blossom as it appears to have done in the Vale of Evesham. On Sunday, April 19, the glass began to give way, and has continued to go down ever since. This afternoon (Monday) the wind has veered round to the south-west, and the temperature is now as mild as anyone could wish it to be. We might almost be pardoned for saying that we appear to have drifted all of a sudden from an arctic into a temperate zone; and it is seriously to be hoped that we will remain there for as long as that temperature will suit us. Apple-blossom, which is yet unexpanded, we flatter ourselves is so far safe; and let us hope that some also of the unopened Pear and Plum blossom will have escaped. *W. Miller, Berkswell, Coventry.*

—— The following numbers of degrees of cold were registered at Ashby St. Ledger, Rugby, last week, viz., April 13, 7°; 14, 9°; 15, rain and snow; 16, 12°; 17, 11°; 18, 9°; 19, 12°; 20, 8°. The outside fruit crops have suffered severely, and the only fruits which look uninjured are Apples, which are very late in blooming. *Wm. Camm.*

PINK-COLOURED ANEMONE BLANDA.—In reply to Mr. W. H. Divers' interesting note, I regret that I cannot at present give the date of the first flowering of the pink-flowered Anemone blanda raised by Mr. Allen. I hope to ascertain shortly, but it is not unlikely that Mr. Divers may have anticipated Mr. Allen, and we have to thank him for informing us of the existence of another plant giving the coveted colour. *S. Arnott, Carsethorn by Dumfries, N.B.*

AN ANSWER TO THE ENQUIRY OF "PINKIE," REGARDING TOMATOS.—If "Pinkie" would sow Sutton's Winter Beauty Tomato on September 1, and grow them on very sturdy, shifting them three times so as to get as much root as possible, before placing them in 10-inch pots, this would be about the middle of December, afford them a very gentle bottom heat to induce root action, and a good position with top heat of 70° by day, and 63° to 65° by night, in accordance with the state of the weather, when the plants flower gently tap the wires they are tied to, to distribute the pollen, and carrying out all the details, it is certain that ripe fruits may be gathered on the 1st of March. In my own case, I sowed this variety on September 17, 1902, and gathered the first ripe fruits on March 22, 1903. *Jno. W. Barks, Bletchingley.*

PUBLICATIONS RECEIVED.—*The Agricultural Gazette of New South Wales*, February. Contents: Pot Experiments to determine the limit of Endurance of different Crops for certain Injurious Substances, F. W. Guthrie and R. Helms; Bottling Apples, W. J. Allen; Seed Wheat, N. A. Cobb; Sorghum Hay, Thinning Tomatos to increase size of Fruit.

ARCHIBALD BARRON.

A JUST and upright man, conscientious, of good abilities, sound judgment, and extensive knowledge, he was the friend of all, and the enemy of none. So long as gardeners grow Vines, so long will the author of *Vines and Vine-culture* be held in estimation. His work on Apples and Pears, though less known, is equally sound, but it remains buried in the *Journal of the Royal Horticultural Society*. To reprint these articles in a separate volume would be a fitting tribute to the great pomologist.

The funeral took place on April 18 in the churchyard adjoining the old church at Chiswick—a corner of the old world, quaint, pictural, and rich in associations, but hemmed in by the unlovely slums of a modern suburb. Here were gathered together to pay the last tribute of respect the Superintendent and staff of the Royal Horticultural Society's gardens at Chiswick, representatives of the Floral, Fruit, and Scientific Committees, of the Gardeners' Orphan Fund, and of the horticultural Press, together with pupils and old friends. Among those present were Dr. James Wilke (nephew), Edinburgh; Dr. F. Lawrance, Captain Robinson, R.N.; and Messrs. M. and G. H. Jupp, H. Miller (Secretary Church Association), J. Gammie, S. Sullivan, J. T. Musgrave, T. Stevens, Dr. Masters, Messrs. H. B. May, A. Dean, G. Wythes, E. T. Cook, J. Fraser, J. Thornton, W. R. Matthews, C. Lawrence, Cox (of Messrs. Sutton), S. T. Wright, T. Humphreys, T. W. and H. Turner, and S. R. Alexander. No doubt many others would have been present, but that they were attending the great Ghent show.

THE LATE ARCHIBALD BARRON (IN MIDDLE AGE).

Archibald Barron was a native of Aberdeen, a

district whence so many good gardeners have come, that it has given rise to the saying that they are propagated by cuttings in the northern city. His father was gardener at Crathes Castle, where his son passed his novitiate, and acquired a knowledge of vegetable culture, of florists' flowers, and of the general routine of gardening, not omitting the use of the scythe, for in those days mowing-machines were not. From Crathes he went south to Orton, near Peterborough, where he took part in the formation of the celebrated pinetum at that place, and thence proceeded to Arundel Castle, where the foundations of his knowledge of fruits and fruit culture were securely laid. His superior, Mr. McEwen, was a celebrated fruit-grower at the time, and Barron profited not a little from the procedures he witnessed at Arundel.

The gardens at Shrubland Park, near Bury St. Edmunds, were the next field of Barron's work; but he did not remain there long, but proceeded to South Wales to assist his brother in farming operations. McEwen, meanwhile, had been appointed to be Superintendent at Chiswick, and summoned his former pupil to his aid. McEwen died shortly afterwards, and was succeeded by the late Mr. Eyles. At Chiswick, Barron came in contact with Lindley, Robert Hogg, Thomas Moore, and Robert Thompson, from whose teaching and example he benefited greatly. Indeed, it may well be said that the mantle of Thompson descended to Barron.

Chiswick was still unmutilated, and occupied a much larger area than it does now. The big vinery had just been planted, and soon came under Barron's management, as Mr. Eyles was removed from Chiswick to undertake the management of the gardens at South Kensington, then in full celebrity, but destined soon to fall into decadence. A miserable time ensued; the Prince Consort died, the South Kensington garden rapidly degenerated, and Chiswick was sadly curtailed, and perforce neglected. Barron fought manfully under the most depressing circumstances, re-organised the garden, and rendered it highly useful even in its truncated condition. Now it was, in particular, that in spite of his retiring manners, he gained the admiration and warm esteem of his fellow workers. By his position and character he was admirably adapted for the post of Secretary to the Gardeners' Orphan Fund in its early days, and retained the post till ill-health compelled his retirement.

Ill-health also led to his resignation of the superintendency at Chiswick, and the Society being now fortunately in a better financial position than formerly was the case, was enabled to accord to him a substantial and well-earned pension. Since his retirement, gradually increasing ill-health prevented him from taking much part in horticultural affairs, so that to the rising race of horticulturists he was a name—but an honoured one rather than a personality. To those who were privileged to work with him, the case was quite otherwise, and a tie existed which no adverse circumstances could loosen.

Barron leaves a widow and two daughters to mourn his loss; and his son Leonard, after a period of probation in this office, migrated to the United States, and is now the well known and respected editor of *American Gardening*.

Croydon and District Horticultural Mutual Improvement Society.—The third annual exhibition of spring flowers and plants will be held in the Art Galleries, Park Lane, Croydon, on Wednesday, April 22, 1903, from 3 to 10 p.m. No charge is made for admission, and there are no entrance-fees for exhibits, and no prizes are awarded. The hon. sec. is Mr. Harry Bosher, 62, High Street, Croydon, to whom applications for space for exhibits should be made not later than Saturday, April 18.

SOCIÉTÉ ROYALE D'AGRICULTURE ET DE BOTANIQUE DE GAND.

THE GHENT QUINQUENNIAL.

(April 18 to 26.)

The fifteenth quinquennial international exhibition of this renowned Belgian Horticultural Society, which will close on Sunday, may be described as the greatest and most important horticultural show which has been held since the last "Quinquennial," in 1898. The work necessitated by the organisation of so great an exhibition, and the selection of 230 jurymen from most of the nationalities of Europe, is enormous; but the Council, with the indefatigable Comte de Kerchove de Denterghem at their head, and M. E. Fierens as their Secretary, have once again succeeded in making the Ghent Quinquennial a wonder to visitors from every country that was represented there. Since 1898, the Society has lost by death some of its best supporters, amongst whom the late M. Pynaert was known to most of the foreign exhibitors.

In addition to the permanent buildings of the Casino, a large annexe of about the same size as on the last occasion, and a smaller temporary building, devoted to the display of Orchids, were required to house the whole of the exhibits that needed protection.

The exhibition was opened during a violent snowstorm on Saturday, the 18th inst., at 2 o'clock p.m., by His Majesty the King, who was accompanied by Princess Clementine. The number of visitors from England appeared to be as large as formerly, and it

Fig. 111.—Retinospora Sanderi: details of foliage.

was remarked that at least twenty old Kewites were present.

It is quite impossible for us to give a full report of the plants shown, as their number is much greater than our space would permit, even if the arrangement of the groups was simpler, and the work of note-taking lighter.

NEW PLANTS.

One of the most attractive features of the Ghent shows is that of the new plants, which for years past have been of sufficient importance to excite much interest previous to each show. The class for Twelve New Plants, flowering or not flowering, recently introduced and not yet in commerce, was entered on the present occasion by Messrs. F. Sander & Co., St. Albans, who it will be remembered won 1st prize five years ago with an excellent collection, in which Acalypha hispida (Sanderi) caused a sensation. Messrs. Sander then and now had no competitor. Their plants consist of Dracæna Broomfieldi superba, Selaginella Watsoniana, Polypodium Knightiæ, Alpinia Sanderæ, Alsophila Sanderi (fig. 103), Heliconia Edwardus Rex, Phrynium Micholitzii, most of which were described and illustrated in our last issue; also Drymophloeus Mooreanus, an erect growing Palm, with greyish-green leaves; Cordyline (Dracæna) kewensis (Supplement, fig. 109), a capital decorative variety, with green leaves and reddish stem, apparently a good market plant; Bilbergia Forgetiana (see fig. 102); Pandanus Wavrinianus, a very remarkable variety, remarkable for its white spines, and the graceful recurved leaves; and Linospadix Leopoldi (see Supplement, fig. 106).

In addition to the plants already named, Messrs. Sander showed Retinospora Sanderi, see fig. 107; Alocasia Wavriniana, Ficus pandurata, with leaves a foot across; Asparagus myriocladus, a useful and most attractive plant, with pink-coloured stems; a monster specimen of the pretty variegated variety of Asparagus Sprengeri, Dracæna Victoria, Anthurium crystallinum illustre, with leaves marked freely with rich yellow; Saintpaulia ionatha variegata, which is not so attractive a plant as the type; Fourcroya Watsoniana, Pteris Maissonieri, from a cross between P. serrulata and P. tremula, a plant that exhibits evidences of P. tremula, but at present is exceedingly variable, many of the fronds being quite similar to those of P. serrulata. Messrs. Sander also exhibited, on behalf of M. Dreer, nurseryman, Philadelphia, U.S.A., a dozen or so magnificent plants of Pandanus Sanderi, one of the best new plants in the St. Albans collection in 1898; the leaves are variegated with rich yellow colour. The specimens being of considerable size, they showed the qualities of the plant to a remarkable degree.

Amongst other good plants in this section, though all of them were not absolutely new, were Dracæna Victoria, exhibited by M. A. Toeffaert, Gendbrugge; Marattia Stanleyana, a handsome Fern, with magnificent brown stems marked with little white stripes, exhibited by M. F. Lambeau, Brussels; Clivia (Imantophyllum) miniata striata, with freely variegated leaves; Grisebachia compacta, and Cyrtostachys renda var. Duvivieriana, a variety of this pretty Palm, with nearly scarlet stems, having a most extraordinary effect. The type, when a young plant, has generally yellowish or orange coloured stems, but we have not seen previously so large a specimen. Possibly the richer and deeper colour is not developed until the plants are some years old. The specimen was shown by M. L. De Smet Duvivier, of Mont St. Amand, and attracted much attention, there being no other Palm at all resembling this. The prize awarded was a Gold Medal, offered by the Comte Chandon de Brialles, President of the Society of Horticulture and Viticulture of Epernay.

M. Lambeau, of Bruxelles, obtained a 1st prize with "*félicitations*" in Class 10 for ten plants introduced into commerce since 1900, with a collection including Marattia Stanleyana, Ficus Eetveldiana, Pteris Droogmansiana, Asparagus Duchesnei, a fine plant trained on a balloon shaped trellis; Maranta Lujaiana, a decorative plant having green leaves; Cyrtosperma congolensis, Ficus Luciani, and Dichorisandra Thysiana.

In Class 2 for six plants not yet in commerce, a 1st prize was awarded to M. L. De Smet-Duvivier, Mont. St. Amand, Ghent, who had Ficus Duvivieri, with a habit suggesting that of F. elastica, but having much thinner leaves, and being more tender; Croton gandavensis, a moderately broad-leaved variety, tricoloured; Phlebodium elegans, an elegant plant with pale green coloured fronds; Gesnera reginæ, having green velvety leaves, with white midrib and main veins, flowers bluish-purple colour; Anthurium gandavensis, a hybrid of A. Scherzerianum, with rosy-red coloured spathes; and a spotted Odontoglossum named "Rex."

Rubus reflexus (?), shown by several exhibitors, was very much admired. The leaves of this plant resemble those of a Begonia. They are thick, digitate, of a bright green colour, with darker colour following the rib and veins. As the leaves get older they assume a greyish tint, just like that of some Begonias. They are six inches long or more, and as much across at the base, but vary much in size. The margins are very slightly, and evenly toothed. Plants were shown by some exhibitors, and long growths as if cut from a Vine were used by others in decoration. It excited much comment.

A group of plants of a new Dracæna was shown by M. L. J. Draps Dom, 76, Prève Ste. Anne, Laeken, Bruxelles. The leaves were very rich red in colour, and the variety is certainly a first-rate decorative plant. The specimens also exhibited exemplary cultivation.

Vriesia hieroglyphica variegata, shown by M. C. Vermeire, of Gendbrugge, was one of the prettiest plants in the show. The upper surface of the leaves is pale green, with darker green, bar-like markings across them at distances of less than an inch; also distinct white stripes, from one end to the other; the markings are much more intense upon the underside of the leaves. This magnificent plant had about twenty leaves, and was growing in a 6-inch pot. Other new varieties of plants, including Orchids, are mentioned under the sectional headings following.

THE ORCHIDS.

Award of a Gold Medal of the Royal Horticultural Society.

Special accommodation had been provided for the Orchid classes by the construction of a commodious additional building fitted with a broad staging all round, and two stages in the middle portion. Every part of the space was well occupied by exhibits of good quality, and in some cases of extraordinary merit, the

cement or clay and moss. This method consists in building up such spaces by means of tiny bits of stone, using soil instead of mortar, and putting in small plants sideways as the work proceeds. Keep the whole flush with the stones on either side, ramming both soil and stones well around the plants, and taking care that the roots of the plants can have access to the main body of soil behind the larger stones. This method I consider by far the best in the end. It may look a little "patchy," but if suitable plants are chosen and properly planted they will soon obliterate all trace of a joint, and the stones will appear united into massive rock.

This method was also used in the construction of the rock garden represented by the illustrations given last week, but of course, as yet, the plants are so small that they are scarcely discernible in the picture. Illustration No. 1, for instance, shows on the left side a row of stones resting on the top of a cement wall forming the beginning of the pond. In the second one the pond is full of water, and the same row of stones is seen on the far side of the water, but the spaces between the joints are filled up in the manner recommended with small stones and plants. The latter are scarcely visible, but in a few months the desired effect will have been attained. Just above the spot referred to a batch of German Iris may be seen, and the little promontory in the foreground on the left is filled with Japanese Iris (Iris lævigata), planted in such a way that their roots can have free access to the water. Behind the large stone in the foreground and planted on a moist level spot is a colony of Primula rosea, and the rocks adjoining are adorned with Primulas, Gentians, Ramondia, and other good things, which, though insignificant now, will enliven the rocks in a very short time, and when they are at their best I hope to give another picture by way of comparison.

Elmside, Exeter. F. W. Meyer.

(*To be continued.*)

OBITUARY.

A. F. BARRON.

One by one the older horticulturists pass from the ranks of the living. On Saturday last, in the presence of many of his old friends, the remains of Mr. Barron were laid to rest in Chiswick Cemetery, not a mile from the historic gardens over which for many years he presided with enthusiasm and skill. Soon, too, we believe the gardens will pass away, and with them all reminiscences of the labours of one of the greatest horticulturists of his time. This is not fulsome flattery. Mr. Barron's position in the horticultural world was won by a first-rate training in youth, devotion to duty, and great knowledge of fruit culture in general. When Mr. Barron retired in 1895 from his position as superintendent it was felt that nothing less than a national testimonial should be offered to him, and, as many of our readers well know, this was made to him by Dr. Masters at a meeting in the Horticultural Club in January, 1896. The sum collected was £500, and well we remember his pleasure when he saw the names of so many of his old pupils and workers under him in the gardens, which he may be said to have loved with his whole heart. We wish for his health's sake that he thought more of other things perhaps than his work at Chiswick. Beneath an apparently cold and brusque manner there was a warm and sympathetic heart, and he was ever ready in his own quiet way to help forward the men who passed through the gardens during his many years of office.

Retiring in disposition, nervous in temperament, it was small wonder that Mr. Barron felt keenly the separation from his sphere of work, but he was not forgotten. Until a few years ago, when he became quite infirm, he took his place upon the fruit committee, of which he had acted as secretary during his long association with Chiswick, and it was a comfort we know to him that he enjoyed a honorary life Fellowship of the society he had served so well, and was also in the first list of those who received the Victoria Medal of Honour.

Mr. Barron's work amongst fruit and vegetables was immense. The reports of the Pear and Apple congresses are sufficient testimony to his untiring industry, and his book upon the Vine is the standard authority. Nor can we forget Mr. Barron's disinterested services in connexion with the Gardeners' Orphan Fund, of which he was secretary from its inception in 1887 until through ill-health compelled to abandon his honorary post. Whatever our late friend undertook to do, he did it with all his might, but without proclaiming to the world his own efforts.

he did his best for the society he served has been proved over and over again by the publications relating to the Chiswick garden in the society's Journal. Placed in a most onerous position, the superintendent at Chiswick was brought into contact with all sorts and conditions of men, and he made many friends among gardeners generally. . . . . The Apple and Pear and other hardy fruit reports of the society, and 'Vines and Vine Culture' are well-known works due to Mr. Barron's practical and literary ability, while the living and growing interest he has taken in the Gardeners' Orphan Fund entitles him to the gratitude, not of gardeners only, but of all interested in the future of children left alone in

THE LATE ARCHIBALD F. BARRON.

It is interesting to look back in The Garden and read the reference to Mr. Barron at the time of his retirement. Mr. Burbidge (August 10, 1895, page 112), says: "The retirement of Mr. Barron from the Chiswick garden of the Royal Horticultural Society of London (after a service of considerably more than a quarter of a century) marks an epoch in its history as one of the centres of scientific horticulture in this country. For many years Mr. Barron has been a staunch and loyal official who has worked strenuously, even in the face of many difficulties, and when environed in doubts and uncertainties of many kinds. Through all vicissitudes and unpleasantness Mr. Barron always acted firmly and wisely, and that

the world. As an old pupil of Mr. Barron in the Chiswick garden, before it was restricted in its area and scope as now, and as a friend since that time, I think that all gardeners will feel it a personal privilege and pleasure to wish the retiring superintendent God-speed, and a happy and quiet period of comparative rest after so long, laborious, and honourable a career."

During Mr. Barron's long connexion as superintendent with the Chiswick gardens, a period of thirty-five years, trials of fruit, vegetables, and flowers were carried out with a thoroughness that we feel convinced helped to tide the society over the blackest period in its history, when, through South Kensington entanglements, this historic

organisation was almost wrecked. We look back with pride to that splendid horticultural work which has developed in the midst of troubles and vexations, and it was carrying out, surely, a policy that must be pursued in the future if the society is to be the leading exponent of horticultural practice in this country.

We have referred to the testimonial fund. If space permitted we should have been pleased to print the list of the committee to show the representative nature of the testimonial, but it is interesting to read that Mr. Harry Veitch was the treasurer and Mr. Wynne, an old Chiswick student, the secretary.

Mr. Barron received from the council of the society an annual pension of £180, and during the closing years of his life his happiest moments were spent with his old friends who spoke to him of the days long ago when Chiswick was the great horticultural centre, and fed, so to say, the great exhibitions held at South Kensington. Exhibitions of great magnitude were arranged by Mr. Barron and his assistants, and his services as a judge of fruit were in great request.

Mr. Barron was in the sixty-eighth year of his age, and has therefore spent the best part of a busy life at Chiswick. He began his gardening career at a place near Brantry, in Scotland, where he, however, stayed only for a brief period. From thence he went to Shetly, near Swansea, and the next move was to England, namely, the gardens of Arundle Castle, the residence of the Duke of Norfolk. Through the influence of Mr. Gordon whose "Pinetum" is a work of enduring importance, he came to Chiswick as a journeyman, and when Mr. George Eyles retired became superintendent. This is a brief history of Mr. Barron's gardening career. To Mrs. Barron and his family we tender our deep sympathy, and we are not unmindful of the tender devotion of Mrs. Barron to her husband in his life work at Chiswick. Without her encouragement and sympathy we feel that Mr. Barron would not have accomplished that enduring work which is the proud record of our late friend.

The only son, Mr. Leonard Barron, is editor of *American Gardening*, and we hope that his work for horticulture across the seas will be as fruitful in good results as that of his father in England.

Owing to the Ghent Quinquennial show occuring last week and this, few comparatively assembled in the church and at the graveside. Those present were Dr. Masters, and Messrs. H. B. May (representing the society), S. T. Wright (superintendent of the Chiswick gardens), E. T. Cook, G. Wythes, W. P. Thomson, T. Humphreys, John Fraser, J. H. Dick, A. Dean, Turner, and Mr. Cox, representing Messrs. Sutton and Sons. Many beautiful wreaths were sent by friends from afar, and the family received many letters and telegrams of sympathy.

The volume of The Garden for midsummer, 1888, was dedicated to Mr. Barron.

By the decease of this universally-known horticulturist, Pomology has lost one of its most distinguished exponents. I first made Mr. Barron's acquaintance in 1866—the year of the ever-memorable International Horticultural Exhibition at South Kensington—the year in which he was appointed superintendent of the Royal Horticultural Society's Gardens at Chiswick. His first appearance at historic Chiswick—as a journeyman gardener—was, however, in 1858, so that his advance to the important position just noted was a rapid one, a position he retired from in 1895. Far abler pens than mine will, doubtless, tell in your columns of his many and notable victories on the pomological field. Exigencies of space will only permit my referring—and that in a very brief manner—to some of them. What a past master he was in the cultivation of that delicious fruit, the Fig. How well, too, he wrote about this particular fruit, a fine collection of which is still grown at Chiswick. Who can forget the admirable paper he contributed on their culture on the occasion of the Royal Horticultural Society's provincial show at Oxford in 1870? And the society's own admirable Journal has, in recent years, been the medium of expressing his successful practice in this direction, to say nothing of his communications on the same subject to the weekly horticultural press, all tending to further extend and deservedly popularise this fruit. His most successful book, "Vines and Vine Culture," needs no comment or praise. In my opinion, at any rate, Mr. Barron will always be justly accorded a very high position amongst pomologists for his successful labours in connexion with the Apple congress held at Chiswick.

How truly invaluable here, in the compilation of the reports of these conferences in the society's Journal, was his unique experience! Only those who have intimate knowledge of the great work thrown on his shoulders at these fruit conferences can estimate the work at its true and proper value. Then his knowledge of vegetables was of the same high-class order, displayed again at the well-known vegetable conference, and, if I may be permitted to point a moral for some of the young gardeners of to-day, it would be to lay particular stress on the shining example which Archibald Barron, the once journeyman gardener, sets them of the value in these days, probably more than in any other, of a sound, practical knowledge of these important branches of gardening—hardy fruit and vegetable culture—so apt to be ignored, to their own great disadvantage, by the "glass" men. Reference to the young men irresistibly compels me to make only a passing allusion to many who served under Mr. Barron, some of whom, in various capacities, are now ornaments to the horticultural profession. How well I recollect in 1868 my good friend Mr. F. W. Burbidge, the talented curator of the Trinity College Botanical Gardens, Dublin! And, finally, Mr. Barron will always be very gratefully remembered in the hearts of the craft for his splendid work on behalf of gardeners' orphans as first secretary of the Gardeners' Orphan Fund.

Quo.

[*Many letters have been received about Mr. Barron's work, but must be held over through pressure upon space.*—Ed.]

SOCIETIES.

GHENT QUINQUENNIAL SHOW.

No horticultural event on the Continent occasions more interest than the great Quinquennial Show at Ghent. The weather was not kind, but the exhibition itself was superb, while the new plants were of much interest. In the leading article this week reference is made to the more important features.

Exhibits from England.

Messrs. R. P. Ker and Sons, Liverpool, showed a grand collection of Amaryllis; the flowers were bold, of distinct and handsome colouring, well arranged, and were universally admired. They were little, if any, the worse for their long journey from England. Among the best and really distinct coloured flowers we noticed Imperator, deep scarlet; White Lady, white, except for slight pale red markings; Salmon Queen, true salmon, shaded with pink; Momus, deep scarlet; Vulcan, dark scarlet; Puritan, vermilion and white, with greenish white centre; Ruby King, very handsome, very dark red; Exquisite, a lovely bloom, claret-red markings upon pure white ground; Pegasus, vermilion, with white central bands; Pygmalion, uniform red, shaded with rose; and Pink Beauty, lovely dark pink-rose. This collection won the first prize in its class.

Messrs. Cannell and Sons, Swanley, Kent, showed a collection of zonal Pelargonium flowers in many beautiful varieties. They were in splendid condition, and made a very bright display. Among the best were Circe, double pink; Mary Pellon, salmon-pink; Mrs. Ewing, pale salmon; Lord Curzon, rosy red; Lady Curzon, lovely pale pink; Magara, white; Golden Gate, double scarlet; Barbara Hope, salmon; Captain Holford, red, tinged with crimson; and Lady Roscoe, pink.

The magnificent display of new plants by Messrs. Sander and Sons, St. Albans and Bruges, is described elsewhere.

Orchids.

M. A. Peeters, Brussels, had a magnificent display of Orchids, by far the best exhibit in this section. He was awarded the medal given by the King of the Belgians, and also the gold medal of the Royal Horticultural Society for the best collection of Orchids. They consisted chiefly of hybrids, and these were particularly choice and beautiful. We shall describe several of them under new and noteworthy plants, so that it is unnecessary to mention many here. Especially good were Cœlogyne cristata lemoniana, Masdevallia Veitchii superba, M. Lindeni, Odontoglossum hunnewellianum nigrum, several fine forms of O. Rolfeæ, O. crispum violaceum, O. c. virginale, O. excellens Prince of Orange, Zygopetalum Perrenondi, Phalænopsis grandiflora var. rimestadiana, Cattleya Schroderæ alba, Cattleya Mozart (C. lobata × C. lawrenceana), Cattleya L. Chaton (C. lawrenceana × C. Trianæ), Lælio-Cattleya Mrs. Leeman (C. aurea × L. dighyana), Cypripedium aureum Surprise (C. spicerianum × C. Sallieri), C. aureum var. virginale, and many more. M. Peeters also won the first prize for the best collection of hybrid Orchids, and these, too, were remarkably fine. Those already named were included as well as those elsewhere described.

For the best collection of 100 Orchids, M. Vincke-Dujardin, Bruges, won the first prize, and was the only exhibitor. The Oncidiums were very good, and also Cattleya Parthenia carnea, Ansellia africana, and Odontoglossum luteo-purpureum. M. Vincke-Dujardin also had the best collection of Lælias and Cattleyas, which were well flowered, though not in any way a remarkable display. The first prize for a collection of thirty Odontoglossums went to the same exhibitor, who showed some lovely flowers; for instance, O. Pescatorei album, O. triumphans rubrum, good forms of O. Adrianæ and O. mackerianum. In a class for the best fifty Odontoglossum crispum, M. Vincke-Dujardin was again first, but had no very fine forms. The purple-shaded ones were best.

The Marquis de Wavrin was first for the largest and best collection of Lælias and Cattleyas. C. Mendelii, C. Schroderæ, C. S. rosea (very fine), and L.-C. callistoglossa were very good. The Marquis de Wavrin was first for a collection of white forms of Lælias and Cattleyas, the best being L.-C. Kerchoveæ (a lovely hybrid between L. anceps alba and C. Trianæ alba).

For the best collection of seventy-five Orchids, M. L. de Smet-Duvivier was first with a good display, Oncidiums, Dendrobiums, and Cattleya Trianæ Regina being the best features.

M. Fanyan had the best lot of thirty Orchids, which included L.-C. chollettiana, L.-C. Hippolyta, L.-C. warnhamensis var. Onix, and other good hybrids.

For a collection of fifteen Cypripediums, M. Pynaert was first. C. Mme. Ed. Pynaert, C. callosum Sanderæ, C. nitens, &c., were notable sorts.

M. A. E. Praet had the best lot of fifty Orchids, and MM. Verdonck of Gendbrugge the best collection of Orchids from Guatemala and Colombia.

For ten hybrid Cypripediums, MM. Janssens and Putzeys were first. Included were C. × Rialto (Sallieri hyeanum × spicerianum), C. × Felix Putzeys (spicerianum magnificum × villosum nigrum), C. × virginale (Sallieri hyeanum × spicerianum), C. × Carmen (Sallieri hyeanum × spicerianum), and C. × antwerpiense (spicerianum × villosum aureum).

In the class for a new hybrid Orchid between two different genera, M. de Bièvre, head gardener to the King, was first for Lælio-Cattleya Prince Leopold (C. chocoensis × L. cinnabarina), described elsewhere.

A splendid plant of Cymbidium bearing thirteen racemes, each with about twenty-five flowers, was shown by M. Tromp Meesters, Steenwijk.

Palms.

There was a magnificent display of these plants. The first prize for a collection of the finest Palms was won by La Société Horticole Gantoise with remarkably fine plants. The gold medal of the Royal Horticultural Society of England was also given to this group. Some of the plants were huge specimens, some reaching to the top of the building, and quite 30 feet to 40 feet high. Some of the best of them were Sabal sp., Caryota urens, Kentia australis, K. fosteriana, Areca sapida, Livistona rotundifolia, Chamærops ataurachanta, Kentia Lindeni, Rhapis flabelliformis (about 12 feet high and the same through), and Phœnix Roebelini, a very elegant Palm. This was a splendid group and very large, filling a good part of one side of the hall. The second prize for a group of Palms went to MM. de Smet frères, Ghent, who also had splendid plants.

M. L. Shae, Vandermeulen, was first for twelve Palms, and showed some fine plants. Sabal blackburniana, Areca sapida, and Rhapis humilis were splendid. M. A. de Smet, Ledeburg, had the best specimen of Rhapis humilis, a grand plant some 15 feet high, and M. H. Millet-Richard, Ledeburg, was first for a collection of fifteen rare Palms. Included were Geonoma Leemanni, Linospadix petrickiana, Licuala grandis, Wallichia oblongifolia, Latania aurea, Chamædorea geonomæformis, and other rare Palms.

In the class for a new Palm not in commerce M. P. de Bruycker, Ghentbrugge, was first with Kentia elegans, an attractive plant some 4 feet high, with elegant leaves, slender leaflets, and very graceful appearance.

M. L. de Smet Duvivier, Mont St. Amand, Ghent, won the gold medal offered by Count Chandon de Briailles for a new plant with a Palm, Cyrtostachys renda var. duvivieriana. It is of stiff habit of growth, like an Areca somewhat, with striking bright red stems and leaf stalks, leaves a good green with red midribs. The plant shown was from 6 feet to 8 feet high.

Cycads.

M. de Ghellinck de Walle, Chatean de Wondelgem, won the first prize for the best fifteen Cycads, showing splendid plants. One is of immense size, as, for instance, Encephalartos caffra, Zamia villosa, Z. horrida, Z. funiculata, Z. Lehmanni glauca, Z. Altensteinii, Lepidozamia Macleayi, and L. peroffskiana.

Ferns.

Collection of thirty Tree and other Ferns: First prize, M. le Comte de Kerchove de Denterghem, with grand plants of Alsophila australis, Woodwardia radicans, Cyathea medullaris, Cibotium Barometz (very elegant, black stems), Nephrolepis bostoniensis, and Adiantum pentadactylon. M. Pynaert also won a first prize in another similar class. Cibotium Schudei (?), Angiopteris fraxinifolia, and Nephrolepis bostoniensis were the best.

M. Pynaert was also first for a collection of thirty exotic Ferns (not Tree). Todea africana was the best.

Aroids.

For a collection of twenty-five Anthuriums in flower, M. A. de Smet was first with some very fine plants, particularly A. schertzerianum Wardi (large scarlet spathes), A. S. roseum, A. S. President Steyaert (large, blood-red), A. S.

Still, there can be no doubt whatever that it is preferable to sow sufficiently late, so that the plants do not remain too long in the seed-bed. There should be no rest or wait between the time the plants are above the soil and of planting. The best Broccolis I have seen are those given field culture, and treated as advised, that is an ample seed-bed, early planting before the plants are weakened by overcrowding, and after the planting there is no coddling, that is, the plants are thoroughly exposed and make a sturdier growth than in rich garden soil. As regards sowing a certain date cannot be given to suit all parts of the country. In the South the early Broccoli is one of the best paying crops grown, and, though my note refers more to the value of the late supplies, I would add the early spring varieties are equally valuable.

It will be found in such seasons as this that if the late Broccolis are earlier than usual, other green crops, such as the Borecoles, will be soon over. This will result in scarcity for a short time, but it is a simple matter to keep the small late heads of Broccoli later by lifting and laying in under a north wall and screening from bright sunshine. Treated thus, quite a fortnight's time as regards the supply will be secured.

There is no gain whatever in sowing late, as the plants do not pay. They must have a fair season's growth, and when sown too late the result is disappointing. Of course, much may be done to keep up a full supply by sowing late varieties, but these cannot always be trusted. This year we are cutting June Monarch early in April, but there are some compensations, as when the Broccoli is erratic the spring Cabbage is much earlier. This is a great gain, as if one fails the other comes in to take its place.

Another point the grower should always bear in mind is that no plant can stand extremes of heat and cold, rain, and snow if not strong and well-rooted. It is the weak ones that fall out, and it is well to get a good plant to stand our variable winters.

I have referred to soil and position. With regard to the former I have always got the best supplies from a deeply-dug or holding soil. This results in a more solid growth, and, given free exposure, there are fewer losses. In many gardens the Broccoli crop cannot get much attention, and even with the best culture there are great losses in severe winters. I have found fewer plants die when grown on as advised. Our soil is very light, but we get a hard root-run by planting on land from which the early or first Strawberries have just been cleared. For the latter crop the soil is trenched, well manured, and the early plants only occupy one season, as our object is fine fruit. The Strawberries are hoed off and the Broccoli placed in position: they are planted between the rows, the land being very hard and trodden. Of course, to do this good plants is necessary, and this is easily managed by pricking out the seedlings if the season is late.

Our best late Broccolis are not numerous, and I will only refer to those I have grown for some time, and these, in my opinion, are far superior to the huge heads grown a quarter of a century ago. For home supplies—that is, the private garden—two varieties should be grown in all gardens where delicate, medium-sized heads are required for use from April to June. Veitch's Model is one of the best introductions of late years, and very little inferior to the best Cauliflowers: it is very hardy, of fine texture, beautifully white, and well protected with its folding foliage. This variety is very distinct, the heads being conical, remarkably close and compact, and of splendid flavour. We usually have this variety on three quarters to get a long supply, and in severe seasons the plants on a north border escaped when those on a warmer one were killed.

Another very fine late Broccoli is Sutton's Late Queen. It is as valuable as Model, and one of the hardiest sorts grown. I have had it at midsummer in the northern part of the kingdom; indeed, it never failed, as it is a dwarf grower and a splendid garden variety. Another very late variety, also hardy, is Carter's Champion, which is a very fine Broccoli. June Monarch is also good, very late, and hardy. A favourite Broccoli in Scotland and the North is Methven's; it gives a close, compact head, and is a well-flavoured variety. The old Cattell's Eclipse is also hardy, but many do not like its sulphur colour. It is still a favourite for field culture. G. Wythes.

OBITUARY.

ANDREW PETTIGREW.

It is with deep regret that we announce the death of Mr. Andrew Pettigrew, of Cardiff Castle Gardens, which took place on Sunday morning last, April 26. Mr. Pettigrew, who was seventy years of age, had been seriously ill for some weeks. By his death we lose one of the most notable of British gardeners. Mr. Pettigrew was known throughout the kingdom as an expert horticulturist, more particularly as a fruit grower, and

THE LATE MR. ANDREW PETTIGREW.

was greatly respected wherever known. His face will be missed by many at horticultural gatherings.

Even those who did not know him personally will hear with great regret of his death, for Andrew Pettigrew was a household word in gardening circles, while those who had the pleasure of close acquaintance with him will remember him as an honourable, just yet generous and warm-hearted man, and a typical Scottish gardener.

Mr. Pettigrew commenced work in an Ayrshire garden at the early age of twelve, and subsequently worked in the following gardens for periods varying from nine months to two years: Craigie House (Ayr), Dalblair House (Ayr), Rozelle House (Ayr), Sheffield Botanic Gardens, Minard Castle, Drumlanrig Castle, Stoke Farm, Daylesford House, and Rollinson's Nurseries, Tooting. At the age of twenty-nine Mr. Pettigrew was appointed head gardener to the late C. Meeking, Esq., Richings Park, Bucks, and remained there for six years. Then, greatly against the wishes of his employer, he returned to Scotland to take charge of the late Marquis of Bute's gardens at Dumfries House, Ayrshire. After six years' service there Mr. Pettigrew, at the request of the Marquis, went to South Wales to lay out the gardens around Cardiff Castle.

Subsequently Mr. Pettigrew formed the famous vineyards and successfully conducted experiments in wine making after spending some time in visiting vineyards in France and studying the methods of wine making there. Mr. Pettigrew had been in the service of the Bute family for thirty-six years. The pot Vines and Melons, as well as the specimen Apple and Pear trees in the gardens of Cardiff Castle, we have rarely, if ever, seen equalled, and Mr. Pettigrew was justly proud of them. He was a thorough gardener, and took delight in excelling in his profession.

Several eminent gardeners of to-day have spent some time in the Cardiff Castle Gardens under Mr. Pettigrew, and it is not too much to say that in a large degree they owe their present success to the knowledge gained under his thorough tuition. Mr. Pettigrew was a Fellow of the Royal Horticultural Society, before which he has lectured on several occasions. He was a valued contributor to our columns. Great sympathy will be felt with Mrs. Pettigrew, her three sons and daughter in their bereavement.

JAMES W. WITHERS.

Mr. Withers, of the *American Gardening* Publishing Company, New York, died on April 13 in Jamaica, West Indies, whither he had gone in hopes of recuperating his health.

Mr. Withers was born in Welshpool, Montgomeryshire, England, forty-two years ago. Going to America in 1892, Mr. Withers entered the employment of the Oasis Nursery Company. In 1894 he joined the staff of the *Florists' Exchange*. In October, 1898, he purchased *American Gardening*. During his stay in the United States the deceased did some excellent work in the cause of horticulture. He took a keen interest in exhibitions, and did everything in his power to encourage them. He was an active worker in various horticultural organisations. In the untimely death of Mr. Withers horticulture has surely lost a valued exponent and true friend. —*The Florists' Exchange.*

THE LATE MR. BARRON, V.M.H.

Your pages are always open to those who advocate the claims of our gardening charities or who work in their behalf. Our good friend and worthy horticulturist, Mr. A. F. Barron, will be remembered as one who did much for the widow and orphan. Few were his equals with regard to fruit, especially hardy fruit culture. As a judge of fruits it was a pleasure for anyone to be associated with him. There is no occasion to point out the late Mr. Barron's qualities. These were testified to when he resigned the position as superintendent of the Royal Horticultural Society's gardens by the testimonial of £500 presented to him on that occasion. We all regret the loss of such men, and sympathise with those he has left behind. G. Wythes.

Mr. A. F. Barron's Book of the Vine.

The late Mr. A. F. Barron undoubtedly possessed a wide knowledge of fruits, and a good deal of that knowledge may be found incorporated in the "Fruit Manual" and other books to which he was a contributor but not the author. He left behind, however, one book at least that is a standard authority, viz., his "Book of the Vine." It is without doubt the best and most authoritative work on the subject that has ever been issued from the press, and has the merit of being not merely fully but most truthfully illustrated. Mr. Barron had a very matter-of-fact mind, and he carried that fact thoroughly into his book. For that reason it is found on all gardeners' book-shelves, and is the work of reference when Vines are in question. It is not a big book by any means, but it is one that will live long after many other books have been forgotten.

It is very difficult indeed to keep books on gardening up to date, the progress made being so rapid, but the Vine progresses very slowly; indeed, the varieties held in the highest esteem twenty years ago or much longer are still the best varieties of to-day, and, judging by the rate with which new varieties of Grapes are introduced that make reputations, it is just possible that a century may elapse ere we shall see Black Hamburgh, Madresfield Court, Muscat of Alexandria, Mrs. Pince, Black Muscat, Gros Colman, Black Alicante, Lady Downe's, and Foster's Seedling displaced.

Of the several varieties that have received awards or been put into commerce during the past ten years hardly one has yet made any reputation. Something may be due to the fact that Vines can only do so very slowly. It is this fact that lends such value to the late Mr. Barron's book, and must for many years yet to come make it the standard work on the Vine in British horticulture. A. D.

BOOKS.

The Chrysanthemum: History, Classification, Description, and Culture.—This in plain English is the title of a new book that has just been published in the Italian language by a Mr. Dario Formilli of Rome. It is a pretty book, and, judging by its bulk, it is likely to prove to be a very useful one. It is the first book that has ever been written in Italian on the subject of the Chrysanthemum, and for style and comprehensiveness is an example to be imitated. We cannot compare it with any other book that we know of or with which our readers are familiar, but if we did we should be inclined to say that it was a happy blending of styles analogous to "Le Chrysanthème, by Anatole Cordonnier, and the Chrysanthemum Album published by Sautel, whose coloured engravings are vividly recalled to our memory by those in Mr. Formilli's book. The author certainly deals with his subject in a very liberal manner, and seems to have spared no expense in producing a useful and, at the same time, well-executed cultural and historical manual. History, the various types with illustrations in black and white, literature, culture for all the many purposes to which the Chrysanthemum is put are freely and ably dealt with. Various composts, formulæ for liquid manures and mixtures to combat the rust, &c., are also supplied. Then there are lists of the best varieties for all kinds of purposes, besides much other literary matter, which we cannot even briefly review. The book is a substantial volume, well printed, freely illustrated, and one that we hope will materially help to extend the culture of the Chrysanthemum in Italy and to add to the dignity and well-being of the Italian National Chrysanthemum Society, after whose late president, Mr. A. Scalarandis, the variety forming the coloured frontispiece is named.

SOCIETIES.

CROYDON HORTICULTURAL SOCIETY.

This society has every reason to be pleased with its third annual exhibition of spring flowers and plants, which was held recently in the Art Galleries, Park Lane, Croydon. The objects of the society are not for the purpose of enabling its members to obtain monetary and other rewards for the particular branch of horticulture in which they may be engaged or take up as a hobby, but to create and encourage a love of horticulture amongst the masses, and this is certainly brought about by exhibitions such as this. Purely for the love of horticulture professional and amateur gardeners enter into friendly rivalry, and certainly with the result that year by year one sees an advance on the exhibitions of previous years. There were on this occasion more entrie than previously, and the quality throughout was of a higher standard. The exhibition consisted of collections of plants and Ferns, which were gronped round the wal and in the centre of the room. Amongst some of the most prominent groups visitors could not fail to be etruck by those of Mr. M. E. Mills, gardener to Mr. F. Lloyd, of Coombe House, who had a collection of herbaceous plants, including some fine specimens of the Narcissus Emperor and Empress blooms, and also showed a splendid collection of Primula obconica. Mr. J. Dingwall, gardener to Mr. F. Stanley, J.P., of Cumberlow, South Norwood, in a tastefully-arranged gronp of flowers and plants, exhibited a splendid specimen of Amaryllis. Mr. A. May, gardener to Mr. Wickham Noakes, of Selsdon Park, had a collection of Cinerarias of delicate tints and shades, and other collections of flowers, Ferns, &c., were sent by Mr. F. Oxtoby, gardener to Mr. J. J. Reid, of Coombe Lodge; Mr. E. Perrett, gardener to Mrs. Fuller, of Hollywood, Duppas Hill; Mr. W. Bentley, gardener to Mr. George Curling, of Elgin House, Addiscombe; and Mr. J. R. Ball, gardener to Mr. A. D. Klaber, of Norhyrst, South Norwood, who also showed some forced French beans. Amongst the nurserymen Mr. Butcher, of South Norwood, in the centre of the gallery grouped a first-rate collection of Palms, plants, Ferns, &c., the effect of which was much enhanced by the magnificent bouquets of Roses Gloire de Dijon and La France, which occupied prominent positions at each end of the group. Messrs. J. R. Box and Co. of Derby Road, Croydon, had some excellent spring flowers, including the finest variety of the Barri section, Dorothy E. Wemyss; also an interesting collection of alpine plants, showing how these can be utilised in Japanese art pots for table decorations. Messrs. J. Peed and Sons, of West Norwood, had a similar exhibition of alpine plants. A feature of the show was the group of Orchids sent by Mr. E. Kromer, of Bandon Hill.

MIDLAND DAFFODIL SHOW.

NEW DAFFODILS AT BIRMINGHAM.

As the exhibition of the above society at Birmingham is regarded as the leading competitive display of the flower in the kingdom, it is not to be wondered at that new varieties find their way there from all parts. The judges and the leading experts present form a floral committee and act precisely in the same manner as the Daffodil committee at the Drill Hall. A large number of novelties were staged by the Rev. G. H. Engleheart, Miss Willmott, Messrs. Barr and Sons, Messrs. de Graaff and Son, and others, and the following varieties obtained awards of merit. No first-class certificate was granted, the Daffodil experts apparently holding the opinion that unless their allocation is challenged by something most distinctly novel it is best to make awards of merit in the first instance, leaving it open to make the higher award of a first-class certificate later on.

The Rev. G. H. Engleheart was, as usual, in strong force, and he obtained awards of merit for the following:—

Strongbow.—Of the character of Nelsoni, having a broad, white, overlapping perianth, and a long, clear yellow and somewhat spreading cup.

Laureate.—A very large form of the Poeticus type, white, with a large flat cup like that of Poetarum.

Salmonea.—A rather small and star-shaped Burbidgei, perianth white, with a delicate orange cup, paler on the edge, almost to white.

White Ensign.—Another Burbidgei, having a broad, pure white overlapping perianth and large flat yellow cup slightly stained on the edge.

Broadwing.—Somewhat of the same character; large pure white perianth, and a large and somewhat flat yellow cup margined with light orange. It was stated that the whole of the stock of this was disposed of on the day the award was made.

Castille.—A large Barrii type, soft lemon, star-shaped perianth, with a medium-sized spreading cup of bright orange.

Hyacinth.—One of the flat crowned varieties Mr. Engleheart has produced, the perianth pnre white, the flat cup clear lemon-yellow; a rather small-sized variety with a distinct perfume.

Miss Willmott obtained awards of merit for

Lemon Queen.—An incomparabilis type having a large soft yellow perianth and spreading cup of a darker yellow, but smaller in proportion to the perianth.

Red Charles Digby.—A Johnstoni bicolor, with small white open perianth and large soft yellow trumpet.

Cecil Rhodes.—Also of the Johnstoni type, in colour pale lemon yellow, having a flat open perianth and long straight trumpet.

Corydon.—One of the Backhousei type, having a creamy overlapping perianth and soft yellow spreading cup of the Sir Watkin type.

Ducat.—A medium-sized well-formed trumpet variety, like an undersized but refined Golden Spur.

Moonray.—A hybrid of triandrus, having a pure white expanded cup and perianth, somewhat in the way of Moonstone, but the perianth is more open and the cup not quite so bold.

Messrs. Pope and Son received an award of merit for

King's Norton, which might be described as a giant Emperor, the trumpet large and rather bolder than in the case of King Alfred, but with scarcely so solid a perianth, which is of a primrose-yellow shade.

Messrs. Barr and Sons obtained awards of merit for

Cleopatra.—A large yellow trumpet variety, having a broad flat overlapping perianth, and may be best described as a refined Glory of Leiden.

Cygnet.—A bicolor, the white perianth inclined to curl and twist inwards; soft yellow trumpet somewhat open at the mouth.

Loveliness.—Broad overlapping perianth and pure white trumpet, rather long; an enlarged Mme. de Graaf.

Mrs. George Barr.—Another white trumpet in the way of Loveliness, and may be said to be intermediate between it and Mrs. Robert Sydenham, described below.

Messrs. de Graaff and Sons, Leiden, secured awards of merit for

Mrs. Robert Sydenham.—In the way of Messrs. Barr and Sons' Loveliness, but with a rather longer and more open trumpet.

Francesca.—Broad white overlapping segments of the perianth, and short but fine open trumpet; one of the best of the new varieties shown.

Odorus Rugulosus maximus.—A very fine form of the type, but of a rich deep yellow tint, and though one flower only was produced on a stem it is thonght it may run to two.

Apricot Phœnix.—A fine double form in the way of Primrose Phœnix, but flushed with deep apricot at the base.

The Rev. G. H. Engleheart had among his new varieties a single flower of prodigious size, the perianth of which measured 5 inches in diameter, and the trumpet nearly 3 inches in depth; it is of the Emperor type, and is to be known under the name of Royal. R. D.

A GROUP OF DAFFODIL ENTHUSIASTS AT THE MIDLAND DAFFODIL SOCIETY'S SHOW.

Standing (reading from left to right): Mr. W. B. Latham, Mr. John Pope, Mr. Herbert Smith (hon. secretary), Mr. R. C. Cartwright, Mr. Robert Sydenham (treasurer), and Mr. E. M. Crosfield. Sitting: Mr. P. Rudolph Barr, the Rev. G. H. Engleheart, and the Rev. S. E. Bourne.

Oxford Dictionary of National Biography

Barron, William (1805–1891), *landscape gardener*
by Brent Elliott, *rev.*
© **Oxford University Press 2004–14** All rights reserved

Barron, William (1805–1891), landscape gardener, was born on 7 September 1805 in Eccles, Berwickshire, the son of John Barron, gardener, and his wife, Betty Johnston. (The year of his birth is usually cited as 1800, as a result of a mistake in his obituary in the *Gardeners' Chronicle*.) He served a three-year gardening apprenticeship at Blackadder, Berwickshire, before entering the Royal Botanic Garden, Edinburgh, where he was soon placed in charge of the glasshouses. From there he went to Syon House, Middlesex, where he helped to plant the new conservatory. On 1 March 1830 he was appointed gardener to Charles Stanhope, fourth earl of Harrington, at Elvaston Castle in Derbyshire, where he took up his post on 2 August, with instructions to create a new garden.

Early in 1831 Barron began transplanting mature trees; he became expert in their removal and he described his techniques in *The British Winter Garden* (1852). The gardens he created were seldom visited before 1851, when a series of articles in the *Gardeners' Chronicle* created a sensation by describing the transplanting operations, the grafted conifers, the avenues of multiple rows of different species, the architectural topiary, and the series of formal gardens enclosed by hedges. The revelation of Elvaston led to a topiary revival in the 1850s.

The fourth earl died in 1851 and his successor retrenched on expenditure, opened the gardens to the public, and instructed Barron to develop a commercial nursery at the garden. In 1862, on the death of Leicester Stanhope, fifth earl of Harrington, Barron bought 40 acres for a nursery site in nearby Borrowash, to which he moved from Elvaston in 1865. In addition to plant sales, Barron offered transplanting and landscape gardening. During Barron's life, among his firm's commissions were those undertaken at Stancliffe Hall, Matlock; Impney Hall, Droitwich; Locke Park, Barnsley; People's Park, Grimsby; and, his most famous work after Elvaston itself, Abbey Park, Leicester (between 1877 and 1882). In 1880 he successfully moved the Buckland yew, with a documented age of 800 years. One of his transplanting machines was preserved at Kew.

Barron retired in 1881 but came out of retirement for a commission for the ninth earl of Dysart, at Welbeck Abbey, in 1886. In 1887 he was the first witness called before the select commission on forestry. He was noted for his prodigious memory, he was deeply religious, and he was a staunch advocate of temperance.

Barron married Elizabeth Ashby, and their only child, John (born on 8 June 1844), having trained abroad in landscape gardening, became his father's partner by 1867. Barron died in Borrowash, Derbyshire, on 8 April 1891. The family continued the firm into the inter-war years. Among the firm's later commissions were those at Queen's Park, Chesterfield (1893); the Bedford Embankment (1894); and Whitaker Park, Rawtenstall (1900).

Obituary.

Samuel Cooper.—We regret to record the death of the well-known nurseryman and seedsman, Mr. S. Cooper, of Hadleigh, Suffolk, who died on Friday, April 3, at the age of sixty-nine. The deceased was born at Humberston, Leicestershire, and early in life he held several responsible positions in nurseries and gardens in England. Removing to Scotland, he was for some time in the gardens of Dalkeith Palace, the residence of the Duke of Beccleugh. After this, he established for himself a very successful business at Wellingborough; and finally, some twenty-five years since, removed to Hadleigh, where he extended the nurseries, and, with the aid of his son (who will in future carry on the business) worked up a very good connection.

H. G. Bard.—The death has recently taken place of Mr. H. G. Bard, whose name some twenty years ago, whilst in the service of E. G. Henderson & Son, of the Wellington Road Nurseries, was well known in connection with the new varieties of Bouvardias, Fuchsias, then being introduced. He afterwards entered the service of Messrs. James Carter & Co., with whom he will be best remembered as having been engaged for a series of years in the fertilisation and raising of their crossbred Wheats.

John Dykes.—Nurseryman, Kilmarnock, N.B., on April 10, aged 80 years. The business will be carried on by Mr. J. C. Dykes, the remaining partner.

William Barron.—William Barron, of Elvaston, has for long years past been a well-known name in Horticulture. By nature keen and shrewd, long experience had made him a first-rate gardener, and one whose knowledge of trees and their ways was unique. Of his early history we propose to speak on another occasion; it must suffice now to mention that he was gardener for some years at Elvaston Castle, on leaving which he entered into business as a nurseryman and landscape gardener at Borrowash, near Derby, within sight of the garden he had done so much to make famous. Here he accumulated a large and varied collection of hardy trees and shrubs, especially Conifers, with which he had a special acquaintance. He had large experience in the moving of large trees, undertaking, with confidence, tasks in this direction from which others would have and did shrink. One of his feats in this way was his removal of an old Yew in the churchyard at Buckland, near Dover. In common with others who were consulted, we at the time expressed an adverse opinion as to the propriety of the proceeding, but we had to confess, and we may repeat it now, that the operation was performed without material damage to the tree, which was in good condition when we saw it last a year or two ago. Illustrations of this remarkable tree, and of the process of its removal, were given in our columns at the time.

Next week we hope to be able to publish a portrait of this remarkable man, together with some further details as to his career. Mr. Barron, who had retired from business a year or two ago, died on the 8th inst., in the eighty-sixth year of his age.

Orchid-bloom in variety.

Old Potatos.—A further rise of 10*s.* per ton for all kinds has taken place since last report with upward tendency.

New Potatos.—The demand has been somewhat brisk, with a gradual rise in values Arrivals light. *J. B. Thomas.*

SEEDS.

London: *April* 15. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report a quiet, steady demand for Clover and other seeds at last Monday's prices. From the moderate stocks held, the sowing wants of the vast majority of English farmers have yet to be satisfied. The present season is proving to be a most remarkably backward one. In Rape seed the late advance is well sustained. Mustard shows no alteration. The tendency in Canary and Hemp seed is upward. Peas and Haricots have further risen in value, and the supplies of both articles seem nearly exhausted.

FRUIT AND VEGETABLES.

Stratford: *April* 14.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 3*s.* to 5*s.* per tally; Savoys, 5*s.* to 8*s.* do.; Greens, 1*s.* 6*d.* to 2*s.* 6*d.* per sieve; do., 2*s.* to 5*s.* per dozen bunches; Cauliflowers, 2*s.* to 3*s.* 6*d.* per dozen; do. 9*s.* to 15*s.* per tally; Turnips, 30*s.* to 40*s.* per ton; Carrots, household, 100*s.* to 120*s.* do.; do., cattle feeding, 36*s.* to 40*s.* do.; Parsnips, 1*s.* to 2*s.* 6*d.* per score; Mangels, 24*s.* to 26*s.* per ton; Onions, English, 110*s.* to 130*s.*; do., Dutch, 3*s.* to 5*s.* 3*d.* per bag; Apples, English, 3*s.* to 7*s.* per bushel; Watercress, 7*d.* per dozen; Cress, hot and cold, 1*s.* 9*d.* to 2*s.* per dozen bunches; Radishes, 9*d.* to 1*s.* per dozen bundles; spring Onions, 5*s.* to 7*s.* do.

POTATOS.

Borough and Spitalfields: *April* 14.—Quotations:—Hebrons, 120*s.* to 130*s.*; Imperators, 120*s.* to 140*s.*; Champions, 110*s.*; Regents, 120*s.*; Magnums, 110*s.* to 140*s.* per ton.

Spitalfields: *April* 15.—Quotations:—Magnums, 110*s.* to 140*s.*; Hebrons, 110*s.* to 130*s.*; Regents, 110*s.* to 120*s.*; Imperators, 120*s.* to 140*s.*; Champions, 110*s.*; Early Rose, 110*s.* per ton.

Stratford: *April* 14.—Quotations.—Imperators, 110*s.* to 130*s.*; Magnums, 110*s.* to 140*s.*; Hebrons, 110*s.* to 130*s.*; Elephants, 110*s.* to 130*s.*; Scotch Magnums, 120*s.* to 140*s.* per ton.

The Weather.

By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (—) the Mean for the week ending April 11.	Accumulated. Above 42°, for the Week.	Below 42°, for the Week. The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts — 1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.

Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N. 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending April 11, is furnished from the Meteorological Office:—

"The *weather* was showery and changeable, with thunder and lightning in places during the first two days of the period, but afterwards became dry, with generally overcast skies.

"The *temperature* rose considerably during the earlier part of the time, and means varying between 56° and 59° were recorded in most of the English districts, and between 52° and 56° over Ireland and Scotland. During the latter part of the week, however, the maxima were generally below 50°. The lowest of the minima were registered on the 8th, when the thermometer fell to 21° in 'Scotland, N.,' 25° in 'Scotland, E.,' and over Ireland, to between 27° and 32° in most other districts, and to 36° in the 'Channel Islands.' The average values for the week have been in most cases from 2° to 4° below the mean for the time of year.

"The *rainfall* has been more than the mean in 'England, N.E.,' and about equal to it in the 'Midland Counties.' In all other districts a deficit is shown.

"The *bright sunshine* has been less prevalent over the Kingdom as a whole than for some time past, the percentage of the possible duration having ranged from 11 to 24 over England, from 23 to 35 in Scotland, and from 23 to 36 in Ireland.'"

Notices to Correspondents.

Alpine and other Strawberries: *W. C. C.* Where the runners are not to be obtained, and even as a matter of ordinary practice, it is well to raise the Alpine Strawberry from seed, by sowing in pans in February and March, or even at the present time. It should be sown thinly in loam and leaf-mould, about 1-inch layer of fine sifted soil, laying on 2 inches of loamy lumps, of the size of hazel nuts; these again over-laying a few crocks. The lumps afford root-hold, and most of the seedlings will lift with one or more attached to the roots. The earliest sowings should be raised in heat of 60° to 70°, and the pans should be put close to

vellous growth is obtained on the large specimens of Cattleya gigas, some of which produce five or six massive flower-spikes, whose beauty can easily be imagined. At present there are some fine forms of C. Trianæ in bloom, especially good being one with fine sepals and petals, and rich glowing purplish-crimson lip. The light forms of the delicata type, too, are exceptionally good, and some of the earliest C. Mendelii are already in flower. The Dendrobe-house was a mass of bloom, although it was said to be past its best. In it were noted Dendrobium fimbriatum, with twelve spikes; three well-bloomed forms of D. Ainsworthii ×; and D. A. roseum; D. primulinum, with eight flowering bulbs; D. crassinode Barberianum, with nearly one hundred flowers; some excellent forms of D. nobile, D. Brymerianum, D. crassinode album, D. Wardianum, D. Devonianum, &c.; and the specimens of D. thyrsiflorum and D. densiflorum are profusely furnished with flower-spikes.

The Cool Range

in three divisions, has in the first a grandly-grown batch of Miltonia vexillaria well set with buds, and various Lælias, &c., a good show of flowers being on the L. harpophylla and Bifrenaria Harrisoniæ, and the rare Cymbidium tigrinum is in bud. In the second division are a fine specimen of Odontoglossum luteo-purpureum, with four spikes; some superb forms of O. Pescatorei—one with a twelve-branched spike; Platyclinis glumacea, with many of its elegant sprays; Oncidium Marshallianum, &c. The third division is filled exclusively with Odontoglossums and Masdevallias, and a magnificent show is made by the many fine sprays of O. triumphans, O. crispum, and O. Pescatorei, together with the rare O. tentaculatum; some excellent O. Halli, O. Edwardii, O. luteo-purpureum, and other Odontoglossums, and the many bright flowers of the varieties of Masdevallia ignea. Of O. Pescatorei there is a large quantity in bloom, and the strain seems to be a specially good one, many of the varieties having large flat labellums richly marked with purple, and some also exhibiting spotting on the petals. The type of O. crispum, too, is of the best class, the flowers very large, and some of the small plants of the spotted forms flowering for the first time very promising.

In the large plant-houses, in the centre of one of which is a great specimen of Anthurium Schertzerianum with over one hundred of its scarlet spathes, are in bloom, a good lot of Lycaste Skinneri, L. plana, Cymbidium Lowianum, Oncidium leucochilum, Calanthe vestita gigantea, a lot of good Cypripediums, some Phalænopsis, Cœlogyne cristata alba, Cattleya amethystoglossa, Epidendrum Wallisii, &c.

The fine display of cut Orchids tastefully arranged in the drawing-room is worthy of mention, in order to call attention to the elegant manner in which the sprays of Heuchera sanguinea (illustrated in the *Gardeners' Chronicle*, August 4, 1888, p. 125), arrange with those more massive flowers.

BOURNE PLACE.

The residence of John Flower Jackson, Esq., also has a rising collection of Orchids, among which, on the occasion of our visit, we found both Mr. Jackson and his son busily engaged. Here the species of Phalænopsis thrive remarkably well, small plants rapidly growing into large ones, which is the reverse to what is experienced in many collections. The foliage of these plants is thick and firm, and each leaf displays an advance in size over the one made before. The house is kept moist, and on the wet stages we noted some lumps of rock-salt which may contribute to the healthy character of the plants, for it will be remembered that salt used to be sprinkled in the house in which the fine plants of the Partington collection grew. Among those we noted were the rich crimson-centred P. amabilis Dayana, and sundry ordinary P. amabilis, P. grandiflora, several P. Schilleriana, P. Sanderiana, and a very large plant of P. Luddemanniana with abnormally long spikes, which will soon give a rich display of bloom.

In the Cool-houses,

the plants are placed on open stages, made of frames covered with fine half-inch wire netting (the same as at Bridgen Place), stand over a close stage, covered with shingle to be kept moist, and it must be said that better results in both plants and flowers could scarcely be attained. At one entrance, purposely placed by the door for the better access of air, is a batch of very large-bulbed Epidendrum vitellinum, and throughout the whole house a good show of Odontoglossum is made, among the plants being that exquisite violet-spotted form of O. Pescatorei, which Mr. Jackson exhibited a year or two ago. Also in this house is a showy specimen of Cypripedium Boxalli with twenty-two flowers, and on a narrow shelf at the end a pretty show of Odontoglossum Rossii majus. In another part is a grand bank of Orchids in bloom, made up of many Odontoglossum triumphans, O. crispum, and O. Pescatorei, with some O. Cervantesii; O. Rossii rubescens, O. cordatum, O. maculatum, a noble form of O. nebulosum with very large pure white flowers spotted on the inner halves of the segments; various O. odoratum, Cymbidium Lowianum, many Lycaste Skinnerii, Pilumna fragrans, some good Cattleya Trianæ, Masdevallia Lindenii, M. ignea, M. i. coccinea, M. Shuttleworthii, M. triangularis, some scarlet Sophronitis, and Ada aurantiaca, and various others—truly a fine show. In the Cattleya-house the C. Mendelii are coming on, and a stout plant of C. Lawrenciana is in bud.

An arched walk leads from the Orchid-houses to the long orchard-house at the bottom of the garden, and it is worthy of note, by reason of the admirable manner in which it is covered by trained Gooseberries on the one hand, and Morello Cherries on the other, both being said to produce good crops, the Gooseberries being very fine dessert fruits. The orchard-house has been a fine sight, with the bloom on the trees, but in the proper course they are now faded. One end of the house is used as a pleasant resting-place, and a row of Hyacinths and Tulips makes the border bright. In this house, which has a back wall, there is an admirable arrangement for bringing the water from the gutter in front to the tank which is built inside under the back wall. The pipe from the gutter is carried under the bed and walk inside the house, and up the outside wall of the tank to supply over the top on the inside. A very simple arrangement, but one which does not suggest itself to all who build, and who consequently place their tanks in inconvenient places to get near the rain-water shoot.

HONEYDEN, NORTH CRAY.

R. A. Todd, Esq., like Mr. Jackson, was busy in the garden. Here the Orchids are grown for the greater part mixed with flowering stove and greenhouse plants, and the result is very satisfactory. At the entrance of one of the houses, was a good show of Orchids in flower, conspicuous being some good forms of the fragrant pale-lilac Cattleya Schroderæ, behind which was a very fine specimen of a richly-coloured form of Lælia cinnabarina, which had five spikes, each over 2 feet in length, and some plants of Dendrobium Ainsworthii, and other Dendrobes. In the same range, were Vanda suavis, Angræcum polystachyum, Cypripedium callosum, and other Cypripediums; two plants, the one having fine spikes, of the rare Phajus Manni. The largest is made up of several imported pieces potted together, and there is a very marked difference in the flowers, some having the front of the lip yellow, and some white. The scarlet Epidendrum radicans, too, is well-flowered; and the many Catasetums, Mormodes, and other curious plants which Mr. Todd is so fond of, promise to display a goodly number of their quaint spikes. Among the other showy plants in bloom with the Orchids are Hymenocallis guianensis, which has white flowers, the upright tubes of which are 8 inches in length; two specimens of an Amaryllis, near to Hippeastrum regium, each with six spikes; Tillandsia splendens, Meyenia erecta, Euphorbia splendens, Impatiens Sultani, and various other showy stove shrubs. In the cool-house, in the second division of which there are some rare Ferns, the pretty Oncidium pyramense has a showy, branched spike, about 1 foot high; Odontoglossum cirrosum has several spikes; the pretty rare and fragrant Cœlogyne ochracea is in bloom, so also Masdevallia Lindeni; Odontoglossum Rossii majus, with nine spikes, O. Œrstedii majus, and a very large and handsome form of Oncidium maculatum.

WILLIAM BARRON.

This gardener, whose death we announced in our last number, was born at Eccles, in Berwickshire, on September 7, 1800. He was of a very old Scotch family, which originally came from the neighbourhood of Aberdeen. His father was a gardener, and the boy proved a sharp lad at school, subsequently studied Greek and French, and learned sufficient Hebrew to enable him to read the Bible in the original. Having developed a taste for gardening, William Barron was apprenticed at Lady Honstan Boswell's of Blackadder, Berwickshire. During his three years of apprenticeship, he studied his profession with such effect, that when, through the influence of his employer, he obtained admission to the Botanic Gardens, Edinburgh, he was, much to his own surprise, put (after an examination in Botany) into full charge of the houses there, by the elder Mr. William McNab, who was at that time probably the best practical botanist in Britain. Barron continued in this situation two years, during which time he attended the botanical lectures under Professor Graham for three terms, and together with the late Mr. James McNab (who was somewhat his junior), attended Chemical lectures in the evenings, under Professor Turner, and lectures in Natural Philosophy and Mechanics under Professor Lee.

Having expressed a wish to obtain some experience in Pine forcing, he was sent by Mr. McNab to the Duke of Northumberland's, at Sion House, Isleworth, and while there he assisted to plant the large conservatory. On March 1, 1830, he was appointed to lay out the grounds at Elvaston Castle, Derbyshire, for Charles, 4th Earl of Harrington, with whom he remained until the death of the earl, a period of twenty years and eight months. During this time, he began and completed one of the most distinct and regal gardens in Britain. What took place about this time will be best told in his own words:—

"Charles, the fourth Earl of Harrington, was a nobleman every inch of him. I arrived on August 2, 1830. The whole country was at that time in a fearful political ferment. Nottingham Castle was burnt down early in January, 1831. My mind was strongly impressed to have put in repair a small double-pistoned water-engine much out of repair; both the engine and hose had not been used for years. I had only had them finished on Saturday afternoon early in January, 1831. On the next Sunday morning, about five o'clock, I was awakened by screams on the staircase leading to my room (as I then slept in the castle) that the castle was on fire; I opened my window to prevent suffocation, every place being filled with smoke. I immediately despatched a man on horseback for the fire-engines from Derby; I then got one of the maids to sound the gong, which soon brought a number of my men from the village; meantime, I had ascertained where the fire originated, viz., in the housekeeper's store-room, and as soon as I obtained assistance, I got the engine in position in front of the castle. I then mounted a pair of steps, and dashed the engine-pipe through the shutters and window. The flame came out with such force as nearly knocked me off; I stooped below it, and directed the pipe to the corner where the fire originated, and, with a plentiful supply of water, and willing hands at the engine, I succeeded in putting it out before the fire-engines from Derby arrived. I had also placed a man with a cudgel in each doorway, to prevent any of the roughs from coming into the castle, as nearly 200 of them followed the engines; and all the thanks I got for my civility was a plentiful supply of threats and curses. I then placed two night watchmen around the castle and premises during the whole of the time the county remained in an unsettled state.

"With my morning exertions, I went to bed early, and slept soundly until midnight, when I was awakened by one of the watchmen, who said there was a barn on fire at Aston, a village about two miles off. I jumped out of bed, and partly dressed, I ran out and again sent off a man on horseback for the Derby engines; meantime I sent off our engine and men to work it. I then ordered my mule to be saddled: being a sharp frost at the time, my mule fell twice with me on the ice. As soon as we reached Aston, I found a large barn, full of barley, not thrashed, on fire, with the tiled roof fallen in; we imme-

diately set to work and got it extinguished before the Derby engines arrived. When they came, I was standing on the sidewall, about fifteen feet from the ground, pouring water on the still smoking straw; they were so much annoyed because I had put out both fires without their assistance, that the chief fireman stood inside the barn-door directing the pipe of his engine to knock me off the wall. I instantly named him, and called out to him that I should have him dismissed from the force. I afterwards had him up before the Mayor, who made him beg my pardon or be dismissed. When the Earl of Harrington came down from London the following April, his first salutation was, 'Barron, you have saved my Castle.' I told him I had only done my duty.

"Before the time of the Fourth Earl of Harrington, nothing had been done to improve or ornament the grounds. There was a kitchen-garden of two acres, surrounded by a brick-wall; no hot-houses, only a Cucumber-frame or two. My worthy predecessor, who had been gardener about forty years was of the old school; he strongly impressed upon me the necessity of seeing well to an open drain which passed through the grounds, telling me that the water stood so near the surface, that nothing would grow much before the month of June. I asked him if the open drain could not be lowered; he said he had done all he could to keep it clear from weeds, but as it entered into the river Derwent a mile and a quarter below, it could not be lowered. I had made up my mind, that after proving his statement to be correct, I should relinquish my charge; but on going over the whole with my spirit-level, I found that commencing a mile from the garden I could lower the stream 4 feet 7 inches. This I did at once, and cut drains through the kitchen garden 6 feet deep, and for days the water ran through the brook with a fœtid smell. Thus the foundation was laid for successful operations all over the grounds. Elvaston, up to 1830, had no public attraction, and on the maps of the county there was only the usual hieroglyphic to indicate the parish church close to the mansion.

"After completing the drainage operations and commencing hothouses, and an additional kitchen garden, in November 1830, his lordship turned my attention to three Cedars of Lebanon in a plantation near the vicarage, which was at that time near the mansion. They were from 28 to 32 feet in height; he asked me if I knew anything of Sir Henry Stewart's mode of removing trees. I replied that I had studied for a time under the person who was gardener to Sir Henry during the time of his operations, so I had a trench cut round all three, and filled in with good soil, to enable them to make new roots, so as to be removed the second year. His lordship then astonished me by saying that he wanted them removed in February, a little more than two months after the operation. I asked him what good he expected from the operation if we were to move them two months hence! Without answering me (as I saw that he was puzzled), he asked if I had read Sir Henry Stewart's book. I told him I had not, but I was perfectly familiar with his practice. He went in, and gave me the book to read. After reading it through, I took it to him, and told him that Sir Henry, with his 'Janker' or 'Timber Wheels,' never had, nor ever could remove trees of the dimensions we had in hand. I saw his lordship's disappointment, and said no such trees as these have ever been successfully removed before, but if your lordship will support me, I will form a plan of my own, and remove your trees, and make them grow. He replied, 'Go on, Barron. That is all I want.' So, in February, 1831, I removed all three successfully into the East Avenue. In November, 1831, following, I removed one from the front of the mansion, 43 feet high, 48 feet diameter of branches, and 2 feet diameter of trunk. Now it is over 10 feet in circumference, at the bottom of the garden of 'Fair Star,' as named by his lordship."

From this time until the death of the Fourth Earl tree moving on the most extensive scale was practised at Elvaston Castle. Mr. Barron scoured the country to find fine specimens, and many old Yew trees, some of them hundreds of years old, were brought from distances of nearly 20 miles The pleasure-grounds, which were practically non-existent in 1831, were gradually extended and most elaborately laid out, until in 1851 they covered about 80 acres.

The ornamental lake was pronounced by all who saw it to be "like a glimpse of fairyland," and the great Duke of Wellington, when he first saw this lake and the rockwork on the islands and mound, exclaimed, "This is the only *natural* artificial rock-work I have ever seen." (See fig. 104, p. 525). The finest specimens of all the rarest Coniferæ at that time existent were obtained, regardless of cost, and planted with profusion. During the Fourth Earl's life, Elvaston Gardens were as a sealed book to the public. His orders were, "If the Queen comes, Barron, show her round; but admit no one else." On his death in 1851, he was succeeded by his brother, Colonel Leicester Stanhope. Up to this time from eighty to ninety men had been constantly employed. What passed at the first interview Mr. Barron had with his new employer, we will give in his own words:—

"He sent for me, and said, 'Now, Barron, I come to the place a poor man, so that I cannot keep it up. All that I can do for you is, to continue your salary, and keep an efficient foreman. I can only afford you eight men and two boys. Your talent cannot be buried here. Your time will be your own. You must go out as a landscape gardener, and I will do all I can to further your interests.' And so he did. During the time that I was enlarging the grounds, every new piece which we were going to take in, I had to make a plan for his lordship's approval, and as soon as it was passed, he was like a child with a new toy, to see it finished, so that in order

Fig. 103.—View in the Gardens, Elvaston Castle: showing clipped yews.

to meet his views, I had formed a reserve nursery-ground, filled with plants of a good size, enabling me to complete the design at once.

"When Leicester the Fifth Earl came into possession, he took me to this reserve nursery, and said, 'Now, Barron, I wish you to sell all these plants for me as soon as you can.' I told him that in order to keep them in a saleable condition, that it would require two men. He said, 'Barron, I cannot afford it.' Then I replied, 'If you cannot afford it, I will try if I can.' I then told him what I would give per annum for the nursery, adding that I would not buy his plants, as he might be told that I had taken advantage of him. He at once said, 'Barron, write out your agreement and I will sign it.' I not only sold all his lordship's plants then in the nursery, but several valuable specimens in the grounds, which I knew could be well spared; amongst others, the finest specimen, now at Osborne, of Picea (Abies) nobilis, I sold for £20. The late Prince Consort lost his only plant at Osborne, and when he returned to Windsor, he came to the Queen's gardener, and said, 'Oh, Ingram, I have lost my plant of Picea nobilis, and the worst of it is I cannot replace it.' Mr. Ingram said, 'Your Royal Highness, I think I can find one.' Afterwards, Mr. Ingram came down to me. I took him into the East Avenue, and showed him a host of them; I pointed out a fine plant, 7 feet 4 inches high. I asked him what he thought it was worth? He at once replied, 'Twenty guineas.' I then said, 'Well, as the Prince is a poor man, he shall have it for pounds instead of guineas; and, to give him confidence in its removal, I am willing to insure it, the first year for 5*s*., and the next two for 5*s*. more.' He told the Prince, and he said, 'By all means pay the insurance.' Before the plant was sent off, I happened to see Mr. Toward from Osborne, and he exclaimed against so large a plant being sent off, saying that 'they were subject to such high winds at Osborne, and to think of sending a plant of that size so far, he was sure it never could succeed.' I told him I had insured it, and it must go. I sent it with a ball of earth about half a ton weight, and it grew about a foot the first year.

"I took a large number of Cedrus deodara, Araucaria imbricata, and other specimen Conifers, to the Crystal Palace grounds, for Sir Joseph Paxton, at prices varying from 3 to 18 guineas. Altogether, I sold plants for his lordship in nine years to the value of £3000, all of which I had propagated or reared."

During these years visitors were admitted to the grounds on a payment of 3*s*. each, which was devoted to various charities; and, notwithstanding the somewhat high charge, many thousands visited the Gardens. Shortly after the death of the Fourth Earl, Mr. Barron published a work under the title of *The British Winter Garden*, which met with a ready sale. Notwithstanding the entreaties of his publisher and friends, Mr. Barron would not allow a second edition to be printed until he had revised the work, which unfortunately he never found time to do. This book is full of valuable hints as to the growth of trees, and the best method of transplanting them. In particular, the evils resulting from planting "pot-bound" trees, up to that time not adequately appreciated, were insisted on and made apparent by striking illustrations.

From 1850 to 1885 he was one of the most prominent figures in the horticultural world, not only as a landscape gardener, but as a great authority in Coniferæ. His labours extended all over Britain, and it was no infrequent occurrence for work under his supervision to be going on in a dozen different counties at once. Soon after the death of the Fifth Earl of Harrington, in 1862, Mr. Barron's Nursery, at Elvaston, having largely increased, he purchased about 40 acres of land at Borrowash, within a mile of Elvaston Gardens, to which he gradually transferred his stock. Conifers were still his hobby, and he never could be induced to sell his choicest specimens. He called them his "Decoy Ducks." His son, who had been studying landscape gardening abroad, having now joined him, he resigned his appointment at Elvaston in 1865, and went to reside at Borrowash.

One of his greatest feats in tree moving he accomplished in 1880, when he successfully removed the Buckland Yew, a huge tree over 1000 years old, mentioned in the Doomsday Book, and which was growing close to Buckland Church, near Dover (see figs. 107, 108, pp. 533, 535). The last public work in which he took an active part was in the laying out of Abbey Park, Leicester, which was opened by the Prince of Wales in 1882; but he afterwards personally superintended extensive alterations for the present Duke of Portland, at Welbeck; and for Earl Dysart, at Buckminster, in 1886. He retired from business at the age of eighty-one, but he was summoned as the first witness before the Commission on Forestry in 1887. Up to the time of his death, which occurred on April 8, 1891, his faculties were unimpaired, with the exception of his previously wonderful memory, which somewhat failed him, after a severe illness in the spring of 1890, although he could still recount with minuteness events which occurred from thirty to seventy years ago. He could both read and write without glasses to within a week of his death. He was a deeply religious man, of the sternest integrity, and under no circumstance did he ever allow his principles to be made subservient to his interests. He was one of the pioneers of the temperance cause at a time when such a course was far more difficult to maintain than at the present day.

The portrait which we affix (see p. 531), was taken a few years since, and is a good likeness of a remarkable man—one who, while he lived by horticulture, never forgot that it was his duty to live for it as well.

DISEASES OF PLANTS.*

(*Continued from p. 460.*)

The association of host-plants is a very interesting aspect of the question, to which sufficient attention has not yet been paid. Take the Gymnosporangia, a very remarkable group, presenting many points of interest, such as the gelatinous aggregation of the teleutospores, the absence of uredospores, their perennial mycelium, the large size and peculiar structure of their æcidia. The teleutospores of the Gymnosporangia are found only upon the Cupressineæ, the Junipers, and their allies, while their æcidiospores, the Rœsteliæ, occur only on the Pomaceæ. Many of these species resemble each other very closely morphologically, but biological research has demonstrated their distinctness.

There are ten species of Puccinia occurring on Carices whose æcidial hosts are known at the present time; of these, no fewer than seven have their corresponding æcidospores upon Compositæ; while of the fifteen species of Puccinia occurring in Gramineæ in Europe, only one is known to have its æcidiospores upon a composite plant (P. poarum). Therefore as the Gymnosporangia have for their associated host plants the Cupressineæ and the Pomaceæ; so of the Pucciniæ, the group affecting the Carices, the most frequently associated host-plants are the Compositæ.

The host-plants of the fifteen graminicolous Pucciniæ are found in the following natural orders:—

Ranunculaceæ	4	Boraginaceæ	1
Rhamnaceæ	2	Orchidaceæ	1
Liliaceæ	2	Compositæ	1
Polygoneæ	2	Aroideæ	1
Berberidaceæ	1	Caprifoliaceæ	1

The association of the æcidial and teleutospore host plants seems, in many instances, to be governed by the environment of the respective plants; if we find a teleutospore growing upon a grass or carex in a damp situation, we expect to find the corresponding Æcidium upon a plant also affecting damp localities—as P. Magnusiana, which has its spore forms on Phragmitis communis and Ranunculus repens; Uromyces junci on Juncus obtusiflorus and Inula dysenterica, P. moliniæ on Molinia cœrulea and Orchis latifolia, P. paludosa on Carex vulgaris and Pedicularis palustris.

On the other hand, species which occur on plants in meadows, such as P. obscura on Luzula campestris and Bellis perennis, Uromyces dactylidis on Dactylis glomerata and Ranunculus bulbosus; or on dry sandy heaths, as P. Schöerliana and arenaricola on Carex arenaria, have their æcidia on Senecio Jacobæa and Centaurea nigra respectively; species growing on the sea-shore, as P. extensicola on C. extensa and Aster tripolium, Uromyces maritimæ on Scirpus maritimus and Glaux maritima.

Favourite Æcidial hosts.—Schröter long since remarked the number of æcidia which occurred upon Ranunculaceæ without corresponding spore forms from his own and subsequent researches it is known that four Pucciniæ, viz., P. persistens, Magnusiana, perplexans, aquilegiæ, and two Uromyces, viz., U. poæ and dactylidis, occur upon plants of this natural order, besides some others whose life history has not yet been elucidated. Some of the commoner Ranunculaceæ are host-plants for more than one species of parasite, thus: R. repens for U. poæ and P. Magnusiana, R. bulbosus for U. dactylidis and P. Magnusiana. In a limited sense, we may therefore say that the Ranunculaceæ are the associated hosts of the grass-dwelling heterœcious species.

The group of plants most highly favoured by the heterœcious Uredineæ for the development of their æcidiospores, however, is the Coniferæ, upon which some eight or ten species are known to occur; three of these are Melampsoræ, viz, M. pinitorqua, M. laricis, and, according to some cultures recently made by myself, M. betulinæ; two Chrysomyxæ, two Cronartia, one Calyptospora, and the well-known Coleosporium senecionis. Of the above, Pinus sylvestris is the host plant for the æcidiospores of Cronartium asclepiadeum, Coleosporium senecionis, Melampsora pinitorqua, and of some other, at present unrecognised, species. On this point I feel convinced, having made a number of artificial cultures with the æcidiospores, as they occur near King's Lynn, on the above host plants with negative results.

On the Larch, as Hartig has shown, one of the Melampsoræ on Populus tremula forms its æcidiospores, but it also harbours the æcidiospores of M. betulinæ.

There are, upon the other hand, several large natural orders, which, so far as we at present know, afford the æcidiospores of no heterœcious Uredine a domicile, such as the Leguminoseæ, Cruciferæ, and Labiatæ; while several smaller orders, as the Rhamnaceæ, Primulaceæ, and Polygoneæ, are the æcidial hosts for more than one heterœcious species. There seems to be a tendency for the æcidia of distinct species to occur on certain host-plants allied to one another; such a favourite group of acidial host-plants is afforded by the Ranunculus repens, bulbosum, and ficaria.

Favourite Teleutospore Hosts.—As far as we at present know, all the Pucciniæ and Uromyces occuring upon grasses, Sedges, and Junci are heterœcious. The same remark applies to those Melampsoræ which occur upon the foliage of deciduous trees; but more than this, certain species of the host-plants support the teleutospores of more than one species. For instance, the common Reed has no less than three Pucciniæ attacking, viz., P. phragmitis, Magnusiana, and Trailii, all of which have distinct life-histories, as well as differing from each other in marked morphological characters.

An even more striking instance is afforded by the common Phalaris arundinacea, upon which no less than four Pucciniæ find a home, namely:—

Puccinia sessilis	æcidiospores on	Allium ursinum.
,, phalaridis	,,	Arum maculatum.
,, digraphidis	,,	Convallaria majalis.
,, coronata	,,	Rhamnus cathartica.

The above-named Pucciniæ, although very similar (excepting the last-named), are quite distinct in their life-histories. Dietel has, indeed, suggested (*Hedwigia*, vol. xxix., 1890, p. 152), that P. sessilis and phalaridis are the same species, which, for some unaccountable reason, sometimes forms its æcidiospores on Allium ursinum, and sometimes on Arum maculatum. On this point, however, he has fallen into error, for I have made several cultures, in which the germinating Puccinia sessilis was applied at the same time to plants of Allium and of Arum, with the result of producing the Æcidium Allii, while the Arum remained healthy. And conversely, P. phalaridis has been applied to Allium and Arum plants at the same time, with the result of producing the Æcidium Ari; but the Allium plants remained free from any infection. With two teleutospores so closely resembling each other, occurring on the same host plant, it is very possible that one may employ for infecting material

* A course of lectures delivered before the Royal College of Surgeons by Professor Plowright, M.D., in February, 1891.

Home Correspondence.

EFFECT OF THE PAST WINTER ON SHRUBS.—Our experience at this place, South Hants, as to the manner in which shrubs have been affected by frost in the past winter, does not agree with the views expressed by Mr. Thiselton Dyer on p. 458, and I think that Mr. Wilks' theory is much nearer the mark. It is found, where shrubs are actually dead, the injury first occurred at the base of the plant. For instance, in Coronilla glauca, Euonymus radicans in variety, Ericas, Veronicas, and Myrtles, the bark comes off the stem close to the ground, while plants of Ceanothus and Escallonia, which have many of their branches killed, are quite sound at the base, as far as the stripping off of the bark is concerned. My conviction is, that those trees and shrubs which have suffered, could not withstand the low temperature with impunity which was experienced on the night of November 28, when the thermometer registered 23° of frost, the lowest of any night during the winter. Following a summer that was cold and damp, the frost came on suddenly at that early date, whilst the new growth was immature. The exceptionally warm months of September and October, moreover, kept plants in a growing state to a later date than usual, especially quick-growing subjects like Veronicas, hence the shrubs suffered to a greater extent than under ordinary conditions. At no time in my experience were shrubs so little prepared to withstand low temperatures as last winter. The reason that shrubs which are now proved to be killed did not turn brown soon after the injury was done, is, in my opinion, due to the fact that the wood retained enough vitality to prevent the foliage suddenly turning brown; but the green colour of the leaves gradually paled, and changed to grey. No plant shows this sequence of conditions more clearly than Euonymus japonicus, which has thick and leathery leaves. Magnolias also provide another case in support of my contention. There was here a striking instance of the buds pushing forth, followed by a total collapse. A plant 7 feet high of Rose Isabella Sprunt growing in a pot was left out-of-doors by accident on the night of the frost, and unprotected in any way; early last month this Rose was stood in a Peach-house, and its buds at once began to break, the buds grew evenly all over the plant, until they were 1 inch long, and then they withered and died, thus proving that this Rose tree possessed sufficient vitality in its shoots to enable it to make some attempt at growth without assistance from the roots, but when that was not forthcoming, owing to the plant being virtually killed, the shoots died forthwith. *South Hants.*

THE BIRMINGHAM BOTANICAL GARDENS.—Calling here a few days since, I noticed in bloom a plant of Pinguicula caudata (the Mexican Butterwort), and what a lovely little plant it is with its soft rich deep carmine-coloured flowers, which in appearance bear a resemb'ance to a flower of Impatiens Sultani. It has an erect and one-flowered scape, and does well in peat and sphagnum, or in fibrous peat and pieces of broken pot, and with cool-house treatment. Hoya globulosa (from the East Indies), is flowering very freely from the roof of an intermediate-house, and the foliage is smaller than H. imperialis, and very thick. The flowers are of a creamy-white colour and fragrant, and abundantly produced. Toxicophlæa spectabilis is always well grown here, some young plants, especially, being profusely flowered. It is an evergreen shrub, doing best in an intermediate-house, having Pittosporum-like foliage and habit, with clusters of pretty white flowers in the axils of the leaves, a plant well deserving more notice than it gets. Ipomœa Horsfalliæ, in one of the stoves, is in full bloom, rich indeed in its glowing rich crimson-carmine colour. *D.*

THE LATE WILLIAM BARRON. (SEE P. 522.)

THE DOUGLAS FIR.—In regard to the doubt as to the existence of what your correspondent calls "inferior varieties" of the Douglas, surely there can be no doubt that the fastest-growing variety from the Pacific slope is altogether inferior in beauty as an ornamental tree to the Colorado variety. I grow both, and can tell them apart at any distance. They have a different scent. *D.*

THE WINTER, AND INSECT LIFE.—The old notion that a severe winter destroys most of our insect enemies will not stand investigation, nor that a severe winter is followed by a good and fruitful season. The winter of 1860—61 was hard enough, and was followed by a disastrous summer. February was the best month of the year 1861; February, again, this year, was fine and bright. To return to insects. The larva of the winter moth is appearing in quantity in some parts, though here we have only a few, owing to several years' combat with that scourge, in which it appears as if we should come out conquerors. Aphis appears on almost everything, so the winter has not affected them; and the same remark applies to slugs, which are more than usually plentiful on newly-planted Cauliflowers, Lettuces, Radishes, Asparagus, &c. *J. T. Wright, Glewston Court Gardens, Ross.*

THE LATE MR. R. H. BARD.—Mr. Bard will always be associated in my memory with the well-known Golden Feather Pyrethrum. I well remember his bringing to a meeting of the Floral Committee of the Royal Horticultural Society, then sitting at South Kensington, a box of this plant, and while its interesting character was universally acknowledged, doubts were expressed as to its durability, and so a Certificate was not awarded at the first time of asking. A day or two after, Mr. Bard put in appearance at a meeting of the then United Horticultural Society at the "Green Dragon" Hotel, in Bishopsgate Street, also bringing with him a box of the Golden Feverfew; when a Certificate of Merit was unanimously adopted. It has proved one of the most useful bedding plants ever distributed. *R. D.*

A BLUE CHRYSANTHEMUM.—In my opinion, this Chrysanthemum, if it ever should arise, is more likely to arise from a sport than a seedling. With varieties at present in cultivation, there is a great tendency that way. I have seen traces of blue in sported flowers which came near to the desired goal. Last season blooms of Lady Dorothy, which is an incurved kind, and itself a sport from Hero of Stoke Newington, showed distinct signs of a colour that was more blue than purple in some parts of its petals, here and there blotches which prompts me to apprise those interested in this novelty to be on the look-out for further freaks of the kind, and to carefully preserve plants which show the slightest inclination to assume a blue colour. It is a well-known fact that some sorts do exhibit signs of sporting several years before an actual sport occurs. *E. M.*

OLD MAN. — Very popular still amongst Londoners is the Southernwood—Artemisia Abrotanum—one of the Wormwoods, the "Boy's Love" of old days; and, in Cockney phraseology, the "Old Man" of later ones. It is, indeed, difficult to understand why a plant, so widely known years since as "Boy's Love," should now obtain such a diverse and contradictory appellation, except it be out of pure "cussedness." Did we ask of the growers of hardy plants of all kinds for the million for "Boy's Love," they would probably look amazed. Still more would it be the case were the query addressed to the rough, uncultured plant hawker, and it is morally certain that neither would comprehend what was required were the botanical appellation given. But "Old Man" is the vulgar term, and "Old Man" it will probably be for generations. The plant owes its popularity to its exceeding hardiness, for it has come through such a winter as the late one literally unhurt. Even were the foliage at all harmed, and it is so comparatively deciduous that there is little foliage to injure in the winter, it was but needful to cut back the top shoots, and in a few weeks the back buds burst, so that now the plants are tufts of the richest green, earliest amongst the early of deciduous shrubs in leaf. Then it has very pretty leafage also, which is of an exquisite green tint; and finally, it is of a sweet perfume. Somehow, plants which have a pleasant perfume never lose in popularity. Even now there is a big run on the "Old Man," and it is hard to keep pace with the demand. Some increase stock by cuttings, some by putting older stocks all topside, and dividing them—but propagated they must be plentifully Lavender, too, finds favour, especially the Lavender Cotton, but still, no perfumed shrubs of this class are in such demand as the Southernwood as a market-barrow plant, and immediately it will be found in vast quantities in all our London streets. *A. D.*

FRUIT JUDGING.—I would like to bring forward a grievance felt by numbers of exhibitors who show Melons, Apples, Pears, &c., of the common practice of judges to cut these fruits before making their awards. The object of an exhibition is to show; and what does the public generally care about flavour in what is shown? Now, while granting that high flavour in all kinds of fruits is of much importance, I do not attach the same weight, as some people do, in exhibited fruits. If the committees of societies are anxious to have flavour tested, then why not have a

Auriculas came from Mr. Douglas. Mr. Charles Turner was second. This class adds some extent to the show, but it invariably contains specimens inferior to those seen in the foregoing classes.

The alpines made a brave display, and those who complain of the sameness in character and formality of the show varieties turn with satisfaction to the brilliant and diversified alpines. The best twelve plants came from Mr. Charles Turner, Royal Nursery, Slough, who had a very fine lot of superbly grown and bloomed plants. The varieties were Harry Turner, Roland, Magnet, Sunrise, John Bright, T. E. Henwood, F. Knighton, Mungo McGeorge, Peter Flower, Phœbe, and Sensation. Mr. J. Douglas came second with some admirable specimens. With six varieties, Mr. T. E. Henwood was first with grand plants of Love Bird, Charles Turner, Mrs. Martin, Mary Frances, Defiance, and a seedling; second, Mr. C. Turner. Mr. George Wheelwright was third with capital specimens also. The best four came from Mr. Wheelwright, who had Hotspur, Pallas, Garnet, and Defiance; Mr. T. E. Henwood being second, Mr. W. L. Walker, also of Reading, third. In the class for single specimens of golden-centred alpine Auriculas, Mr. C. Turner was first with H. M. Pollett, Mr. T. E. Henwood second with Florie Henwood, Mr. A. J. Sanders third with Diadem, and Mr. Wheelwright fourth with Sunrise. In the class for white centres, Mr. C. Turner was first with Maud Fellowes, and second with Countess; Mr. T. E. Henwood third with Paragon, and Mr. J. J. Keen, Southampton, fourth with Edith.

Gold-laced Polyanthuses were shown in much better character than during the past few years. Mr. J. Douglas was first with well grown and bloomed plants of Cheshire Favourite, Exile, William IV., George IV., Lancer, and a seedling red ground. Second, Mr. J. Weston, gardener to Mr. D. Martineau, Clapham Park. Mr. R. Dean was third. Mr. J. Douglas also had the best three plants. Mr. A. J. Sanders was second, Mr. Weston coming third. The best single specimen was George IV., from Mr. J. Douglas. For twelve fancy Auriculas, Mr. J. Douglas was first and Mr. R. Dean second. Under this head can be grown anything that does not come into any of the divisions of the show Auricula. Among seedlings of the latter will come some edged flowers having a golden instead of a dark ground, and such types Mr. Douglas had in good character. Mr. R. Dean had some double and semi-double varieties and others of a mixed character. Fancy Polyanthuses were less attractive than usual, owing to the lateness of the season and the difficulty of getting the plants into bloom. Mr. J. Douglas was placed first and Mr. R. Dean second. In the class for hardy Primroses the positions of these two exhibitors were reversed, Mr. R. Dean showing a bright and effective lot, but wanting time in which to develop. In the open ground they are nearly a month later than nsual in blooming. Mr. J. Douglas was second, and Mr. O. T. Hodges, Lachine, Chislehurst, third. Messrs. Paul and Son, Old Nurseries, Cheshunt, were first for baskets of double Primroses; Mr. R. Dean was second, having the old velvet crimson and the blush. None of the doubles scarcely were well advanced in bloom, owing to the coldness of the weather. A very fine and interesting group of twelve species came from Mr. J. Douglas, and was awarded the first prize. It contained japonica, Auricula, cashmeriana, floribunda, verticillata, obconica, intermedia, Nelsoni, marginata, obtusæfolia, nivea, and rosea. Sir J. T. Llewelyn, Bart., Penllergare, Swansea, was second with a very good collection also. With six specimens, Mr. O. T. Hodges was first with denticulata, very fine; viscosa and its variety, purpurea, nivea, hirsuta, and marginata; second, the Guildford Hardy Plant Company, who set theirs up tastefully in a Moss-covered box. Noticeable in this collection was Balfouriana, with large, bright, claret-coloured flowers. Mr. R. Dean was third, having a finely-formed P. obconica and a pretty lilac-coloured form named Peyritschi. Messrs. Paul and Son were first, and Mr. R. Dean second, for baskets of Primroses.

Certificates of merit were given to the following new Auriculas: Mrs. Henwood, green edged, raised by Mr. Samuel Barlow, Manchester, a very finely-fringed variety of robust growth; exhibited by Mr. T. E. Henwood, of Reading. Certificates of merit were also awarded to the following alpines: Mrs. Walker, maroon, shaded with salmon-red, raised and exhibited by Mr. T. E. Henwood, of Reading; John Bright (Turner), dark ground, shaded with delicate orange-salmon, very fine, and Primrose Queen (Turner), dark ground, with rose shading paling to silvery-grey—both exhibited by Mr. Turner; Mrs. Douglas (Henwood), cream centre, with maroon ground, and edged with rose shading to silvery-pink—a very pretty and pleasing variety; and Mrs. Harry Turner (Turner), cream centre, black ground, shaded with delicate mauve.

The Auricula selected for the premier prize was grey edge George Lightbody, shown by Mr. T. E. Henwood in his first prize collection of twelve varieties.

OBITUARY.

WILLIAM BARRON.

We are very sorry to have to announce, at the advanced age of eighty-five, the death on the 8th of April of Mr. William Barron, of Borrowash, whose name was so well known among gardening people. He was born on the 7th of September, 1805, at Eccles, in Berwickshire, and having early shown a love for gardening, he went as an apprentice in the gardens of Lady Boswell, Blackadder. He afterwards went to the Botanic Gardens, Edinburgh, under Mr. William McNab. Here he remained for two years, and wishing to know something of Pine growing he was sent to Syon House. He was then appointed in 1830 to lay out the grounds at Elvaston Castle, Derbyshire, for Charles, the fourth Earl of Harrington, with whom he remained for over twenty years. During this period he began and completed one of the most curious gardens in Great Britain. All the finest specimens of Coniferæ, including many large old Yews, that could be obtained were brought to and planted at Elvaston. Shortly after the death of the fourth earl, Mr. Barron published a work under the title of "The British Winter Garden." Mr. Barron would not allow a second edition to be published until he had thoroughly revised the work, but unfortunately he was never able to do this. He was known not only as a landscape gardener, but as an authority on Conifers. Soon after the death of the fifth Earl of Harrington in 1862, Mr. Barron's nursery at Elvaston having largely increased, he bought about 40 acres at Borrowash, within a mile of Elvaston, and to this he gradually transferred his stock. His son having now joined him, he in 1865 resigned his appointment at Elvaston and went to reside at Borrowash. One of his greatest feats in tree moving was when he successfully removed the Buckland Yew, over 1000 years old. The last work he took any active part in was laying out the Abbey Park, Leicester. He was summoned as the first witness before the Royal Commission on Forestry in 1887. Up to the time of his death his faculties were unimpaired, with the exception of his wonderful memory, which somewhat failed him after a severe illness he had in the spring of 1890. He was one of the pioneers of the temperance cause at a time when it was more difficult to inculcate its doctrines than at the present day.

Mr. John Dykes.—Mr. John Dykes, nurseryman, expired at his residence, Dundonald Road, Kilmarnock, on Friday morning last, aged 80 years. He had been for a considerable time in infirm health. The deceased had for upwards of fifty years carried on his business as the successor of Dykes and Gentles. He was one of the most prominent authorities on agriculture in the west of Scotland, and was appointed a member of the committee of the agricultural section of the International Exhibition at Glasgow.

W. M'CORQUODALE.

Many of our readers, not only in this country, but in widely different parts of the world, will learn with deep regret of the death on the 17th April, at the age of eighty-one, of Mr. William M'Corquodale, forester to the Earl of Mansfield. He was a man who enjoyed the love and esteem of all who had the good fortune to be acquainted with him. As a forester he had acquired a European reputation. Until last spring Mr. M'Corquodale was in the enjoyment of excellent health, but at that time he suffered from the epidemic of influenza, and although he was able to resume his duties, he was never so robust as formerly, and towards the latter part of September he was entirely confined to the house as an acute sufferer with little hope of recovery. Mr. M'Corquodale was born in Argyleshire, and received part of his training at Stonefield. In 1838 he entered the service of the Earl of Mansfield, and for many years has been the acknowledged father of forestry in Britain. In May, 1880, he completed his fiftieth year as a practical forester, and on October 5 following, at the annual dinner of the Scottish Arboricultural Society, of which he was one of the original members and staunchest friends, he was the recipient of a valuable testimonial, consisting of a handsome gold watch and a purse of 100 sovereigns, with a brooch for Mrs. M'Corquodale. During the long period he has been connected with Lord Mansfield's estates he has planted and reared many thousands of acres of woodlands with the greatest success, thus not only enhancing the beauty of the landscape in what were formerly desolate portions of the county, but adding immensely to the value of the property. Oak, Larch, and Scotch Fir were the varieties which he most largely cultivated, but all other species and varieties of British timber have found a home under his care on the Scone estates. Still, it is as the pioneer planter of the newer Coniferæ on an extensive scale, as a regular forest crop, that Mr. M'Corquodale's name will be best known to future generations. When he first took charge of Scone woods, the taste for planting ornamental Conifers was just developing, fostered by the splendid introductions of Douglas (himself a native of Scone) and others from the north-western seaboard of America. Of these noble trees, Mr. M'Corquodale had the greatest faith in Abies Douglasi, which he regarded not only as a beautiful ornamental tree, but as a valuable timber tree as well. He commenced in 1857 by planting 13 acres of poor moorish soil with Douglas Fir, and he was so well pleased with the result, that in 1860 he planted several acres on Taymount Estate, alongside the Highland Railway between Stanley and Murthly, with Douglas Fir as a permanent crop. This is now a pure Douglas Fir plantation, and from its singular beauty readily attracts the attention of observant travellers. The success which so far crowned his efforts led him to extend his experiments at Lynedoch, Logiealmond, and Scone, with the most gratifying results.

He, happily, lived to see his early beliefs justified by results. These experiments brought him into notice not only all over Britain, but in various parts of Europe. From his extensive experience, Mr. M'Corquodale was frequently invited to act as a wood valuator and surveyor, and, through the kind indulgence of his noble employer, he was privileged to inspect and report upon the woods of a very large number of estates in Scotland and England, his opinions and recommendations being held in the highest estimation by landlords and others. Many of his most valuable contributions to forest literature appear in the "Transactions of the Scottish Arboricultural Society," from whose annual meetings he was only once or twice absent since the formation of the society in 1854, and in which he held various important offices. He is survived by a widow and a family of grown-up sons and daughters, for all of whom there will be widespread sympathy.—*Perthshire Constitutional.*

—which is very remarkable—while in the case of hybrids from these two parents the resulting bulbs often attain a circumference of six inches by the end of the first year. In order to obtain these results, it is, of course, necessary to keep the plants growing the whole of the time, and not to allow them the annual rest which they require when they are older. It is scarcely necessary to add that they must be kept under glass—at any rate during the colder months—but a high temperature is not advisable. There can be no

MR. JAMES BARSON.

doubt that the perpetual propagation by means of offsets or leaf-cuttings tends to produce the deterioration of the race, and, as the stock of many growers already shows signs of deterioration, it is to be hoped that seeds will be more largely used in the future than they have been in the past. There is, too, always the chance of securing new hybrids superior to either of the parents, and this alone should be an inducement to amateurs to try this method of propagation.

August 26th.—That plants are often starved is indisputable; but the possibility of their being overfed is apt to be overlooked. While one realises in a general way that it is possible to have too much of a good thing, there is generally a reluctance to apply the principle to specific cases. A plant, given a certain amount of manure, makes a remarkable advance, so more and more manure is given to it—with surprising results, for it turns sickly, and begins to go backward. This would not be likely to happen if one fact were borne in mind—that all plants consist of from seventy-five to ninety per cent. by weight of water. Obviously, then, the amount of solid matter which they can utilise is very small. It has been shown that if the amount in solution exceeds one part in five hundred parts of water, many plants are injured, being dwarfed in growth, while their leaves become yellow or twisted, and ultimately fall. Pot plants are more likely to suffer from these and similar causes than others growing in the open ground, because they cannot send their roots beyond their injurious surroundings. This is one more argument in favour of good drainage. When there are plenty of broken crocks at the bottom of a pot, watering will, in time, wash away the excess of soluble food, and so will relieve the roots. Of course, it cuts both ways. If there is a deficiency of soluble food, that also will be reduced by each watering.

H. C. DAVIDSON.

A HOLLYHOCK growing in a garden at New Cross is attracting a good deal of attention just now. It has three flowering stems, varying from eight to nearly twelve feet in height, thus eclipsing even the famous Cardiff plant, which has attained a height of eleven feet.

Famous Gardeners at Home.

No. 152.—MR. JAMES BARSON, AT THE GARDENS, HINCHINGBROOKE, HUNTINGDON.

IT was almost on the eve of the Huntingdon Horticultural show, in July, that I visited Hinchingbrooke, and preparations for the event were going on in the gardens, which Lord Sandwich kindly allows to be used for the purpose. Mr. Barson, the head gardener at Hinchingbrooke, is, of course, one of the moving spirits, as he is also one of the most successful of exhibitors at local and other shows. But he suggested that before we discussed either of these points we should look round the grounds, and, accordingly, we started at the fine old archway, which is one of the features of the place, passing on our way the commodious stables, with their window-boxes adorned with Pelargoniums.

In making restorations to the mansion, such as the repair of a window of 1602, care has been taken to preserve its ancient character. In that part of the pleasure grounds which can be best seen from the terrace opposite the mansion, beds containing standard Geraniums, Begonias, Aloysias, standard Fuchsias, and Dahlias are prominent, with two antique vases filled with scarlet Geraniums and Tagetes. Scarlet Geraniums are, in fact, a great feature, Lord Sandwich being very fond of them. But at this point we did not talk about varieties, proceeding instead to notice some of the fine timber which enhances the beauty of the pleasure grounds. There is a grand Cedar, with a trunk fourteen feet six inches round, twenty feet up, and more than a hundred and fifty years old, a very handsome Beech, and some nice specimens of Prunus Pissardi.

In the path leading to the woods, a fine old Box hedge, of considerable height, attracted my attention; and in the park, just beyond the gates, adjacent to the appropriately-named Walnut Walk, is the lake, with some of the best varieties of Marliac Lilies, which flower well, and are extremely ornamental. Coming back to the pleasure grounds, with a glance at another grand old Cedar, conspicuous for its striking quantity of bramble, we paused at the Cloisters, which form a portion of the mansion, and I said,

"I see that you have some Orange trees in tubs."

"Yes," rejoined Mr. Barson. "They came from the South of France, and have been here about six years. We take off the old fruit, and they seem all the better for it."

"Here, too, you have a number of Geraniums in tubs still thriving."

"A dozen. They are all Henry Jacoby, and have been in flower since Whitsuntide. They are very lasting, and cause very little trouble. We give them a small quantity of bonemeal twice a week. The pots which you see sunk into the lawn contain Ivy-leaf varieties, Madame Crousse, Ryecroft Glory, Charles Turner, and Splendens."

"With the Geraniums you mix Marguerites?"

"We like the combination. The Marguerites are also grown as single plants in tubs. They are taken from the beds, wintered in the tubs, and put out in April. The variety is Coronation."

"What do you grow in the winter garden?"

"The Clianthus puniceus is very beautiful when it is in flower. Other climbers are Plumbago capensis, Bougainvillea Sanderii, and Tacsonia exoniensis. We have Chrysanthemums here in the winter, and also the Palms."

"Your Honeysuckle arches are quite a feature."

"They are just beginning to look lovely. We only grow the old red variety; no other does so well here. The arches, some of which consist of Crimson and White Rambler Roses, were started eight or nine years ago. Honeysuckle also grows on the wall of the flower garden adjoining the mansion, as well as Clematis and Ampelopsis Veitchii."

"The wall is embellished by its battlements," I observed, as, after inspecting a noble Wellingtonia gigantea, and a number of good old Irish Yews, we strolled towards what is known as the flower garden. This contains a number of singularly effective beds, in which standard Geraniums are prominent.

HINCHINGBROOKE, HUNTINGDON, FROM THE GARDENS.

"The principal varieties," said Mr. Barson, "are Decorator, Golden Vesuvius, John Forbes, Dr. Nicaisse, Mrs. Marshall, King Edward the Seventh, and Athlete."

"How many vases of Geraniums are there on the top of the wall with arches leading out of the garden?"

"About a hundred. They are chiefly Jacoby, King Edward the Seventh, and Athlete. The wall itself is covered with Ivy and Clematis."

"I should like to have some particulars about the beds."

"One, as you see, is scarlet Begonias, carpeted with Alyssum and Mesembryanthemum, relieved with Acacia lophantha. There are two beds of light, dwarf Grass, also Eulalia japonica dotted with Lobelia cardinalis and standard Golden Privet in the centre. Then there are beds of white Marguerite dotted with scarlet Cannas, beds of bush Fuchsias, dotted with standards, and beds of Heliotrope with a standard in the centre and bushes at the bottom."

"Your plan is to dot the beds?"

"Yes, in this garden. Thus, the beds of Tagetes are dotted with the bronze Castor-oil plant, and those of the small Begonia Phosphorensis with Japanese Maize. Other beds, however, consist of one variety, such as Marigold, (Legion of Honour), Geraniums (Duchess of Cornwall), and blue Lobelias. There are two beds, under the wall, of Antirrhinums of mixed colours, and one of the Tobacco plants (affinis and sylvestris)."

There is another garden by which the tennis courts and croquet lawn are approached, and I inquired whether these had been made recently.

"Everything in the shape of improvements has been done during the last eighteen years, since the present Lord Nantwich came into possession of the estate."

"The pleasure grounds must be very considerable in extent?"

"They are about twenty acres, and the kitchen gardens about four acres and a half. Here you notice a good collection of flowering and other shrubs, including Lilacs, Syringas, standard Laburnums, Golden Elders, Berberis Darwinii, and double scarlet Thorns, while all round the tennis courts are climbing Roses, Clematis, and Honeysuckle on woodwork."

"The arrangement is very charming. But what is the garden we are now entering?"

"The Japanese garden. It was made three years ago, out of a dirty pond."

"How did you do it?"

"We drained the pond, made the watercourse, and took in another piece of the park where hundreds and hundreds of barrows of soil had collected. Of the last we made miniature mountains."

"Yes, I observe that you have the valley and the hills on either side."

"On one bank will be an avenue of Cryptomerias (Japanese Cedars) and Japonicas, which have already made marvellous growth."

"What have you planted on the hills?"

"Chiefly, Bamboo, Eulalia japonica, standard Wistarias, Rosa rugosa, clumps of Chrysanthemums, Azalea mollis, Aucuba japonica, Funkias, bush Wistarias, Golden Privets, Liliums Harrisoni, Browni, auratum, tigrinum splendens, masses of the old common Musk, and masses of Hyacinth candidums, clumps of Pampas Grass, standard Hydrangeas paniculata, standard Hibiscus, Magnolia stellata, Maples in pots sunk in the earth, and little Oaks in pots."

"We have, also," continued Mr. Barson, "worked Azaleas in trunks of trees from Yokohama. Some of the best varieties of Japanese Iris are still in flower. Aucubas, male and female, are planted together, with double Cherries (white and pink). Other varieties are the Japanese Larch, Pyrus japonica, large clumps of Spiræa japonica, Japanese Dianthus, Golden Hop, Japanese Myrtle in pots, Rheum giganteum, Hydrangeas, Hortensis, the Japanese Wineberry, Strawberry-Raspberry, and Mayberry."

"You have Lilies in the water."

"Lilies and goldfish. The bank in front of the tea-house is made up of stonework, flowers, and foliage."

"Did the seven storks come from Japan?"

"Yes, and also the two flying-fish. When the garden is illuminated we have a fire which is supposed to represent burning earth, and the effect is very realistic."

"How long did it take you to make the garden?"

"We commenced at the end of September, and finished at the end of April."

"Then you must have had a large staff engaged?"

"We had a number of extra men. Ordinarily, the strength of the garden staff is about fifteen, four of whom reside in the bothy."

Before we went into the kitchen garden we had a peep at the Chestnut Walk, and at forty-eight very fine-looking roots of Celery—Sutton's Silver White and Veitch's Red Perfection—for exhibition. Two years ago the south wall of the kitchen garden was planted, right away from the gate to the Park, with Roses, Teas, China, and Noisettes on one side, and Crimson Rambler on the other. The addition is delightful, and prepared me for the remarkably beautiful border of mixed annuals leading from the pleasure grounds and going far into the kitchen garden. I asked how it was mainly made up.

"There are Roses and Sweet Peas at the back, a hundred and fifty Dahlias of the best varieties in the border, which also includes batches of Coreopsis, Stocks, Godetias, Marigolds, Salpiglossis, batches of Asters, pale blue Larkspur, miniature Sunflowers, Nasturtiums in variety, golden Tagetes, purple, white, and pink Candytuft, and clumps of Heliotrope (Madame Buzzard). At the end, just outside, is a pergola of Wistaria, in the centre a bower covered by Crimson Rambler Roses, and at the other end Crimson Ramblers again."

"What is the length of the border?"

"Sixty yards, and it is five yards wide."

"Now, shall we take the frames and houses?"

"Of Cucumbers and Melons, the varieties are Lockie's Perfection, Rochford's Market, and Telegraph Cucumbers. The Melons are Hero of Lockinge and Earl's Favourite. Geraniums for exhibition are also grown in frames, including King of Denmark, Charles Page, and Queen of the Whites. In the cold frames we grow Carrots for exhibition, Veitch's Scarlet Model and Sutton's new Red Intermediate."

"Do you grow Chrysanthemums for exhibition?"

"No. We have about six hundred of the Japanese and Incurved, but we merely go in for the varieties which suit our purpose for decorating. Of Carnations we have a whole bed of Old Clove and Raby Castle."

"Your stove appears to be a new house?"

"It was put up eighteen months ago. There is a good selection of Crotons and other tall plants. The contents also include Tobacco plants, Allamandas, Hydrangea paniculata, Dracænas, standard Abutilons, and Bougainvilleas. The back wall is covered with Mosses and Ferns."

Entering one of the Vineries, some magnificent Liliums in pots caught my eye.

"They are L. Harrisii and L. auratums for exhibition," explained Mr. Barson, "also the standard Fuchsias, Daniel Lambert, Scarcity, and Lustre."

"How old is your rod of Madresfield Court?"

"Only five years. The other varieties of Grapes in this house are Duke of Buccleuch and Hamburgh. The varieties in the late Vinery are Muscat of Alexandria, Lady Downe's, Mrs. Pearson, Alicante, and Gros Maroc."

"And Peaches?"

"In the early house, Hale's Early, Early Beatrice, and Royal George. I had eighteen dozen fruits on one tree of the last. In another Peach house are Pitmaston Orange Nectarines. Outside I grow the Lord Palmerston Peaches, with others, which are shifted in afterwards. Crimson Galande was shifted from outside last September, and is doing well; also Elruge Nectarine."

"You have a good crop of Sea Eagle?"

"Also of Barrington. The Tomatoes in this house are Sutton's Exhibition, Webb's Coronation, Jubilee, Cannell's King, Perkins' Gem, and Brooks' Freedom. In the late Peach house are Barrington and Stirling Castle; and Nectarines, Violette Hative and Lord Napier. Here, too, we have Pears, Margaret Mochelle and Souvenir du Congrès; Plums, Transparent Gage and Kirke's; and Brown Turkey Fig. I am going to bring a Bellegarde Peach tree into this house."

"There remain the fruit and vegetables outside."

"We grow all the Lancashire prize Gooseberries. I think they are the best."

"Peas appear to be a great feature?"

"They are. Perkins' President, Edwin Beckett, Alderman, Duke of Albany, Sutton's Centenary, Carter's Telephone, Carter's Torpedo, Webb's Senator and Autocrat are among the best. All the ground on which the Peas are grown was trenched four feet in the autumn and manured twice. But it has had no water on it, nor been fed since."

"How many varieties of Potato do you go in for?"

"There are thirty-two on one patch, including Northern Star, Duke of York, and Cigarette. Onions do well with us. We grow some in pots and others in boxes. Those in pots are slightly better. Some of Sutton's Exhibition came to two and a-half pounds each. Of Parsley, which is specially good, we grow Webb's Curled. We have a patch of Seakale for taking up and growing in the house. By keeping this patch for three years, we get more to cut from than we do from the young plants. There are twelve Asparagus beds, twenty-five yards long."

"Do you grow several varieties of Strawberries?"

"Royal Sovereign, Laxton, Mentmore, Veitch's Prolific, President, Sir Joseph Paxton, and Latest of All. I prefer Raspberries grown on the wires to those bunched. Our two varieties are Superlative and Hornet. We also grow the Loganberry on wire; it is a good fruit for dessert."

"You have Apples on cordons and as standards?"

"Yes. Some of the best varieties of Apples are planted in the orchard, which we made about eight years ago. The best of the dessert varieties are Cox's Orange, Charles Ross, Rival, King of Pippins, Worcester Pearmain, Beauty of Bath, Allington Pippin, Lady Sudeley, and Gladstone. Here are twelve of the best kitchen sorts:—Peasgood's Nonsuch, Lane's Prince Albert, Warner's King, Ecklinville Seedling, Golden Spire, Wealthy, Gascoyne's Scarlet, Loddington, Pott's Seedling, Alfriston, Lord Derby, and Tyler's Kernel."

"What about Pears?"

"They do not thrive with us so much as Apples. The best are Beurré Superfin, Doyenné du Comice, Louise Bonne, and Conference. The Plums on pyramids are bearing splendid crops. The varieties are Gisbon's, Early Rivers', Victoria, and Washington. On the walls we grow Coe's Golden Drop, Monarch, Kirke's, Transparent Gage, and Jefferson."

"Now, about the show. How long has it been held?"

"This is only the second year. There are 1,500 entries. Vegetables are particularly strong all round. There is very keen competition, and a considerable sum is given in prizes. Lord Sandwich is both the president and the mainstay of the show. He started it."

"Are prizes awarded for stove and greenhouse plants?"

"Yes, for six varieties in foliage and bloom. Prizes are also given for three double and three single Zonal Pelargoniums, distinct; for three standard Fuchsias; for twelve distinct Tea Roses; for twelve bunches of hardy, herbaceous, and bulbous flowers; for collections of six different kinds of fruit; for Cucumbers; and for Potatoes. Messrs. Sutton, Messrs. Webb, and Mr. Perkins also offer prizes for six distinct kinds of Potatoes. The table decoration competition, open to ladies only, excites a great deal of interest."

"You show a good deal, I think?"

"Ever since I came here, five years ago, I have shown at local and other shows, Sandy, Burton, Ipswich, Woodbridge, Huntingdon, Ramsey, St.

Ives, Hitchin, and Cambridge. I have also lectured on horticulture for the County Council."

"How many prizes did you take last year?"

"Twenty-five firsts, two seconds, and one third, or twenty-eight out of twenty-nine exhibits. I showed groups of foliage plants, Fuchsias, greenhouse fruit, and vegetables."

"Where did you commence your gardening career?"

"Under my father, in Norfolk. He was head gardener for a quarter of a century at Garboldisham Manor. I then went to the Rayner's, Buckingham, Sir Philip Rose's place, and was there for three years and a-half; next I was for two years at Osberton Hall, Worksop, and, prior to my appointment here as head gardener, I was foreman for five years at Eastnor Castle, Ledbury."

Alfred Wilcox.

Letters from a Lady Gardener.

ABOUT WICHURIANA ROSES.

Dear Kate,—Have you seen the new Wichuriana Rose, Dorothy Perkins? It is one of the best possible climbers, for it is extremely floriferous, every point producing a spray of exquisite little Roses, in a rich, bright pink tint, which is very uncommon. We put in a plant of this Rose last autumn, and it has been greatly admired, for it is already more than half way up the arch it is to cover, and it has been a perfect mass of bloom for several weeks.

The Wichuriana Roses are very useful in many ways, for they will grow upwards or downwards, hanging low over a wall, or climbing up it; or you can make a fountain of flowers by growing them with very little support, when they throw up their long shoots from the base yearly, which take the most graceful curves in reaching the ground again.

Then they are so easily propagated by layering them, like a Carnation, after cutting the stem half through, and this is a good time for the work. You should mix some spent soil (turned out in repotting plants) with sand and charcoal dust, and put it into a small hole just at the place where you mean to layer the shoot of the Rose, then cut the stem half through, slanting the cut so as to make a tongue-shaped slit, and peg this down firmly, covering it with a little heap of the compost. You should not remove the young plants until the following October, when they should be strongly rooted.

Jersey Beauty is another good Wichuriana Rose, with creamy blossoms and abundant yellow anthers, for it is single. I like the foliage of these plants extremely; it is distinct from that of ordinary Roses, very neat in growth, small, and glossy; besides which most of them are evergreen, a great advantage in the winter. Jersey Beauty is thoroughly evergreen here, and its glossy leaves are lovely. Pink Roamer is a single flower with large clusters of bloom, but I don't like the shade of pink, which is too blue in tint, not a yellow pink, like that of Dorothy Perkins. However, the effect of the mass of little flowers, on an arch, if well away from scarlet flowers, is very bright, and those who are not so particular as to colours as I am will be pleased with it. There are a number of good hybrids of Wichuriana Roses (with larger varieties), just introduced, of which Edmond Proust, with copper-yellow double blooms, carmine-centred, is perhaps the best, but I have not yet seen it. Let me advise you to get two of these Roses in October, and if you have not room for them on an arch, plant them at the side of your lawn, in the sunshine, making a considerable hole for each, and laying the roots out horizontally in their natural position on fine soil. Don't add a lot of fresh manure to the soil when you plant them; if this is poor, have old manure dug into these places at once, when it will be right for the Roses at the end of October, or the first half of November; but if you can give them good, turfy loam, they will not require manure at present. Be sure to tread the roots in very firmly, and if the Roses are to cover an arch, tie them up to it before the wild winds of winter knock them about. Another important point is to see that the collar of the plant (*i.e.*, that point where the stem and the roots meet) is just covered with soil, and no more, for if it is uncovered the Rose will not thrive, and if it should be deeply placed below the surface, the same thing will occur. I saw a miserable Wichuriana Rose the other day, in a neighbour's garden, which was planted amongst a lot of young Fir trees, which, of course, exhausted the soil utterly, and the poor Rose was starving. When you put in a Rose or a shrub, I hope you will remember that it cannot possibly do well unless it is properly fed; all Roses (and especially climbers) must have a good mulch of manure every spring in March, when they start their growth after the winter's sleep, but they do not like their roots to touch anything of an impure nature, and, therefore, be careful to avoid this in planting them.

Dorothy Perkins.

Signs of autumn are beginning, and the berries of the Rowan tree (Pyrus aucuparia) are now lovely, like the brightest coral, all over the Rowan arch. I wish it were possible to keep some of them for winter decorations, but they are so easily broken from their stems that they fall in great numbers as soon as they are ripe. I have kept the beautiful triple pods of the dusky Iris, which grows abundantly in South Devon, by dipping them, before they are over-ripe, into strong, clear gum, when they last well through the winter, but Rowanberries are more difficult to manage, and you must gather them before they are quite ripe if you don't want them to fall off. The berries of the Japanese Rose (rugosa), and also of the Sweet Brier, Lucy Bertram (and others), are large and handsome; these should be gathered when scarlet, and dipped in strong gum, if you want them for winter decorations, and some of the prettiest to preserve in this way are Asparagus berries, for they are so light in effect for the dinner-table. Already the Virginian Creeper and Ampelopsis Veitchii are showing signs of brilliant autumn tints, and you can make a very effective dinner-table arrangement with their richly-coloured foliage, white Japanese Anemones, and the scarlet Asparagus sprays of berries. Japanese Anemones are so useful to cut now; ours have been left alone for some years, and have developed into large clumps, with hundreds of blooms. These plants take several years to get hold of the soil thoroughly, but when they do few perennials can be finer in effect. I have planted the new hybrid pink variety, Queen Charlotte, in front of the white Honorine Joubert, in a half-wild corner of the garden, where I expect it will be very effective in a year or two, for it has large, pale pink blossoms, semi-double, which, as they do not grow quite so tall as the white ones, they show up well in front of them. These Anemones are lovely in a rather shady corner, grouped with the larger British Ferns; both like to be left alone, and can be trusted to manage their own affairs when once well planted.

Wichuriana Rose—Jersey Beauty.

My shady corner is at the end of the lawn of which I sent you a photograph lately (August 6th), and we manage to make it very pretty with tall white and crimson Foxgloves, Canterbury Bells, etc., in spring, Hollyhocks later on, Japanese Anemones and Ferns, and, last of all, Red-hot Pokers (Kniphofias), but it does not do to forget to mulch these plants in spring, as they need plenty of good soil to make the fine growth which they should do.

In the conservatory the tuberous Begonias are still in fine blossom; these lovely flowers need to be often shifted on to a pot slightly larger than the last, and every time they are potted on they make fresh growth. In this way they can be induced to bloom till the end of October, when they go to rest for the winter, and should be kept dry and out of the way of frost until the middle of the following February, when a little syringing and sunshine will soon make them start, and we then pot up each tuber singly. The seed of double tuberous Begonias which we sowed in July has germinated perfectly, and the tiny plants must now be pricked out into boxes (see my letter of July 29th); we shall keep them growing as long as possible in winter, to give them time to form little tubers.

Your friend,

I.L.R.

Potatoes with haulm over six feet high have been grown this year by Mr. J. Hale, of Coombe Hay Park, Devonshire. The variety is not stated.

Collomia coccinea is a very pretty but little-known hardy annual, of the simplest culture. It is compact and bushy in growth, with neat heads of small, tubular blossoms of a soft salmony-red colour. It is perfectly hardy, and may be sown in the autumn.

not exist on the Continent, where many different kinds of fungi are eaten, and liked.

October 1st.—It would be interesting to ascertain, if it could be ascertained, what proportion of an ordinary man's knowledge he has personally tested, and what proportion he has taken upon trust. Life under modern conditions is so complicated that the former, as compared with the latter, must be almost infinitely little. The fact has its disadvantages, for it induces a habit of accepting without investigation statements which rest upon a very insecure basis. This applies, I think, especially to the domain of gardening. What our fathers thought and did, we are very apt to think and do unquestioningly. They, for example, talked glibly of the necessity of a thorough ripening of the wood if a fruit-crop was to be obtained in the following year; we do the same. Yet what is the evidence that such ripening is necessary? I don't say it isn't; I only ask for the evidence. Someone says, "But, really! Experience shows——" Just so. That was the evidence brought to prove the sun goes round the earth. We want something a little more definite—something more on the lines of the reply made by the Cambridge undergraduate, who, on being remonstrated with for saying that the distance from Dan to Beersheba was a Sabbath day's journey, staggered the examiner with, "But, my dear sir, I've walked it myself." This, if it had been true, would have been good evidence as far as it went. After all, one of the best tests for a supposed fact is whether there is a good reason for it or not. And here a possible reason does suggest itself. For it can be proved experimentally—by root-pruning, for example—that a check to the flow of sap promotes the formation of fruit-buds, and this flow would necessarily be less rapid through ripened wood than it would where the cell-walls were softer and more porous. But this by no means covers the whole ground. It is conceivable that in a full-grown tree the sap might be controlled by other agencies, quite enough to be independent of the amount of sunshine which at present we consider necessary. Here is a case in point. We have never had a worse autumn for ripening the wood, yet there are as many fruit-buds on my trees as I have ever seen on them. I could multiply instances, but, perhaps, have said enough to suggest further inquiry.

October 2nd.—"Plant trees at Michaelmas and command them to grow; plant them at Candlemas and entreat them to grow." This old saying, at any rate, has been pretty well tested. There can be no question that trees planted early in autumn, before root-action has quite ceased—and here we get the reason—are far more likely to grow and thrive than those planted some months later.

October 3rd.—The mosquitoes have been so excessively troublesome that I am anxious, if possible, to keep them away another year. There are about the place two ponds and several large open tanks, in which, no doubt, they breed. If the water is covered with a thin film of paraffin, as has been done with success in some mosquito-infested districts abroad, the pests ought to be destroyed. The difficulty is that the water is used for garden purposes. Can it be so used, when there is an oily film upon it, without injuring the plants? I can only try.

H. C. Davidson.

(To be continued.)

Mr. A. C. Bartlett.

FAMOUS GARDENERS AT HOME.

No. 105.—Mr. A. C. BARTLETT, at THE GARDENS, PENCARROW, CORNWALL.

To horticulturists the gardens at Pencarrow are so varied and beautiful as to amply repay them for a journey to North Cornwall. By the courtesy of Mrs. Ford, the owner of the Pencarrow estate, who herself takes the utmost personal interest, not only in the gardens generally, but in individual plants and Conifers, I had the privilege of spending a day in the grounds and houses, under the guidance of Mr. A. C. Bartlett, who is responsible for their well-being. In spite of the fact that rain fell steadily, we were able to have a good look round. The lovely drive from the lodge gates, a mile and a quarter long, is noteworthy for its wonderful trees, and the remains of an old British camp, from which, Mr. Bartlett explained, the place itself derives its name, meaning "Head of the Camps." There are a series of these ancient camps in North Cornwall, and of these the Pencarrow example was the chief, or head. As I remarked on some of the fine Conifers we passed, Mr. Bartlett said:—

"There are considerably more than a hundred species and varieties represented here."

"I should like the names of some of the best specimens?"

"There is one very fine specimen of Abies cephalonia, and another of Abies nobilis. We are famous for our wonderful collection of Picea morinda (the Weeping Tree of Nepaul). A somewhat rare specimen is a variety of Pinus insignis, called ladiata, which differs from the type in being more flat at the top, with more spreading branches, and bearing a smaller cone. Equally rare, perhaps, is the specimen of Cupressus torulosa majestica. Abies firma is a fine tree; its cinnamon bark is very distinctive. We also have some fine specimens of Cryptomeria japonica; this is a most interesting tree. According to scientists, this, Gingo biloba (the Maidenhair Tree), Tree Ferns, Equisetums, and mosses, were the chief vegetation of our country in Eocene times, so that we now grow and prize, as an exotic, what once was indigenous, and (who knows?) the very coal we are burning may possibly be Cryptomerias in another form. The varieties of Larix include Americana and Europa pendula. One of the trees which the late Sir William Molesworth set great store by was the specimen of Fitzroya Patagonica, which is the finest of that species in the country."

"Do you know when it was planted?"

"It was bought and planted by Sir William in 1849, when he made the gardens. The house dates from early in the fifteenth century, and the estate has belonged to the family for generations. But Sir William designed and laid out the flower gardens, made the rockery, and planted all the trees. He tried all sorts of varieties, and many failed, but others were found suitable to

Pencarrow, Cornwall.

the climate. Among the finer specimens, that of Taxodium distichum pendula is unequalled, and the variety of Douglas Fir called laxifolia is very striking. A tree, not a Conifer, which we prize considerably, is a very fine-shaped specimen of Ilex dipyrena, the Himalayan Holly."

"You have splendid specimens on the lawns."

"Yes; one of the best is the Pinus insignis, a spreading tree, standing well; Picea Menziesii is very fine, and another, the fine Araucaria, which is coning very freely. From one point we counted a hundred and fourteen cones."

"Is it your experience that it is customary for Araucarias to cone?"

"Although it is commonly considered unusual, it is quite an ordinary occurrence, both here and in many other places. Next year's cones and catkins are just making their appearance now. The Araucaria, commonly styled 'Monkey Puzzle,' is most unsuitable for a small garden, and should always be planted where there is plenty of space."

"By the way," continued Mr. Bartlett, "the name of 'Monkey Puzzle' originated here. The tree next the rockery was brought to Pencarrow soon after its introduction into the country by Sir William Molesworth, who paid twenty guineas for it. At the time there was a large house party, and all the visitors came out in solemn state to see this rare tree, as it was then, planted; and Charles Austin, the famous barrister, ill-advisedly touched the prickly leaves and sharply withdrew his hand, feelingly remarking, 'It would puzzle a monkey.' The name 'caught on,' and the tree is now more generally known as the 'Monkey Puzzle' than by its proper name of Araucaria imbricata."

"You have also a fine collection of Retinosporas on the lawn."

"Yes; Retinospora filifera, with its slender, pendulous branches, is a very graceful tree. R. ericoides is noteworthy, as also is the silvery R. squarrosa. The Retinosporas are as suitable for small gardens, because of their size, as 'Monkey Puzzle' is unsuitable. Another very suitable tree for a small garden is the Umbrella Pine of Japan, Sciadopitys verticillata, which is ornamental, and does not take up too much space. It cones in its young state, and the cones should be removed. Unless they are removed their weight is sure to ultimately kill the specimen. Cunninghamia sinensis makes a fine tree here, but it is too tender for anywhere in the North."

"As Conifers are such a striking feature at Pencarrow, and thrive so amazingly, I should be glad of any advice from you."

"Conifers are mostly surface-rooters, and quick growers, so that after a score of years or so they have practically exhausted all available sources of nourishment. Then the trees greatly benefit by annual top-dressing; probably, road-soil is the best material for the purpose; the refuse from the potting-sheds is also useful. But I must warn your readers against the use of manure, natural or artificial, for this purpose, except, perhaps, in very slight quantities."

"Can you suggest any special precautions in planting?"

"In most cases it is desirable to plant Conifers on a slight mound, and always keep the 'crown' up. Be sure that the roots are thoroughly moist—neglect of this is fatal to the well-being of any tree. Remove with a clean upward cut any damaged roots; lay out the roots carefully, and as straight as possible; cover them with fine soil, plant firmly, and stake carefully."

"What is the extent of your perfectly-kept lawns?"

"They exceed eight acres. All the mowing is done with hand machines, which entails a deal of labour."

"And the flower garden?"

"Just over two acres. As you see, the flower garden is in the form of a large, sunken panel, with a large fountain and fish-basin, with Water Lilies (Marliac hybrids, chiefly), in the centre. Also in the centre is the sweet-scented Cape Pondweed."

"Lobelias seem to be popular?"

"We think that the Lobelia cardinalis Firefly, associated in two beds with the pink Ivy-leaved Geranium, edged with Gazania splendens, forms a striking feature. There are eight beds with the Lobelias as dot plants, the groundwork of the beds being the dwarf African Marigold—Legion d' Honneur."

"Close to the mansion, and on either side, I notice you have beds of Heliotropes."

"These beds have been filled with Heliotropes ever since the gardens were made, with a white Datura in the centre of each. Heliotropes were favourites with Sir William Molesworth, chiefly owing to the perfume, and Mrs. Ford likes the order to be maintained. Opposite the doorway, on each side of the gravel path, are beds of tuberous Begonias—the best of all bedding plants—and dot plants of Eucalyptus cordata."

"You have also two nice beds of the fibrous-rooted Begonias."

"They alternate with the striped Chlorophytum and dot plants of red and yellow Abutilons. Two other beds consist of Cannas and the Narcissus Gladiolus. The latter are gigantic

Erica hyemalis.

flowers. Quite as showy as these are the two beds of Rudbeckia Newmanni, and in the beds under the windows are some fine specimens of Dracæna australis."

"You have not mentioned the display of Calceolarias, the soft yellow variety, which I observed directly we got to the flower garden."

"I am glad you admire them. It is the variety amplexicaule, and edged, as they are, with the bronze variety, and alternated in two of the four beds with the old purple Verbena venosa—which is coming into fashion again—they are very effective. Calceolaria amplexicaule is superior to the Golden Gem, which is usually grown, as it flowers until late in the autumn, and until the frost comes. With regard to culture, when once you get it you should strike your own cuttings. The beds of foliage in the middle of the flower garden are filled with the Castor-oil Gibsonii and Iresines in variety."

"Then there are the gorgeous beds of Dahlias, close by. What are the varieties?"

"The Rising Sun, the dwarfest of all—only eighteen inches high—is the best of all bedding Dahlias. It is worthy of much larger cultivation, as it flowers freely from July until the frost comes. In these beds are also a few of King of the Cactus, the biggest-flowering Cactus Dahlia there is. In the two large mixed beds there are Golden Rod, single Sunflowers, Cactus Dahlias in variety, Stocks, Asters, the Autumn Crocus (Colchicum), herbaceous Phloxes, and Nicotiana sylvestris, which opens in the daytime, and the African variety, which opens only in the night."

"Have you any idea how many plants you use for summer-bedding?"

"About twelve thousand. Every variety is selected with the view of having it at its best from July onwards, when Mrs. Ford is in residence. Mrs. Ford prefers to have the show of flowers in the garden rather than in the house. The principle is to get a great quantity of plants in a little space. We are now preparing the plans for next year, in order that we may have ample time to get out the stock."

Having paused a moment to look at two fine, old-fashioned Fuchsias, fulgens and corymbiflora, in beds with scarlet Geraniums (the Aurora Borealis variety), we proceeded to the rockery.

"Where," I enquired, "did you get the enormous boulders which constitute the rockery?"

"At Bodmin moors, twelve miles distant. Between forty and fifty carts were employed at the same time in bringing them. Sir William Molesworth's tenants assisted for weeks after hay and corn harvest; and Sir William himself superintended the placing of each stone. He studied the natural formations before starting."

"Where was the cross in the top corner obtained?"

"That is an old Cornish cross, and it was buried for centuries in a farm hedge, and lately brought to light. Its diameter is two feet ten inches, which gives some idea of the size of the boulders themselves. The rockery, which is a hundred and forty yards long and twenty-six feet high in the centre, was, of course, built before rock plants were in vogue, and is quite different from the modern kind."

"What should you say are the leading features?"

"Himalayan Rhododendrons, Gaultheria Shallon, Andromeda floribunda, and other varieties, Cotoneasters, Yuccas, which stand out boldly, Camellias, of which the best for outdoor culture are C. reticulata and C. Lavinia Maggii, Heaths in variety, especially Erica Mediterranean and Erica compacta, Daboecia polifolia, scarlet Fuchsias, and hardy Ferns in abundance, some very rare. Along the banks of the stream near by are Bamboos, and Gunnera manicata, with leaves more than ten feet across."

"You have another variety?"

"Yes, Gunnera scabra, which has pink ribs to the leaves, while manicata has white ones. Scabra comes from Juan Fernandez, and it was from this plant that Robinson Crusoe took water when he was almost dying with thirst. It had collected in the gigantic leaves, which he also employed for roofing his hut, and for domestic utensils. Here, too, are noble clumps of the Osmunda regalis (the Royal Fern), the Bulrush, with brown flowers, an enormous Copper Beech, masses of the Himalayan Balsam, two big Palms, twelve to fourteen feet high, in an old house, once the home of aquatic fowl."

"How long have they been there?"

"Three years. They were planted out from the conservatory, and are now thoroughly established. To prevent them from being blown over by the wind, I placed large slabs of stone over their roots after they were planted, and when they were rooted in the soil I took the slabs away."

Before we arrived at the American garden we passed two ponds with Arum and Water Lilies growing in them, while on the banks were Bamboos, a fine specimen of the Silver Weeping Willow, and also one of the Sugar Maple, Acer saccharinum."

"You have Azaleas in the American garden?" I observed.

"Notably Azalea indica, which usually grows in the house, but flourishes here in the open. Rhododendrons and Camellias thrive in this garden, and Fuchsias and Ferns on the banks of the stream. The purple and yellow Loosestrife flourish, and there are some fine specimens of Conifers dotted about. The Oak trees, with Ferns growing on them, thirty to forty feet from the ground, are very interesting."

"Your shrubbery includes some masses of Hydrangeas, both pink and blue. What is your view as to the cause of the difference of colour?"

"It is entirely a question of light. Where the flowers are fully exposed to the sunlight they are pink—the normal colour—and where they grow in the shade the colour is blue; if in partial shade you notice a reddish tint in the blue. In proof of this theory, I may say that there are no blue Hydrangeas in a glasshouse, unless they are in a shady corner where the light does not penetrate."

From the shrubbery we made our way into the houses. The Water Lily house is the first of an extensive range.

"There are no pots in it," I remarked.

"No; that is a point. I re-arranged this house, and I had everything planted out. The varieties of Lilies in the tank are Dauberryana (blue), stellata (blue), dentata (white), Ortigiesii (red), and Devoniensis (red). In the tank is the Sacred Bean of Egypt, and at the end of the house, attached to a tree stump, is the tropical climber, Monstero deliciosa. In the photograph you can see the four fruits of it. Entwined amongst its leaves is the Hoya carnosa, which flowers early in the spring, and again in the autumn. The flowers in the spring should never be cut, or you lose the autumn ones. The roof plants include Bougainvillea glabra, Gloriosa superba (scarlet and yellow), Allamanda Schottii, a number of tropical Gourds, including Momocordica and the curious snake-shaped variety, and the Luffa Egyptiaca, which is used as a sponge."

"Which do you consider the features of the stove?"

"The Anthuriums are rather fine, and there are two big pots of Eucharis, as well as Crotons and Dracænas in variety. Behind the stove is a bit of tropical rockery."

"I should like the names of some of your varieties of late Grapes?"

"Appley Towers, West St. Peter's, Lady Downe, Black Alicante, Lady Hutt, and Mrs. Pearson."

Next to this Vinery is the conservatory, which was bright with many flowers, and Mr. Bartlett pointed out, on the roof, Tecomas in variety, particularly T. grandiflora, with enormous brick-red flowers, the new Honeysuckle, Lonicera Hildebrandii, the golden Cestrum aurantiacum, now flowering for the second time this year, and the sweet-scented Rhyncospermum jasminoides. Arranged up the pillars were Begonias fuchsioides and B. Knowlesiana; while in season there are in the house such plants as Francoa ramosa, Salvias splendens and Betholi, Begonia Weltoniensis, double Balsam, with many others.

In an adjoining house, devoted to Coleus, and containing fine varieties of colour, I inquired if they are easy to raise.

"Quite easy," rejoined Mr. Bartlett. "The seed should be sown early in the spring, in heat, to produce nice plants in the summer. A beautiful variety can be got from one packet of seed. Coleus require generous treatment and full exposure to the sun, to bring out the colour."

"Do you go in for Orchids?"

"Our Lapageria house was Sir William Molesworth's first Orchid house. He was devoted to Orchids, and used to pot them himself. But they are not grown now. It is a remarkable coincidence that Sir William, who was the first Colonial Secretary, had a notable collection of Orchids; and Mr. Chamberlain, the late Secretary to the Colonies, is, as everyone knows, very strong on Orchids. The Lapageria rosea on the roof, the Maidenhair Ferns, and the standard Geraniums are the features of this house. The next is the Fuchsia house, and also contains Geraniums. The varieties of the Fuchsias include Phenomenal, Phenomenal White, Phenomenal Rose, Earl of Beaconsfield, Rose of Castile (one of the best), and Beauty of Exeter. The well-known F. V. Raspail is one of the brightest of the Geraniums. There is also a house devoted to Camellias, and in the kitchen garden there are two large Vineries in which Black Hamburgh and Muscats are grown; a Cucumber house, heated pits for Melon-growing and forcing Beans in the spring; and three long rows of Potato pits, which are also used for growing early Turnips, Carrots, Radishes, etc."

"How large is the kitchen garden?"

"Four acres. On one wall there is a fine old Pomegranate, which was planted when the gardens were made. The Peaches on the walls include Waterloo, Early Beatrice, Sea Eagle, and Golden Eagle. The last two do extremely well in Cornwall. On the north wall Morella Cherries are grown. Figs flourish on trees, and, as to vegetables, the garden is noted for fine Celery, Leeks, and Lettuces. We have had good crops of Peas and Beans. Strawberries have

Epacris Delicata.

been a grand crop. The kinds which do best here are Royal Sovereign, President, and Waterloo—the last-named is a magnificent late kind. But to get good fruits on our light soil the beds must be renewed every three years."

"You have a nice garden facing your own pleasant house."

"Yes; my quarters are very comfortable. The herbaceous border contains the usual varieties, and borders of the lawn facing the windows are of flowering Veronicas. I am making a collection of all the Cornish Ferns I can find."

"Finally, as to your own experiences?"

"I have been at Pencarrow for five years. I started under my father, who was gardener and bailiff for Lady Hotham, at Knightleys, Exeter. I was three years at Parker's Well, Exeter, under Mr. Rowland, a well-known exhibitor. Then I went to Dropmore, where I remained seven years, chiefly as foreman, and I am greatly indebted to Mr. Herrin for all I learnt from him. I next went to Kew for two years, most of which I spent in the hospital houses and the house for tropical bulbs. At Kew I was under Mr. Watson. On leaving Kew, I had a season at Finsbury Park, North London, to gain an insight into that branch of gardening."

Alfred Wilcox.

LETTERS FROM A LADY GARDENER.

No. 62.—OVERCROWDING.—VIOLETS AND HEATHS.

Dear Kate,—You say you have taken my advice, and potted up your half-hardy plants, and now your greenhouse is so full that you don't know what to do! Well, that is a misfortune which can be remedied without much difficulty, but overcrowding is so bad for plants that some of them must be removed, or all will suffer.

Some of the hardiest plants will survive in a frame if the glass is well covered with mats on frosty nights; but you will have to keep a sharp look-out for fading leaves, and cut them off at once, or the plants will suffer badly from mildew. Plenty of air, too, must be given to the frame in mild weather, but heavy rain should not enter it, and the best way to give air in wet weather is to raise the lights on a stone (or a small pot) on the upper edge of the frame. Then a few plants may do well in the cellar, if it be frost-proof. These are Dahlias, Salvia patens, Cannas, Fuchsias, and large plants of Brugmansia suaveolens (Datura), and of Hedychium Gardnerianum, which take up a lot of room in a small place. Scarlet Geraniums will winter well in a kitchen window, for they enjoy a dry, warm air, and generally die from mildew in a cellar; Phyllocacti can be kept safely in any frost-proof place in the house—in fact, they do much better when allowed to become quite dry, and kept very cool in the winter, than if they have much fire-heat. If you are not quite sure which of your plants are hardy enough for a frame in winter, I advise you to keep a few of the best specimens of each in the greenhouse, and only risk the others in a frame. Calceolarias, Cinerarias, Myrtles, Roses, Carnations, and Spiræas will all stand a good deal of cold, however, though of course they will not bloom so early as if kept in the greenhouse.

By the time you have sorted out all these plants, I think you will find plenty of room left for the rest; but none of them should quite touch its neighbours. When the Chrysanthemums are over you can cut them down, and put them in the frame, bringing in, at the same time, such of the other plants as are likely to flower, or need more warmth.

Our Violets are already in bloom, the Neapolitans being the earliest to open their buds, with Marie Louise, de Parme, and the double white Comte di Brazza to follow. We are potting up a few of the strongest clumps for the glass porch, where they do better than in a warm conservatory, as fire-heat soon injures them. But they must not be over-watered, and every failing leaf is cut off with the scissors (not dragged off, mind), for fear of mildew setting in, as this is fatal to success. They should be kept near the glass, and have all the sunshine they can get, with tepid water only when really dry, and plenty of air; then they give the sweetest welcome to our friends as they stand at the door. The Violets out of doors are now covered with a frame. We make a fresh bed, just the size of the frame, every year in April; then it is easy to have the frame (which has been used for Melons) lifted over the Violets at this time, cutting away the edges of the borders so as to bring the glass within six inches of the flowers. This plan saves the work of preparing frames for the Violets, and also saves the plants the check of transplanting; and we find it answers well, for we cut plenty of Violets all the winter. Princess of Wales Violet, treated in this way, produces enormous and very fragrant blooms; we have just top-dressed the plants with a mixture of loam, leaf-mould, dry cow-manure, and soot, and the toad (which we keep, usually, in the Vineries) is now paying a visit to the Violet frame, where he will make a clearance of all the slugs, wood-lice, etc. He is very tame, and we indulge him with a shower-bath of tepid water

J. Barton

AN ITALIAN GARDEN IN LONDON, AT THE HILL, HAMPSTEAD HEATH.

THE garden of Sir W. H. Lever, Bart., at The Hill, was designed by Mr. T. H. Mawson, of Conduit Street and Lancaster, and is quite unique. It is an Italian garden in London, on a scale of great splendour. By the courtesy of the owner, I had the opportunity of seeing it since the completion of an extension, which has materially augmented its beauty. Mr. J. Barton, who is in charge of the garden, and, under the direction of Sir William and Mr. T. H. Mawson has done a great deal towards rendering it attractive, showed me round, and afforded me the fullest information. The garden consists of a succession of terraces, planned with consummate skill, carried out with brilliant success, and decorated, at every point, with remarkable taste. These are all at the garden front of the handsome mansion on the slopes of the Heath, and the moment the lounge outside is reached, it becomes possible to appreciate the wonderful results which have been achieved by a combination of generous expenditure and artistic gifts.

AN ITALIAN GARDEN IN LONDON.—A VIEW FROM THE LOUNGE AT THE HILL, HAMPSTEAD HEATH.

THE LOUNGE AND LOGGIAS.

The lounge itself runs the whole length of the mansion, one hundred and thirty yards, and has a loggia at each end, one in front of the billiard room, which is in the shade when the other, in front of the music room, is bathed in sunshine. The columns in the lounge, which, like the garden, faces west, are all in one piece of stone, and are decorated with various evergreen and deciduous climbing plants, with Hops hanging over the roof, which have stood the heat better than anything else tried, while suspended from the roof are several hanging baskets filled with flowers of one colour, according to the season. The lounge, which is wide enough to use for dining purposes, is adorned outside and inside with climbers, chiefly Roses, but nothing half-hardy, because the position is too cold for half-hardy subjects to flourish. Just in front of the billiard room is a fine bed filled with Rose Killarney; though look which way you may from the top terrace, there are masses of colour to be seen. I commented on this result to Mr. Barton, and he rejoined that it was maintained all the year round, more or less.

"One of our main objects is to keep the garden bright through all the changing seasons. For example, in the central walk, the beds now full of Wallflower Vulcan will be a mass of yellow Calceolarias and Tropæolums; and the beds above, now devoted to Wallflower Belvoir Castle, will be occupied by pink Ivy-leaved Geranium Madame Crousse. Last year we had scarlet Paul Crampel after yellow. Wherever we can we observe this principle; and the Look-out, with figures on each column, is smothered in blue by the blooms of Ceanothus divaricata."

THE NEW DORIC STRUCTURE.

"Tell me, please, as we proceed, what you consider the most notable features."

"Perhaps we had better proceed at once to the new feature, and inspect the others on our return.

"During the winter," continued Mr. Barton, "an army of men were employed in converting some old stables into a fine Doric structure, which we call the pergola extension. It is three hundred and sixty feet long, with a rotunda in the centre, and a garden-house at the end. In order to secure privacy, there are patent blinds in the garden-house, which is panelled in English Oak, and you can see all that is going on outside without being seen. The creepers on it are limited to three varieties, which do not cling to the dresses of the ladies. They are Clematis Belle of Woking, a Patens type; Lonicera aurea reticulata, a golden vein on a

Digitized by Google
Original from CORNELL UNIVERSITY

green leaf, oval in shape; and Wistaria brachybotrys. The creepers help to form a screen without excluding the light. The same may be said of the row of golden Elms below the steps."

"But the Roses are the glory of the pergola?"

"Quite so. There are no fewer than fifty varieties of Rambler and pillar Roses, including all the newest. Every other single column is decorated with Roses, and where the double columns are, there are red varieties at one end and pink at the other. For the trelliswork, where I needed a big spread, I put Ramblers, and for the columns, the pillar varieties. Right through the pergola there is a line of Roses, all of one colour. The idea is not to fuse colours, but to centralise them. Thus, we get four reds, four pinks, four yellows, and four whites in succession, not either of them together."

"When were the Roses planted?"

"We only finished planting in April, and on May 9th, Captain Hayward began to show flower. It is a very strong grower."

ROSES FOR PERGOLAS.

"Of course, you have chosen varieties specially adapted for the purpose of a covered pergola, and I think that in the circumstances it would be interesting to give their names."

A VETERAN CHESTNUT TREE.

This fine old Chestnut, which looks like a number of trees, is on the lawn at Langley House, Abbot's Langley. It measures 36 yards through.

"American Pillar, Barbetta, Coronation, Ethel, Excelsa, Klondyke, Liberty, Tea Rambler, Rene Andre, Ards Rambler, Ards Rover, Climbing Captain Christy, J. B. Clarke, Captain Hayward, Frau Karl Druschki, Victor Verdier, Bouquet d'Or, Caroline Testout, Mrs. W. J. Grant, and Gloire de Dijon; Madame Alfred Carriere, Longworth Rambler, Ariel, Blush Rambler, Christian Curle, Crimson Rambler, Delight, Dorothy Perkins, Flower of Fairfield, Hiawatha, Lady Gay, Lady Godiva, Minnehaha, Mrs. F. W. Flight, Mrs. O. G. Orpen, Paul's Carmine Pillar, Philadelphia, Purple East, The Lion, The Wallflower, and Tausendschon. In most cases a couple of these, but sometimes four, have been planted. In a pocket to hide a back wall, are half a dozen standards, each of Dorothy Perkins and Caroline Testout, another mass of pink."

THE INTERPERSED CLIMBERS.

"Then there are the climbers, which are interspersed amongst the Roses?"

"Wistarias are one of the most important, and are represented by eight varieties. Of Loniceras there are five; of Ceanothus four; and of Jasminum three. Next to Roses there are the most of Clematis, the varieties being Earl of Beaconsfield, Gipsy Queen, Jackmannii, Jackmanii superba, Lady Bovill, Madame Grange, Madame Baron Vellard, magnifica, Othello, Red Jackmannii, Snow White Jackmannii, Calyxena, three varieties of montana, Lord Londesborough, and Belle of Woking. There are two varieties of Ampelopsis, three of Bignonia, seven of Ivy, three Passiflora, and other varieties are Bridgeria spicata and Polygonum Baldschuanicum."

"What is the width of the pergola?"

"Eighteen feet, and there are seats at intervals of five yards. There are three hundred and sixty columns, and forty-two pilasters, so that you may imagine it took some time to decide upon the varieties. If all the columns were laid down, they would reach a mile in length, as the total length of all the pergolas is two hundred and sixty-seven yards. With regard to Roses, the real art in growing them is to half-reveal and half-conceal, and they have all been planted with that object in view."

"I notice that the roof of the rotunda is made of copper?"

THE ORIGINAL PERGOLA.

"Yes, and seen from the outside it is very fine. The bronze lamp in the rotunda is of great age. Surrounding the bridge, which runs over a public roadway, are Elms, edible Chestnuts, and Beeches, and the recesses in the lower part will later on be smothered with pink Rambler Roses. You will now have an opportunity of comparing this pergola with the original, which prompted Sir William Lever to erect a second one. In this pergola you can also see what the other will be like at the end of three years. There is one important difference, the pagoda in the centre of the original pergola has been omitted in the new one, with the idea of obtaining a better light."

"Are the varieties much the same as in the extension?"

"They are very similar. The pagoda itself is decorated with Wistaria sinensis and Clematis Jackmannii, Clematis montana alba, Roses Dorothy Perkins and Crimson Rambler. Under each dome is a hanging basket filled with scarlet Geraniums."

"Much as I admire the pergolas, it is a pleasant change to survey your series of enchanting lawns. How do you keep them in such perfect condition?"

"With a motor. No pains are spared to keep the lawns as you see them, and the various expanses of green are always very much appreciated by visitors. The effect is heightened by the pavement, which is all in Portland stone to a design."

DAHLIAS RETARDED.

"It must tax your resources to fill the border which runs the whole length of your original pergola, its only break being the bank of Roses on either side of the entrance to the pergola?"

"After Wallflowers, and May-flowering Darwin and Parrot Tulips, we follow on with Liliums in variety, Pyrethrums, Spiræas, Irises in great variety, including Spanish and Italian, Tritomas, Border Carnations, perennial Poppies, and Delphiniums, of which I have raised many seedlings—in fact, most of the plants in this border are grown from seed. In November, Chrysanthemums are conspicuous in the border. These, with Dahlias and Sweet Peas, are arranged in groups. We keep Dahlias back by plunging them in pots. This does not, however, retard their growth when the time comes to transplant them. We go in for the best Sweet Peas, but they are grown, like everything else, for decorative purposes."

"Are the Lilies in the Lily basin named?"

"No, but they flower very nicely, and with the goldfish in the water make a show. In the centre of the basin is a fountain representing a dolphin, and in each corner of the design are Japanese Acers, of which the reflection in the water is rather fascinating. The Acers just here are a striking contrast to the green trees above and below them.

"Another of the borders," continued Mr. Barton, "now filled with blue and white Hyacinths and London Pride coming out, will later contain the scarlet Geraniums, and you will observe that for the trees round which the grass will not grow, we have planted Ivy."

"We must not forget to mention the arbour, which forms another very fine feature of the gardens, with its statues on either side?"

"It was made by the Gardens Crafts, Ltd., and is of frail material. It is therefore necessary that heavy plants should not be used for the purpose of covering it, and we find that Honeysuckle and Clematis Lord Londesborough, being frail plants, suit the purpose excellently. On each of the steps down to the original pergola is a mass of pink Roses, and in the bottom border they are mixed, while on the retaining wall are W. A. Richardson and Gloire de Dijon."

A GARDEN INDEPENDENT OF WEATHER.

Here we turned aside for a little time in order to glance round the range of glasshouses, and I asked Mr. Barton how long he had been in charge of the gardens at The Hill.

"Four years; and before that I was eight years and a half foreman in Sir William Lever's gardens in Cheshire. I have been gardening for twenty-four years. I started when I was eleven, and I am now thirty-five.

"With respect to the houses, in the two Vineries Black Hamburgh, Muscat, Alicante, and Foster's Seedling are grown, and in the Peach house Royal George, though we use it chiefly for Tomatoes. In the warm plant house Palms, Orchids, Crotons, and Ferns are the principle features. The Ferns include a very beautiful and rare specimen of Nephrolepis Marshallii. The houses are chiefly used to supply the bedding, and all interest is, of course, secondary to that of the terraces and pergolas. So far as they are concerned, every detail has been considered, and statuary, seats, and steps from terrace to terrace have been arranged to harmonise with the surroundings, and to give enjoyment to visitors. There is nothing to tire either the feet or the eyes, and the whole of the garden, including the new pergola, may be explored without any sense of weariness by anyone who is easily fatigued. There is also so much of it under cover that it can be enjoyed no matter what the weather is like. I believe there is no other Italian garden like it in England, and you will agree that the architect, Mr. T. H. Mawson, is to be congratulated upon his success."

ALFRED WILCOX.

NEXT week: Interview with Miss C. Agnes Rooper, Pen Selwood, Bournemouth.

Digitized by Google Original from CORNELL UNIVERSITY

Generated on 2013-10-28 08:17 GMT / http://hdl.handle.net/2027/coo.31924094256223 Public Domain in the United States, Google-digitized / http://www.hathitrust.org/access_use#pd-us-google

the ground, and marked so that they can be readily found again, examined, and, if they contain any of the insects, destroyed. As regards next year's fruit crop, the outlook is far from bright. Many of the trees, Apples especially, have been so badly crippled by aphides that it will take them a long time to recover.

Rose Classification.

September 20th.—It is difficult to see how the present classification of Roses into Hybrid Perpetuals, Teas, Hybrid Teas, and so forth, can be maintained. Already they are extraordinarily mixed, and with every year the complication increases. Frau Karl Druschki, for example, is called a Hybrid Perpetual, but it really resulted from a cross between the Hybrid Perpetual Merveille de Lyon and the Hybrid Tea Caroline Testout, and it is probably to the latter that it owes its late-flowering quality. I do not know the parentage of Merveille de Lyon, but I can follow the other parent of our finest white Rose a little farther. Caroline Testout was obtained by crossing the Tea Madame de Tartas with the pollen of the Hybrid Tea Lady Mary Fitzwilliam, and by the latter by crossing the Tea Devoniensis and the Hybrid Perpetual Victor Verdier. Here, then, among the immediate known ancestors of Frau Karl Druschki we find only two Hybrid Perpetuals against three Teas and one Hybrid Tea, yet it is classed as a Hybrid Perpetual. Take the case, again, of the so-called Hybrid Tea, Gruss an Teplitz, It was obtained by crossing first the Bourbon Sir Joseph Paxton with the Noisette Fellenberg, then the selected seedling with the Tea Papa Gontier, and finally the selected seedling with the Bourbon Gloire des Rosomanes. The result of thus crossing a Noisette, a Tea and two Bourbons is called a Hybrid Tea. The fact of the matter is there has been so much crossing that the old classes no longer exist, and no useful purpose is served by retaining them. For the ordinary gardener it would be better merely to divide them into Roses which flower only once, and those which flower a second time.

H. C. DAVIDSON.

The Secrets of Successful Vegetable Cultivation.

INTERVIEW WITH MR. A. BASIL, AT THE GARDENS, WOBURN PARK, WEYBRIDGE.

OF both the gardens and the gardener at Woburn Park, which I visited at the end of July, it may be said that they are exceptionally interesting. Woburn Park itself has a place in history. The estate formed part of the lands granted by St. Edward the Confessor to the Abbot and monks of the Benedictine Abbey at Chertsey. It passed through the hands of many owners since that period, until, in 1834, it was purchased by Lady King, and a few years later by Lord Kilmorey, who almost entirely built the present fine mansion in white stone. In 1876 it returned to the Petre family, who had formerly possessed it, and in 1879 Monsignor Petre, afterwards the thirteenth peer, made important additions, notably the block of buildings in red brick in Queen Anne's style. Under his auspices the whole place was fitted up with all the requisites for a first-class educational establishment. In the summer of 1884 both the estate and schools, which are known as St. George's College, were sold to the Very Rev. Father General of the Congregation of the Josephites. Amid all these changes, the charms of the beautifully-wooded grounds have been preserved, and the rare and curious trees planted by the then owner, Mr. Southcote, a hundred and seventy years ago, still enrich it. As to the gardener, the fame of Mr. Basil as an exhibitor and vegetable grower is known far and wide, and especially in the South of England, where he has carried off hundreds of prizes. But, when he met me at the entrance to the gardens, where some stately Horse Chestnuts do sentinel duty, our talk was, first of all, about the trees which are even more ornamental than the massive gateway which formerly adorned the palace of the Duke of York.

ST. GEORGE'S COLLEGE, WOBURN PARK.

"You appear to have a very fine collection," I said, as we walked through a long avenue of Limes.

A Collection of Rare Trees.

"Woburn Park is credited with having one of the best collections of trees in this country," rejoined Mr. Basil, "second, perhaps, only to Kew Gardens. You may be interested to know that the largest in girth of the Limes has a circumference of twenty-one feet, the tallest reaching to a height of a hundred and twenty feet."

MR. A. BASIL.

"It would interest me to hear, as we proceed, any details of particularly notable trees."

"The alley of Lombardy Poplars and Cypresses we are passing might be mentioned, and the Hornbeam, the Yew, and the white Poplar at the foot of the hill are worthy of notice. Then, there are the Willow and the Aspen, the latter being about fourteen feet in circumference."

"What is the height of the Beeches on the slope?"

"Nearly two hundred feet, and they are twenty feet in girth. The Yews in the avenue on the brow of the hill are several hundred years old; the largest has a girth of nine and a half feet, and the tallest is fifty feet high. Among the fine specimens of Sweet Chestnuts is one with a trunk twenty-six feet round."

Shrubs and Conifers.

As we descended the slope, from which a good view of the senior and junior houses of the College and of the boys' playground is obtained, I noticed a lofty Scottish Pine.

"That Pine," observed Mr. Basil, "has a bole of over a hundred feet in length, and, as you see, it towers far above its neighbours. The Cedar of Lebanon to the right is nearly two hundred and fifty years old. It was one of the first planted in England, and its girth (sixteen feet) far exceeds that of the Cedars at Kew, while its spread covers an area of close upon five hundred square yards."

"You appear to have in the plain a garden devoted to shrubs."

"It is a winter garden, between six or seven acres in extent, and is planted chiefly with Laurels, Rhododendrons, Bay Trees, Junipers, Hollies, Holm Oaks, and various Conifers. The object is to have this part of the park fresh

and green and full of life all the year round. Rhododendrons thrive as well as in their native soil, and stretch for over a mile, and some shrubs attain a height of fifteen feet, and bear bunches of blossoms eight inches in diameter.

"In other portions of the park," continued Mr. Basil, "all varieties of Hawthorn are grown, and also about twenty different kinds of Oaks, the largest crown being fifteen feet in diameter, and the thickest bole fourteen feet in circumference. There is an Alder with a girth of seven feet, probably the biggest in England; an Elm twenty feet in circumference, and about a hundred and twenty feet high; and a splendid Tulip-tree. Many of the trees were planted by Philip Southcote, who acquired the property in 1735, and brought it to such a degree of ornamental beauty, as had not been previously attained."

The Bedding.

We next turned our attention to the bedding, quite a feature being nearly forty vases containing Ivy-leaf Geraniums, Marguerites, and Petunias. The combinations in the beds included Geraniums (Mrs. Pollock) and a border of Alternantheras; Roses (Mrs. W. J. Grant), mixed with black Nasturtiums; mixed Begonias and blue Lobelias. But the most important part of the bedding just here are the Rose beds, standard and dwarfs, edged with Pyrethrum.

"How many Roses do you grow," I inquired.

"About three hundred in thirty varieties, of which the best, in addition to Mrs. W. J. Grant, are Prince Camille de Rohan, Gloire Lyonnaise, Merveille de Lyon, Mrs. John Laing, Paul Neyron (the biggest Rose), La France, Alfred Colomb, Souvenir de Malmaison, Captain Hayward, Catherine Mermet, Fisher Holmes, Gustave Piganeau, Maman Cochet and the white variety, Kaiserin Augusta Victoria, and Viscountess Folkestone."

"You have standard Roses also near the White House?"

"Yes, in the long flower beds under the conservatory, which, by the way, is full of Tomatoes. These beds are made up of combinations of Geraniums (Flower of Spring) and Alternantheras; Fuchsias and Pyrethrums; Sweet Williams; Palms, Geraniums (Mrs. Pollock), and Alternantheras; cultivated Foxgloves (six feet high); and Geraniums (Mrs. Pollock) and Nasturtiums, the border being of mixed Pinks."

"And the pretty Italian garden with the fountain in the centre?"

"The aim here is to have plenty of colour, but not two shades of colour, so as to avoid one shade being killed by the other. The two beds, with statue and vase, are composed of Cannas planted two and a half feet apart, interspersed with Phlox Drummondi and Coreopsis; there are two beds of Stocks and Asters, with a border of Alternantheras and Pyrethrums; two of earlier Stocks, and a border of Nasturtiums; two of Geraniums (Vesuvius), white Marguerites, yellow Coreopsis, and a border of Geraniums (Mrs. Pollock), mixed with Perillas; two beds of Geranium Lemoine, and Geraniums Archduke Rudolph, edged with Pyrethrums and Iresine Lindenii. The fourfold border consists of Geraniums (Flower of Spring), and Alternantheras of varied colours."

The Cultivation of Sweet Peas.

Passing the shrubbery, and a long, mixed border, with a hedge of Yews, and Dahlias, Pæonies, perennial Phloxes, Asters, three varieties of Lilies (L. auratum, longiflorum, and tigrinum Fortunei), Sweet Williams, Foxgloves, Coreopsis, Mignonette, Stocks, etc., in front, we made our way into the kitchen garden, where a magnificent display of Sweet Peas claimed my attention. These I was not surprised to see, for, just before my visit to Woburn Park, Mr. Basil had received at the exhibition of the National Sweet Pea Society seven first prizes and one third, including the Horace Wright silver challenge bowl and the silver medal.

THE STATELY ENTRANCE GATES OF WOBURN PARK.

"Have you shown Sweet Peas frequently?" I asked.

"This is my first year, but my firm conviction is that anyone who can grow good culinary Peas can also grow Sweet Peas; and, as you probably know, I have grown and shown culinary Peas to a very considerable extent."

"What is your system of growing Sweet Peas?"

"They are planted in a double row, eighteen inches apart, each plant being a foot distant from the other. These, in this plot, were sown in February, and put in pots in a cool conservatory, twelve seeds in a pot. They were kept in the conservatory until they were two inches high. I then transferred them to a frame, where they are about a foot from the glass. Just a fortnight before planting out in April, I took the lights off. By the way, I strongly recommend putting twelve seeds in each pot, but thinning out to six when they are one inch high, because the seeds do not always germinate, and if I only put six seeds, I run the risk of having only half."

"How should you describe the soil?"

"It is neither light nor heavy, but very fertile, and always good. For Sweet Peas I trench three feet deep. On the bottom of the first spit I put six inches of cow manure; on the second I generally have the leaves and refuse of the garden, leaf-mould, chicken manure, and a small quantity of lime; and on the top part a good dressing of bonemeal, with a dressing of soot before planting. In fact, I make the ground as rich as possible without the aid of any artificial manure. Sweet Peas do not require much artificial manure."

"Can you tell me the height of some of your beautiful plants?"

"They are from fourteen to fifteen feet high, and the stems are an inch and a half wide, and flower stems about two feet long."

"How many varieties do you go in for?"

"There are here about forty-two, six of which are my seedlings. The taller are Woburn Park White, a white flower developed from Helen Lewis, white, with picotee edge. The other is an improved Miss Willmott."

"Of the other varieties, which do you consider the best?"

"King Edward VII., Dorothy Eckford, Black Knight, Countess Spencer, Helen Lewis, John Ingman, Gladys Unwin, Mrs. Walter Wright, Lady Grisel Hamilton, Jeannie Gordon (a very strong grower), Dainty (the best of the Picotee edge), Helen Pierce, and Agnes Johnston (a very strong grower). In addition to these varieties, I am growing, on trial ground, Paradise, Enchantress, Phenomenal, Evelyn Byatt, Unique and Shasta, some of which I may grow for show next season. Speaking of showing, I also exhibited at Norwich this year, and took second prize."

"Do you care to say anything more about Sweet Peas?"

"Only this, perhaps, that, if you want the blooms to travel, they should be cut six or seven hours in advance, during which period they should be put in water. At the end of the time they will have absorbed sufficient water to last for twenty hours without withering. A little tissue-paper should be put round the stems."

Grafted Pear Trees.

"Would you prefer now to speak of vegetables, or to tell me a little about the fruit, which appears to be grown in great quantities in your garden?"

"We might dispose of the fruit here first. Twenty years ago we greatly enlarged the size of the kitchen garden, which is now three and a half acres in extent, and as nearly square as possible, in order to work it easily. In addition, we have four acres of orchard, three acres under glass, and in one acre, between the fruit trees, are grown Black and Red Currants, Gooseberries, Strawberries, and Rhubarb. I planted all the fruit trees when I came twenty-two years ago."

"How many varieties of Pears do you grow?"

"About fifty-four. They are grown on the walls, as cordons and as pyramids, and at least fifty of the trees have been grafted on the other good varieties. That is to say, there are many trees of good variety, such as Marguerite Marrilat with Conseiller de la Cour, Baltet with Beurré Bachelier, and Charles Ernest with Beurré Dumont."

"I should like the names of the twelve best bearing varieties."

"Citron des Carmes, Souvenir du Congres, Marguerite Marrilat, Beurré de Mortillet, Good William, Nouveau Poiteau, Baltet Pere, Emile d'Heyst, Durondeau, Duchess d'Angouleme, Beurré Bachelier, and Pitmaston Duchess. My

best twelve for exhibition are Beurré Diel, Glou Morceau, Doyenné du Comice, Nouveau Poiteau, Conseiller de la Cour, Emile d'Heyst, Durondeau, Duchess d'Angouleme, Pitmaston Duchess, Beurré Alexander Lucas, Beurré de Fonqueray, and Beurré Bachelier. I am very pleased if I can get these varieties for my October or November show. Four good varieties for September and October are Beurré de Mortillet, Marguerite Marillat, Souvenir du Congres, and Triomphe de Vienne. I bought last year and grafted twelve new Pears from M. Baltet in France, the varieties being:—President Roosevelt, Belle Guerandaise, Beurré de Lindauer, Dorset, Eva Baltet, Jeanne d'Arc, Martin Clavier, Madame Ernest Baltet, Virgenie Baltet, Professeur Grosdemange, Professeur Bazin, and Bergamote Arsene Sannier."

Favourite Apples.

"You grow even more varieties of Apples, I conclude?"

"About sixty. Of dessert, the twelve best include Beauty of Bath (of which, if I had only two acres of ground, I should grow one acre), Cox's Orange, King of Pippins, Quarrenden, Duchess's Favourite, Lady Sudeley, Blenheim Orange, Worcester Pearmain, Duchess of Oldenburgh, and Sturmer Pippin. The best six for show are Cox's Orange, King of Pippins, American Mother, Charles Ross, Allington Pippin, and Gascoyne's Scarlet."

"What are your favourite cooking Apples?"

"Ecklinville Seedling for autumn, and Wellington for winter. Here are twelve kitchen Apples which do well here, and are best for show:—Peasgood's Nonsuch, Emperor Alexander, Lord Derby, Prince Albert, Tyler's Kernel, Beauty of Kent, Bismarck, Bramley's Seedling, Ecklinville, Warner's King, Gloria Mundi, and Loddington."

Exhibition Peas.

"Now, I think we had better talk about Peas, taking the exhibition varieties first."

"Here is my trial ground, on which I have twelve or thirteen varieties, including Gladstone, Daniels' Distinction, and The Bell, which got first-class certificates at Wisley. Then there are the Scotsman, Recorder, Competitor, Matchless (one of the best for size and productiveness), Stourbridge Marrowfat, Duke of Albany, and the Centenary."

"Which do you consider your best Pea?"

"Recorder, which was brought out by Messrs. Daniels, and which I may mention should be put in a fortnight earlier than the ordinary mid-season Pea. I showed some this year, at Norwich, about seven and three quarter inches long, and eleven Peas in a pod."

"I suppose you have shown frequently at Norwich?"

"For fourteen years in succession, in twelve of which I took first for Peas, and two seconds. The shows are open to all Messrs. Daniels' customers in the United Kingdom, and, on one occasion three hundred and twenty-three dishes of Peas were exhibited. There are always a hundred competitors."

"You must have won a record number of prizes for vegetables, Mr. Basil."

"In fifteen years I have taken six hundred and eight prizes, mostly for vegetables and fruit. I have ceased for six or seven years to exhibit at local shows, because I took all the prizes; but I continue to exhibit at the leading distant exhibitions."

THE CONSERVATORY AND PART OF KITCHEN GARDEN, WOBURN PARK.

"What varieties of Peas do you grow for kitchen purposes?"

"Twelve beds of improved Ringleader, six of Duke of Albany, and six of Autocrat. As to treatment, I grow Peas exactly in the same way as Sweet Peas, except that I give them more water in the summer."

"Do you grow many Onions?"

General Vegetables.

"In autumn I sow eight rows of Ailsa Craig, and as many of the White Elephant Tripoli, as both grow very large Onions; for show, we grow two beds, containing about three hundred and fifty Ailsa Craig, and about a hundred and fifty Improved White Spanish. The ground is worked in much the same manner as for Sweet Peas. Some of the best bulbs weigh two to two and a half pounds each. We also grow about twenty bushels of maincrop Onions, Brown Spanish and White Spanish being the best keepers."

"Do you grow Runner Beans for show?"

"Yes, Giant White, Giant Scarlet, and Best of All, show Beans being often from twelve to fourteen inches long. Of Dwarf Beans, Canadian Wonder, which we get nine to ten inches long, is our favourite. A second sowing is made, of Perfection Stringless Beans. Beans I treat much the same as Peas, save that I give them even more water.

"Beets," continued Mr. Basil, "are another vegetable which we show, and I have grown them fourteen to sixteen inches long. The three varieties are Praynell's Exhibition, Blood-red and Cheltenham Green Top, the last being the favourite for showing. As to my culture for show Beet, I make holes two and a half to three feet deep, fifteen inches apart, in rows eighteen inches asunder. Each hole at the top should be from four to six inches. I use good loam and vegetable refuse, a little kainit, and wood ashes, sifting it fairly fine, in order to fill each hole."

"Which variety of Cauliflower do you show?"

"Autumn Giant, but I also grow Early Erfurt and Early Giant, as well as the Michaelmas Broccoli. I get Autumn Giant six to eight inches across."

"How do you manage that?"

"They are sown early in January, in a box in the conservatory, and then lightly transplant to a frame, where they become accustomed to open air. Towards the end of March, or early in April, they are planted out. The later kinds I sow in March in the open, and transplant at the end of May or early in June. These bear in November. Similar treatment is given to Broccoli."

"How many Sprouts do you grow?"

"About three thousand plants in two varieties, Exhibition and Defiance."

The System With Tomatoes.

"Tomatoes, I see, are grown very largely?"

"We grow inside Daniels' King Edward and Sutton's Perfection. There are fifty-two plants in one house. Outside is a long border, planted along the wall of the conservatory. Every year I lift all the soil in the houses where the Tomatoes are grown, and supply new loam. The latter is mixed with bonemeal, which is placed on the bottom, with rough turf, loam being used to fill up. I have shown Tomatoes at Norwich weighing nearly one pound each. As I am speaking of the conservatory, I may say that this is in five compartments, which are devoted to flowers and early vegetables. We have forty-two frames, which are used for early vegetables and some flowers, and later on in the year we use them for Melon growing. In the Vineries Black Hamburgh is chiefly grown."

Turnips and Celery.

"But, to revert to vegetables, what about Parsnips?"

"We grow the Hollow Crown and The Student, which are both good for showing. The culture is similar to that of Beet, but the holes should be made deeper and larger, and more leaf-mould should be used; also river sand and a little soot should be added. I show Parsnips about three feet long. We grow three varieties of Turnips, starting with Early Milan, proceeding to Snowball, and finishing with White's Stone, which is the favourite, because of its excellent shape. As to cultivation, I work short vegetable refuse in the ground, mixing with it a small quantity of lime. Before sowing seed I give the ground soot, and I throw plenty of wood ashes over the leaves while the plants are growing."

"How many varieties of Celery do you grow?"

"Four: Ivory White, Giant Red, Wright's Giant White, for exhibition, and about twenty-five hundred plants of Standard Bearer, which is the best for winter use. I sow in the conservatory in February. In March, when the young plants have become large enough, I prick them out in frames, give them a little heat, and plant out in May the beds being four feet apart, the plants at intervals of two

feet. The Celery is grown in trenches eighteen inches wide and one foot deep. I dig up the bottom of the trench, in which is put about six inches of cow manure; and a few days before planting out some lime and a little poultry manure are worked in. Celery wants a great deal of watering, and with water I always give a certain proportion of a fertiliser. Brown paper is used for blanching exhibition plants."

Leeks and Cabbages.

"Your Leeks appear to be thriving."

"We grow the Monstrous and The Lyons, which is the largest of all. I sow at the end of January in the conservatory, transplant when big enough in boxes three inches apart, put them in a frame in March, and plant out in May. I plant in trenches fifteen inches apart, and earth them up from twelve to fifteen inches. One hole is made between each plant, for watering and feeding. The ground is prepared in a similar manner to that for Celery, but a little leaf-mould is used to make the earth lighter."

"Which is the best Carrot for exhibition?"

"The best for showing in autumn is Improved Intermediate, which is also a good keeper. The other varieties used are Scarlet Horn and Early Nantes. The culture varies little from that of Beet, but I mix more leaf-mould, and add river sand and a little soot. We grow about eighty Vegetable Marrows, the varieties being Long White and the Green. The best for colour of red pickling Cabbage is the Nigger Head, of which we grow two hundred and fifty. As to Cabbage, four sowings are made. First we sow Ellam's Early at the end of July, then Flower of Spring about August 15th, Daniels' Defiance in March, and Flower of Spring again at the end of May. The last are planted after early Peas, and the variety is very useful for November and December. The soil suits Cabbage remarkably well. Daniels' Defiance, to distinguish it from two other Defiance Cabbages, which do not resemble it, is the biggest Cabbage I know of. I have grown some seventeen pounds each. I am always sure to obtain good show Cabbages if I can plant them where my show Peas have been grown. As to culture, before planting I give lime, and put every Cabbage three feet apart each way. Plenty of liquid and a good dusting of wood ashes are given during their growth."

The Best Potatoes.

"Of course, Potatoes are a very big feature?"

"I grow about thirty-six varieties. I buy the seed from three different English firms, some from Scotland, and some from Ireland. All the crops of the English varieties are poor and suffering from rust, with haulms only about one foot long. As you see, the Scotch seed has produced some very healthy plants, with haulms two feet long, but the Irish seed has turned out very much the best. All the plants are healthy, and are a foot taller than the Scotch. This seems to show that Ireland is the best country for seed Potatoes."

"Do you grow Northern Star?"

"I have grown it and another famous Potato, the Eldorado; but as they only made four inches of growth, they will not be planted in Woburn Park any more."

"You might give me a dozen of your best varieties."

"Express, Duchess of Cornwall, Factor, Up-to-date (the very best), Royal Kidney, Sir John Llewelyn, Royal Norfolk, Satisfaction, Dalmeny Beauty, Snowball, Warrior, and Snowdrop."

"What is your system of cultivation?"

"I dig the soil in autumn about fifteen inches deep, put some good cow manure at the bottom, and keep the surface as rough as possible for winter. In the autumn I put a heap of leaf-mould together, which I mix with some bonemeal and wood ashes. In spring I plant out in rows three feet apart, and two and a half feet from plant to plant. Holes are made six inches deep, half of each hole being filled up from the prepared heap of leaf-mould."

Mr. Basil's Career.

"I need hardly ask if you like to grow vegetables?"

"I never become tired of seeing anything grow well. But, though I like to grow fruit and flowers, I love growing vegetables, and the contemplation of the humble Cabbage or Turnip successfully grown gives me as much satisfaction as a beautifully-grown Orchid affords a lady."

"You are, I think, a native of Belgium?"

"Yes, and I spent the first thirty-five years of my life in that country. I suppose I may call myself a gardener born, as my father, from whom I received my first lessons, was for nearly forty years head gardener to the Burgomaster of Tirlemonte, a little town in the province of South Brabant. When I was fourteen I became a pupil of Mr. H. Millet, one of the most experienced pomologists of the country, with whom I remained for five years, during which time I took my diploma at the Vilvorde Government School of Horticulture. At the age of nineteen I obtained my first appointment as gardener at Rebec Rognon. A few months later I was offered the post of head gardener at Jette St. Pierre, one of the most celebrated botanical districts in South Belgium, where I remained for five years. I continued my studies at the State Botanical Gardens, and became a member of the Royal Linné Society at Brussels, and of the Society of Horticultural and Arboricultural Progress at Ixelles. Then, for six years, I was chief gardener in the agricultural school belonging to the Josephite Fathers in the Flemish town of Grammont; and in 1884, when the Josephite Fathers came to England, I came with them, as gardener of St. George's College."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 268.—PEARS, MONTBRETIAS, AND ROMNEYA COULTERI.

DEAR KATE,—At last we have summer weather—late indeed, yet most valuable for next year's crops of fruit. The Plums and Pears here are laden heavily with fruit, and we shall have something to do to gather it in safely. No doubt the great abundance of blossom this spring was due to the fine, warm weather of last autumn, which ripened the new growths thoroughly, and so enabled them to bear fruit; and, although this spring was cold, and some fruit trees were blighted in consequence, yet much blossom escaped, and I believe the Plums have been extraordinarily abundant.

There were few bees about when the Pear trees were in bloom, and I helped the blossoms to set by means of a long cane, on the end of which I tied a piece of swansdown (or two rabbit's tails will answer), with which the flowers fully open at noon on each fine day were gently rubbed, so as to disperse the pollen. This is always a desirable thing to do with early-blooming Pears, for there are seldom enough bees about then to fertilise the flowers properly, and certainly it has answered well in my garden, so that we shall have quantities of those delicious Pears Louise Bonne, besides Duchesse d'Angouleme, Doyenné du Comice, and, for late work, Belle d'Angerin, those great fruits which come in so usefully at Christmas. But we are not going to leave the gathering-in of them to fate; for I fear that more than half of the fruit crops of Great Britain are wasted in this way, and it is really sad to think how careless we are, as a nation, in not making the most of the good food which Nature provides.

The Ripening Period.

Perhaps you don't know that Pears and Apples never ripen on the tree, but that there is a short three days in the case of each variety during which the fruit is ready to drop from the bough, although it must still spend some time (varying in different cases from a few days to several months) in coming to perfection. The great thing, then, is to gather them during this dropping time; if you pick them before it arrives, the Pears will shrivel and never come to perfection, but if you don't get them in safely before they drop, they will become rotten from bruises before they ripen.

So you see that the utmost vigilance is necessary; and I advise you, if you want perfect dessert fruit, to examine your Pears and Apples each day at this time of year, to ascertain the psychological moment in which they must be gathered in. Then take a broad, flat basket, in which you have laid a soft cloth, and try your fruit. To do this, lift up a Pear in the hollow of your hand with a slight jerk, from the perpendicular to the horizontal position; if ready to drop, it will be left in your hand, but, if not ready, it will still be attached to the stem. When it comes off, lay the Pear gently in the basket, and so on until you have a basketful; but do not place one fruit upon another, and, whatever you do, don't pinch the fruit to see if it is ripe, for the smallest bruise is fatal, and moreover it never is and never can be ripe on the tree, as I have explained above.

There will, of course, be some Pears on the ground; these must be gathered up separately, and will make excellent tarts, or stews, but are of no use to lay down for dessert, as they are certain to be bruised. In the case of high trees, which you cannot reach to the top of, it is a good plan to place nets beneath them stretched on stakes, to catch the fruit as it falls without bruising it; for it is disgusting to go out into your garden on the morning after a storm, and find that most of your fruit has been ruined.

But, to return to your basket—when it contains one layer it should be emptied in the fruit-room, or a dry, airy cellar, laying each fruit down with the hand, on clean newspaper, not rolling it out of the basket as I have seen done, when every fruit will be more or less bruised and spoiled.

Each variety should be laid by itself, and you should not leave the choice of the Pears for dessert to careless hands, for it needs a sharp eye, and a good nose, too, to determine exactly the time when each fruit is fully ripe, yet has not become "sleepy" in the middle. Moreover, that deadly pinch is almost certain to be given in a doubtful case; so choose your dessert fruit yourself every day, and you will be rewarded by perfect specimens, which are not, unfortunately, too common on our tables.

The temperature of the fruit-room should be always moderate; frost must not penetrate it, but a high temperature is not desirable, and darkness is better than light. The air should be dry and pure, too; a close, damp place is too favourable to mildew, which, if it once sets in, will run through the fruits very quickly, and this enemy should always be guarded against by removing every fruit which is bruised or injured, before mildew sets in. Have the top of the window always open, to keep the air fresh; this is a rule which is equally applicable to ourselves, and to flowers and fruits, for stuffy rooms are most unwholesome, and all deadly germs flourish in them in a very unpleasant way.

a knee. In such a position they would be quite useless to it.

March 17th.—Very beautiful is Gentiana acaulis in spring. Its flowers have the deepest blue of any in the garden. A native of the Alps and the Pyrenees, the long, narrow throat suggests that it comes from a place where butterflies are more abundant than bees, for, while the former can easily reach the honey with their proboscis, the latter cannot do so at all, or only with difficulty. Like most, if not all, Alpine plants, the Gentian is a perennial. If it were an annual it

Mr. George Baskett.

would long ago have been exterminated, for many of the seeds would be killed during the severe winter amid snow and ice, and but a small proportion of the remainder would afterwards find suitable conditions for germination and growth. As it grows naturally in colonies, it can be seen from a considerable distance, thus making a show in much the same way as the Compositæ do, by grouping their small flowers on a single stem. The same object is gained in either case—the attraction of insects. In one respect conspicuousness must be considered a disadvantage, for it would also attract browsing animals. In order to protect itself, therefore, the Gentian has developed an exceedingly bitter principle in its leaves, and it is probably to this fact that it owes its continued existence, for no animal would care to eat it. The genus is a very large one, containing over a hundred and eighty species, one of them (Gentiana verna) a native of this country.

March 18th.—It does not appear to be generally known that a large number of the bulbs sold as Roman Hyacinths are really ordinary Hyacinths in an early stage of their existence. They are sometimes called "Dutch Roman." There is not very much difference between them and the true Roman, except that the latter will always remain dwarf, whereas the flowers of the former will increase each year until they attain their full size. The Dutch are cheaper, so if they are bought, the purchaser should obtain the benefit of the difference in price.

H. C. Davidson.

Now that many hardy fruit trees are in bloom, or rapidly expanding, it may be as well to call attention to the fact that thinning out the trusses of bloom freely often increases the crop. If heavily laden with bloom, the trees often exhaust themselves, and have but little energy left for fruiting.

Famous Gardeners at Home.

No. 181.—Mr. George Baskett, at the Gardens, Wood Lee, Virginia Water.

Wood Lee, the Surrey seat of Mr. E. W. Beckett, M.P., at present occupied by Mr. Spiers, is one of the most charming places in the neighbourhood of Windsor, and the gardens have many attractive features; while among the varied experiences of Mr. Baskett, the head gardener, the fact that he was gardener and Rose-grower to the late Lord Penzance, at Eashing Park, Godalming, from September, 1886, until the time of the death of that famous amateur Rosarian in 1900, enables him to speak with special authority on, at any rate, one fascinating horticultural question, the cultivation of the Brier Rose.

A native of Suffolk, Mr. Baskett started his gardening career under his father, at Claydon Rectory, his first important position being at Shrubland Park, under the late Mr. Thomas Blair In these gardens, then among the finest in England, he remained for four years, proceeding next to Ringwood Hall, Derbyshire, noted for its magnificent Heaths. He was next transferred as foreman to Port Eliot, St. Germans, for twenty months, and subsequently took charge of the gardens at The Priory, King's Heath, during the illness of the late Mr. Crawford, a noted Grape-grower.

Leaving King's Heath at the end of four years, Mr. Baskett was foreman for another period of four years at a large market establishment in the South of England, where Roses by the thousand, and Grapes, were grown for Covent Garden market; and, resuming private gardening, he served as chief at Parkstone House, Poole, where he laid out and remodelled the grounds.

"And your work at Eashing Park?" I said, on the occasion of my visit to Wood Lee the last week in January.

"Lord Penzance and myself carried on a great deal of experimental work in the hybridisation of the Roses, in order to ascertain what a progeny would bring forth. The first line we struck out was the crossing of the Rose with the common Sweet Brier, the idea being to get a glorified flower with the perfume of the Sweet Brier."

"Did the result satisfy your expectations?"

"It was beyond our expectations. Not only was the experiment a success, but extra vigour was obtained in the Sweet Brier itself."

"Can you tell me a few of the principal varieties raised?"

"First of all, of course, there were Lord and Lady Penzance. Lord Penzance was a cross between the Sweet Brier and the Persian Brier Harrisonii, and Lady Penzance between the Austrian Brier and the Sweet Brier. We next proceeded to cross Hybrid Perpetuals and Hybrid Chinas with the Sweet Briers, to see the result. Amy Robsart was crossed with a Hybrid China Chenadole; Anne of Geierstein, with La Rosiere and all the dark crimson varieties of the Hybrid Sweet Brier were, by the way, crossed with the same pollen parent. Green Mantle was a cross from Catherine Bell (a bright, rich pink Rose, with a touch of white round the anthers), also Jennie Deans, from La Rosiere (a semi-double scarlet-crimson). Minna, the dwarfest of all the varieties, which was crossed with a Scotch Rose, had a band of pink round the outer edge of the petal. Another cross was Lucy Ashton with Rosa lucida. I think that I have given you a fair sample of the varieties."

"Did you make any unsuccessful experiments?"

"Yes, we tried to cross the Hybrid Perpetual with Rosa Camelliæfolia, with the view of obtaining a glossy foliage, which would withstand mildew. A number of seedlings were raised carrying the foliage of the Camelliæfolia, but the most astonishing point was that we were never able to get the flower to open. The buds were as large as the top of an ordinary egg-cup, but they would not expand. They were just like stone, and ultimately we threw threm away. We also worked hard to get a yellow Brier Hybrid Perpetual, by crossing the Persian Brier Harrisonii and Persian Yellow with the Hybrid Perpetual, but although we obtained several yellow and crimson flowers, the constitution of the plants was so poor that in a few seasons they disappeared altogether. Still, I think that if the cross were proceeded with, making Harrisonii the seed

Wood Lee, Virginia Water.

parent, a yellow Rose with the constitution of the Hybrid Perpetual might be raised. As you are aware, the results of the crosses have been proclaimed all over the world. We received various certificates and medals from the Royal Horticultural Society, in fact all but the coveted gold medal. I lecture at the meetings of the local Mutual Improvement Society on the Brier Rose."

"Do you go in largely for Brier Roses here?"

"You shall judge for yourself, but, first, perhaps, you would like to look round the lawns."

Accordingly, we strolled along the pleasant drive between the lodge and the mansion, noticing the number of Rhododendrons which are backed by Laurels. The property, Mr. Baskett mentioned, as we proceeded, including the gardens and private golf links, is between sixty and seventy acres in extent, and the name of Wood Lee is due to the fact that it is situated under the lee of Clock Case Wood.

"You have fine specimens of Holly," I remarked, as we passed in front of a tree of Ilex Marshalli.

"Yes. Hollies, like Rhododendrons, do well in this soil, which is devoid of lime. So do Araucarias, Wellingtonias, and Cupressus. But we do not love the latter, because there are plenty of heavy trees in the wood, and we want all the light and air we can get. As you see, on the south side of the carriage front there is a rather good specimen of Abies Douglasi."

"Can you tell me the age of the Arbutus on the east side of the house, and is there one stem only?"

"The age is about thirty years, and there is only one stem, but it is split. The tree is twenty feet high, and twenty feet through."

"I notice that there is a bronze sea lion on the terrace lawn."

"There is another on the croquet lawn opposite. They came from Japan. Mr. Beckett bought them when he was travelling in the Far East. The statue close to the conservatory, which, just now, is covered with straw, is of white marble."

"Is there anything special in the conservatory?"

"Not at present. In addition to Palms and Bamboos, there are Cyclamen and spring-flowering bulbs. The roof is covered by Tacsonia. The lawn on the east front is bordered with a sloping bank of American plants, down which there are steps down to the Dutch garden."

"You must be on high ground here?"

"This is probably the highest point in the locality. On a clear day we can see the Crystal Palace."

"I suppose you have a large number of varieties in the American border?"

"They include Kalmias, Azalea mollis, Spiræas, Syringas, Deutzias, standard Magnolia, and standard Brooms."

Passing the south end of the grounds, where the stables and the dairy are situated, and which is bordered by Rhododendrons, with Tulips and other spring-flowering bulbs in the front, my attention was attracted to the summer-house in the corner, containing a striking Japanese curiosity, in the shape of a wooden image. It bears the name of Kobo Daiski, and was made nearly two centuries ago for a Japanese Temple. Then it passed into the hands of an Osaka merchant, whose great-grandchild sold it to Mr. Beckett three years ago. The image, which has the Lotos-flower in its hand, is a wonderful piece of wood carving, painted to represent stone, and the eyes are strangely realistic.

Adjoining the summer-house are old clumps of ponticum Rhododendrons, and Kalmias, and at this point Mr. Baskett observed that he had just been cutting down a bank of old Laurels which stood twenty feet high, and replacing them with a Holly hedge.

Noticing another notable curiosity in the form of an image of Buddha engaged in thought, which also came from Japan, we came to two features of this portion of the grounds, the Brier Walk, by the side of the wall bordering the Dutch garden, and a collection of Tree Pæonies.

"How many varieties are there in the collection of Tree Pæonies?" I inquired.

"About fifty, and there are two hundred plants. All of them are named in Japanese, and came direct from Yokohama two years ago. Providing they are not injured by late frosts, they flower grandly during May. Every colour, from white to darkest crimson, is represented, except yellow, and the flowers are as large as a dinner plate. I have never seen Tree Pæonies do so well as at Wood Lee, and this, I believe, is one of the best collections in England."

"What is your treatment?"

"We give them deep cultivation, and plenty of cow-manure. The soil is good loam."

"I conclude that the Brier Walk is mainly composed of Penzance Briers?"

"Yes, intertwined with a few Roses of the Crimson Rambler type. Alister Stella Gray also works in well. There are about three hundred trees along the walk, which in June is fragrant with perfume. But I think that you have heard enough about Brier Roses already.

"Just here," continued Mr. Baskett, "we have done away with another bank of Laurels, and planted the ground with named Rhododendrons, filling in with Primroses and bulbs for spring flowering. Beyond is the rock garden, which is entirely new. On the bank facing north will be a bank of hardy flowering shrubs; and a part of the rock garden will be planted with Alpine varieties which particularly require shelter, because there is a wall. In the centre there will be a tank for Nymphæas. As you can perceive, this was a part of the old kitchen garden, but we are increasing the space devoted to the pleasure grounds."

"What do you grow chiefly in the borders east of the rock garden?"

"Carnations and hardy annuals, to supply cut blooms for the house. I should have pointed out that the north side of the lawn is bordered by clumps of Pampas Grass, Hollies, and various Conifers."

"How do you fill the Japanese bowl on the lawn?"

"We put in a large plant of Platycerium, in keeping with the character of the bowl."

"There is one very unusual feature towards the bottom of the lawn, I mean the Apple trees?"

"They were formerly in the kitchen garden, and are doing remarkably well transplanted. The varieties are Cox's Pomona, Ribston Pippin, and Ribston Russet. There are also some Pear trees which thrive in this new position. The Pitmaston Duchess had fruit on it over two pounds in weight last year. Other varieties are Williams's Bon Chrétien and Winter Nelis. In the orchard close by are the cream of dessert Apples, such as Cox's Orange Pippin, Blenheim Orange, King of Pippins, American Mother, Gascoyne's Scarlet, Herefordshire Winter Queening, and Cockle's Pippin."

Then we inspected the new Rose garden made on the site of the old glasshouses, which is the latest of all the additions at Wood Lee.

"What is the length?" I asked.

"About forty yards by thirty wide. In planting, I proceeded on the principle of selecting Roses that make a big show, and I have only one variety in each bed. As to numbers, two dozen of L'Argent and Bessie Brown, four dozen of La France, three dozen of Ulrich Brunner, and three dozen of Mrs. John Laing form one half; and two dozen of Fisher Holmes, Horace Vernet, Mildred Grant, Captain Hayward, and Gustave Piganeau, the other half. The raised border all the way round is planted with Teas and Hybrids, chiefly Teas, in batches of not less than a dozen. They were planted from pots last spring, and include Souvenir de Madame Eugene Verdier, Ernest Metz, Papa Gontier, Madame E. Perrin, Marie van Houtte, The Bride, Madame Lambard, Niphetos, Catherine Mermet, Comtesse de Nadaillac, Maman Cochet, the white Maman Cochet, Mrs. B. R. Cant, Perle des Jardins, and Madame de Watteville, which, you see, in an east position is doing well."

"Do you believe in planting some of the tender varieties exposed to the east?"

"Yes, I do, because I have lost a lot of tender Roses when they have been planted south, and kept them when they have been planted east. They are not cut about in the spring so much in the north or in the east as in the south. Often, when I was with Lord Penzance, we lost all our plants in the north. The other varieties are Souvenir de S. A. Prince, Anna Olivier (one of the best for cutting purposes), Waban (an American sport from Catherine Mermet), and Francisca Kruger."

"And the varieties on the walls?"

"On the north wall there are Cheshunt Hybrids and Longworth Rambler, and on the south Madame E. Resal (China), Fellenberg, and Laurette Messimy. On the twenty-two poles are

The Glasshouses at Wood Lee, Virginia Water.

Crimson Rambler, Dorothy Perkins, Alister Stella Gray, William Allen Richardson, Waltham Climbers No. 1 and No. 2, Madame Berard, Bardou Job, and others."

"Is the Rose garden your own design?"

"Yes, including the steps by which it is approached, also the tank in the centre containing gold and silver fish, with the figure representing the goddess of Roses, and a seat to match the steps."

"The gates between the Rose garden and the Dutch garden are very handsome."

"They are old hammered iron, with Roses on them. The Dutch garden, which dates back many years, is divided into three sections. The beds at the north end are filled with three varieties of Wallflowers, yellow, blood-red, and Ruby Gem, edged with dwarf Yews."

"What are the centre beds planted with?"

"Tulips (Prince of Austria and Chrysolora), and red, blue, and white Hyacinths. The ten beds which comprise the south side are planted with yellow, white and coloured Primroses, also Polyanthus. With regard to the latter, I am selecting a strain of my own. The borders all round are full of bulbs and herbaceous plants, the walls are covered with Ivy on the outside, and up the centre of the garden are Yew trees representing snakes climbing up poles."

Outside the Dutch garden is a singularly representative collection of Japanese Iris.

"There are two hundred clumps in fifty varieties," said Mr. Baskett, "and last June some clumps had as many as forty flowers. I intend, however, to transfer them to cooler quarters so that the roots may be nearer the water."

"Do you put Sweet Peas in the two broad strips facing the Japanese Iris?"

"Yes, planted in clumps of a single variety. Here, too, we plant Delphiniums, Hollyhocks, Antirrhinums, and Cactus Dahlias. There are also three rows of Roses (Hybrid Perpetuals), edged with Mrs. Sinkins Pink, and arches at each end. At the back of the Roses are Delphiniums and Lilium candidum. Then, there is a row of Japanese flowering Cherries, about fifty trees on each side; and, finally, a herbaceous border, a hundred yards long, containing all the latest varieties."

The new ranges of houses are some little distance from the pleasure grounds, and are in the valley. One of the ranges—which were erected by Messrs. Foster and Pearson, of Beeston, Notts, and were only finished in May, 1903—consists of three Peach and Nectarine houses, a large Muscat Vine house forty feet long, and a Fig house. The second comprises Melon and Cucumber houses, a Carnation house, an intermediate house, a stove, an Orchid house, and various pits. They are built of Teak, and are exceedingly light and elegant.

In the first Peach house I asked what varieties had been planted.

"Alexandra Noblesse, Dymond, and Royal George Peaches, Cardinal, Early Rivers, and Rivers' Early Orange Nectarines. We started a fortnight ago. In this house are Abutilons, Plumbago, and Fuchsias, to go into the Dutch garden later on; and I have just struck Chrysanthemums, of which we grow about five hundred of the Japanese and Incurved varieties, for decorating and exhibition purposes. They include all the newest varieties, and are quite an up-to-date collection."

"The Muscats look thriving?"

"They are doing extremely well, bearing in mind that they were only planted from eyes in June, 1903. Here we have Strawberries, Royal Sovereign for forcing, and bring them in about fifty at a time."

"How many varieties of Figs do you grow?"

"Brown Turkey, White Marseilles, Negro Largo, and White and Black Ischia. There are fifty plants of Japanese Maples in this house, and quite a dozen varieties. In the late Peach house, Nectarines, which Mr. Beckett prefers to Peaches, are more the feature. The varieties are Pineapple, The Rivers, Stanwick Elruge, Rivers' White, Spenser, and Violet Hative. The Princess of Wales is the only Peach. There are a few Cherries in pots, which yield a good crop of fruit. The house is filled up with Azalea mollis, Bamboos, and some of the Japanese trees which stand out in the open from April to the end of November, and are only injured by frost."

"Are your Orchids imported varieties?"

"Nearly all. There are some very good varieties of Dendrobiums and Cattleyas. In the stove are Dracænas, Crotons, Pandanus, and small Palms, which are all used for table decoration."

"Which Carnations do you go in for most largely?"

"Malmaisons, of which we have twenty varieties. But I am going to reduce the number. We grow three Tree varieties, Cecilia (the yellow), and Mrs. T. W. Lawson and America. In the intermediate house are Palms, Gardenias, and Lycaste, an Orchid which yields a fine lot of white flowers suffused with pink, no two being alike. Cypripedium insigne is grown here, and we are just starting batches of Streptocarpus, Gloxinias, and Begonias. These are for the mansion and the conservatory, and I bring them in in batches, not in driblets. We apply the massing principle, which is the fashion of the day, to bowls of flowers, and also to foliage."

"You have Primulas and Cyclamen in the Melon house?"

"Yes, and Amaryllis throwing up two spikes to a bulb in the Cucumber house. Here you see eight plants of Isoloma. I grew them from a cutting given me three years ago. By throwing up an offset, they can practically be grown all the year round. Isolomas want stove treatment. The flower is orange-scarlet, with striped lips and spotted throat. The foliage is fine. The frames are filled with Violets and bedding plants."

Returning to the pleasure grounds, we looked in the fruit-room, and I specially noticed the fine colour of Gascoyne's Scarlet. In fact, for the end of January, there were many fine specimens of Apples. The new kitchen garden, which is a quarter of a mile in another direction from the mansion, is two acres in extent, and contains a general variety of vegetables and bush fruit.

"About an acre," resumed Mr. Baskett, "is also planted with Apples on the Paradise stock. A speciality in vegetables are the Peas; the early varieties are Gradus (which is a wonderful Pea), and Chelsea Gem. Queen of England is an old variety, good in almost any kind of weather, and other varieties grown are Criterion, Duke of Albany, Stratagem, Chelsoni, Autocrat, and Sturdy. We pick the second week in June, and go on, according to the weather, to the end of October or the beginning of November."

"What are your varieties of Cauliflowers?"

"Veitch's Early Forcing is grown in frames and in pots, seconded by Sutton's Purity; after that Early London and Autumn Giant. We grow Veitch's Exhibition and Paragon for the main crops of Brussels Sprouts; Ellam's Early, Veitch's Maincrop, and Enfield Market Cabbages; Veitch's Scarlet Model, Parisian Forcing, and Early Nantes Carrot. Of Celery, there is nothing to beat Major Clark and Standard Bearer. Veitch's Golden Queen Cabbage Lettuce has the crispness of the Cos Lettuce, and is more readily blanched; of Onions we grow a large quantity, the three varieties being Veitch's Maincrop, James's Keeping, and Ailsa Craig."

"Have you done much showing?"

"When I was with Lord Penzance, I showed Chrysanthemums and table plants largely, taking as many as eleven firsts out of thirteen exhibits at Godalming show. I never grew Roses for showing—they were for the decoration of the garden. At present I have not done much showing here, but last year I was second with garden Roses at Windsor, first with herbaceous plants, and second with Melons and Cucumbers. At the Chrysanthemum show at Windsor I was second with Incurved varieties, and also at Ascot and Reading. At Wokingham I was first with Japanese varieties, and second for eighteen blooms in vases. As time goes on, and we have everything in full order, I may be heard of again."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 137.—COOL GREENHOUSE CLIMBERS, AND MULCHING.

DEAR KATE,—We are now planting climbers in our new greenhouse porch (without hot-water pipes), and as you may like to do the same in yours, I will give you a list of them. There are a number of beautiful things which will do well in such a place if planted in the spring (so that they are able to get a good hold of the soil before next winter), but, of course, we just keep the frost out, by placing a good, well-trimmed lamp (full of oil) on the floor at night whenever the weather is frosty.

PLUMBAGO CAPENSIS.

First of all, Roses—and we have planted the new Field-Marshal, a hybrid, I believe, between the old China Rose (R. semperflorens) and a large red Rose. The flowers are in brilliant crimson, large and well-shaped; and it is said to produce them (as all the China Roses do) in winter as well as in summer. This I can tell you later; if it does, it will be valuable indeed under glass in January.

William Allen Richardson, too, blooms up to Christmas outside, so that it is a good Rose for a cold greenhouse, as it will then go on opening the buds which otherwise get cut by the frost; Madame Falcot, too, is almost a perpetual bloomer, and both these are amongst the loveliest "buttonhole" flowers that can be, so I advise you to put them in (from pots) at once. Then the blue Plumbago (capensis) is a great favourite of mine; the delicate tint of its blossoms is so lovely, and as it is almost dormant in winter, it will stand the cold well, if under glass, and it begins its summer growth in April. It should be pruned rather severely every year, directly after flowering; then it makes fine, fresh growth in spring, with abundance of flowers.

In the most shady corner of the porch we are planting a pink Lapageria; I daresay you know the exquisite wreaths of waxen bells it produces, but it is not an easy plant to manage in a warm greenhouse, for all the blights attack it in such a place, and it seldom thrives under their attentions. It is almost hardy, and can be grown in

MR. W. L. BASTIN,
Gr. to SIR ALEX. HENDERSON, Bart.,
Buscot Park.

THE FRUIT AND VEGETABLE SHOW.

OUR PORTRAITS.

IN connection with the Vegetable Exhibition and Conference held on Tuesday last at Chiswick, we have reproduced the portraits of a few British gardeners who are good "all-round" cultivators, and who have shown a special preference and interest for the cultivation of choice vegetables and fruit. In the present day, when there appears to be an inclination in some quarters to regard the cultivation of kitchen garden crops with a certain degree of indifference, it is good policy on the part of the Royal Horticultural Society to endeavour to show by the proceedings of the past week that kitchen gardening forms one of the most important departments that can be undertaken by a first-class gardener. When a gentleman is about to engage a gardener, he very naturally expects that, whatever additional capabilities the candidate may possess, he at least will be able to produce first-class crops of fruit and vegetables.

As examples, therefore, to young men about to commence their work, the careers of the following gardeners may be studied with profit :—

MESSRS. ED. BECKETT, J. GIBSON, &c.

The two lions in the Vegetable world to-day, especially from the exhibition point of view, are of course Mr. Ed. Beckett, gr. to Lord Aldenham, Aldenham House, Elstree, and Mr. J. Gibson, gr. to R. W. Hudson, Esq., Danesfield, Marlow. But it is not necessary to publish separate portraits of them in this issue, as, being members of the Committee responsible for the Gardeners' Dinner, their photographs appear on our Supplementary Illustration. The same may be said of Mr. James Hudson, who was the author of a paper read at the Conference on the cooking of vegetables, Mr. James F. McLeod, Mr. Owen Thomas, Mr. Geo. Woodward, Mr. Norman, Mr. Fyfe, Mr. Markham, &c.

MR. BEN ASHTON.

The following particulars, furnished us by Mr. Ben Ashton, gr. to the Earl of Lathom, Lathom House, Ormskirk, Lancashire, are interesting :—

"A native of Nottinghamshire, I commenced my gardening career at a very early age in the gardens of Babworth Rectory, near Retford, in March, 1867, under the late Job Smith, who was a pupil of the late T. Speed, of Chatsworth. Mr. Smith was a very able gardener but a very severe taskmaster, which was perhaps a good thing for a somewhat mischievous youngster. After serving an apprenticeship of four years I went to Little Ponton Hall, Grantham, under the late Jos. Towers, but remained only a few months, going afterwards to Nocton Hall, Lincoln (at that time one of the seats of the Marquis of Ripon), as kitchen-garden foreman under Mr. Ridsdale, where I stayed nearly two years. From Nocton I went as journeyman under that celebrated Pine and Grape-grower, the late Joseph Jefferson, Carlton House Gardens, Worksop. If space permitted I should have liked to give some details of Mr. Jefferson's method of Pine-growing. I had not been with Mr. Jefferson many months before he gave me charge of the Pine-stoves and Vineries, and I need hardly say that I was then in my element. I remember his sending me to a noted local show with a quantity of fruit, and his joy at my coming back with eleven 1st and two 2nd prizes for thirteen entries. After serving Mr. Jefferson a little over two years I went as first journeyman at Ashburnham Place, Battle, Sussex, under Mr. Maxton, where I gained much useful knowledge in hardy fruits, &c.

"From Ashburnham I went as flower-garden man to that fine old gardener, Mr. Jno. Derricutt, Pye Nest Park, Halifax, who I am happy to say is now enjoying a well-deserved pension from the Gardeners' Royal Benevolent Institution, of which he was a staunch supporter for many years. After five months I was made foreman. I may here say that Mr. Derricutt was the finest propagator and plantsman that it was ever my good fortune to serve under. He was also an expert Pine and Grape grower, which will be readily understood when I say that he grew in 11-inch pots Black Prince Pines weighing as much as 10 lb. 8 oz., a photo of which I possess at the present time. I left my kind master and friend at Pye Nest after two years' service to go as foreman to another noted gardener, Mr. Robt. Milne, Vale Royal, Northwich, Cheshire, and while with Mr. Milne I created a mild sensation by growing in 7-inch pots Poinsettias with bracts measuring 22 inches in diameter. Many other things were at that time grown well at Vale Royal, notably Calanthes, specimen Mignonette, Eucharis, Begonia Ingrami, &c., in addition to fine Grapes and Peaches; carpet bedding was done on a large scale.

"From Vale Royal I went as foreman to Thurcroft Hall, near Rotherham, where I only remained a few months; after which I went as head gardener and manager to the late Selina, Viscountess Milton, Kirkham Abbey, York, in March, 1881. Her ladyship dying in 1883, I remained with her son, the present Lord Hawkesbury of Hazelbech till March, 1885, when I left to go as gardener to Lord Howard of Glossop, Glossop Hall, Derbyshire, where I remained eleven years. I may here remark that Glossop, from a gardener's point of view, is one of the worst districts in the British Islands, being wet, cold, and the atmosphere soot-laden; successful vegetable cultivation there was quite out of the question.

"I left Glossop to come to Lathom in January, 1896, and, as the story says, 'have lived happily ever since'—happy because I found at Lathom a soil that with good cultivation will grow most things fairly well, and because I found most kind and appreciative employers, who were ever ready to recognise and give a word of praise for whatever is good upon their table, whether fruit, vegetables or flowers.

"Of all vegetables the one perhaps that I cultivate best is the Potato, of which I grow every year about fifty varieties, and for which I have won many prizes, including the Silver Cup (of which I own two) of the Liverpool District Farmers' Club show, which has perhaps the finest Potato show in the country."

MR. W. L. BASTIN.

Mr. W. L. Bastin, gr. to Sir Alex. Henderson, Bart., Buscot Park, Berkshire, is well known as an exhibitor of kitchen-garden crops and fruit. The particular difficulty with which he has to contend is due to the soil of the garden being of a very heavy nature, and resting on a subsoil of clay. He says :—

"I have had the privilege of serving in good all-round gardens since I was fifteen years old. My aim has been to become a good practical and theoretical gardener. I have gained my experience as journeyman and foreman at Preston Hall, Maidstone, Kent; Swyncombe Park, Henley-on-Thames; Haydon Hall, Eastcote, Middlesex; Fetcham Park, Leatherhead, Surrey; and Ashgrove, Sevenoaks, Kent. For some years I was gardener to Admiral Pringle, Digswell, Hertfordshire; and I left that place to take charge of the gardens of Sir Alex. Henderson, Bart., M.P., Buscot Park, in 1897. These are good gardens, and we have a great demand for fruit and vegetables. I have also given some attention to the growing of vegetables for exhibition at the principal shows—London, Shrewsbury, Wolverhampton, Bristol, Cardiff, and Reading—where I have won gold and silver medals and numerous other prizes; also Silver Cup and other high honours at the Temple for fruit and vegetables. I was awarded a Silver Knightian Medal by the deputation from the Royal Horticultural Society in July, 1903, at Cardiff, for a collection of six varieties of vegetables, which I was told was an unusual distinction to be awarded a collection of only six varieties."

MR. NORMAN DAVIS,

although specially well known as a first-rate cultivator of Chrysanthemums, has distinguished himself also in the growing of culinary Peas under glass for consumption in the month of May, being the only cultivator nearer than the Channel Isles who has grown such a crop in anything like the quantity (see *Gardeners' Chronicle*, June 13, 1903, p. 369). He says :—

"I was born at Brixton in 1850, which at that time was principally inhabited by City merchants, and horticulture flourished. My father and grandfather were merchants and keen gardeners, and my love for gardening was inherited. Before I could be started in life misfortunes had overtaken us, and on leaving school at the age of fourteen I had little to depend upon but my own energies. I was, however, placed with an uncle, also a City merchant, where I remained some twenty years, gaining considerable experience in commercial life. Then, upon losing my mother, the home was entirely broken up, and I found myself in lodgings at Walworth; and it was here that my fate as a Chrysanthemum grower was decided. My landlord was a keen amateur 'Mummist,' exhibiting in his small way at the local shows; and it was not long before I was as keen as he. I spent in his garden much of my spare time, and together we often visited the then far-famed Temple Gardens, as well as such nurseries as those of Messrs. Salter, Adam, and Forsyth, bringing home cuttings or plants of the novelties. Upon marrying in 1872 I found more scope for the practice of my hobby, but my sympathies were not confined to Chrysanthemums. I have reared collections of many kinds of florists' flowers. Finding gardening expensive and beyond my means, I started as many others have done, and made my hobby pay for itself; and finally left City life and started as a professional grower. My success as a Chrysanthemum grower, however, is not the interest of the moment.

"After 1890, finding competition growing keener every year, I decided upon extending my business, and came to Framfield, in Sussex, in 1896. I tried market gardening under glass; scarcity of skilled labour in country districts rendered progress slower than I wished, but I think I can fairly say I have turned out various crops with some amount of success. Strawberries (these without heat), French Beans, and Tomatos, all paid well, and always will do, so long as they are well grown and properly marketed. My chief success, however, and what has proved most interesting to me, has been the growing of culinary Peas under glass for marketing in May; these I have grown for six years in succession, and no crop has paid me better: I have been able to

*

FAMOUS GARDENS :: IN WAR TIME. ::

HOW THEY ARE BEING MAINTAINED WITH REDUCED STAFFS.

IV.—Interview with Mr. W. L. Bastin, at Buscot Park, Faringdon, Berks.

UP to about twelve years ago, exhibits of choice fruit and vegetables from Buscot Park were a feature of the leading horticultural shows in various parts of the country, and the highest honours were frequently awarded them, culminating with the gold medal at the Temple Show in 1905. Nowadays Mr. W. L. Bastin, who has had charge of the gardens for the last twenty years, does not exhibit, but that his right hand has not lost its cunning I had ample proof on the occasion of my visit early in June.

Buscot Park, the seat of Lord Faringdon (formerly Sir Alexander Henderson, Bart.), is situated between the small towns of Faringdon and Lechlade, amidst some of the most delightful scenery in the north-west corner of Berkshire. From the terrace magnificent views can be had over the surrounding country, and away into the neighbouring counties of Wiltshire, Oxfordshire, and Gloucestershire. The mansion is an imposing edifice of stone, built some hundred and fifty years ago, and since added to by its present owner; while the estate runs into many thousands of acres, which were until recently farmed by Lord Faringdon himself. Here were bred the famous Buscot cattle and Shire horses, which carried the prestige of British stock-raisers into all parts of the world, and which realised very high prices when dispersed a short time back.

Before going to Buscot Park in 1897, Mr. Bastin had had considerable experience in all branches of his profession. He commenced his gardening career at the age of fifteen (he is now nearly sixty years old), and as journeyman and foreman acquired both practical and theoretical knowledge, first at Preston Hall, Maidstone; then, in succession, at Swyncombe Park, Henley-on-Thames; Haydon Hall, Eastcote, Middlesex; Fetcham Park, Leatherhead; and Ashgrove, Sevenoaks. His next move was to Digswell, Hertfordshire, as head gardener to Admiral Pringle, relinquishing this after some years to take up the position he now holds. Since he has been at Buscot Park he has wrought considerable improvements, and has made his mark alike in the gardens, pleasure grounds, and greenhouses.

A drive of some four miles along a tree-fringed road, and we arrive at the entrance nearest to Mr. Bastin's house. Half-way on our journey he had indicated the principal gates, where starts a winding drive, two and a half miles long, through a beautiful park, leading up to the mansion itself.

"As food production is our principal aim," said Mr. Bastin, "perhaps we had better begin with the houses and kitchen garden, for this is where we are concentrating our available labour. The flower gardens take second place. I might say that the kitchen garden has always been a feature here, and is more so now than ever."

"What staff have you?" I asked.

"At present there are three men and a boy, four women and a girl. Before the war we had eighteen men, but the younger ones joined up in the early days. Boys are just as difficult to get, and the one I have is leaving shortly, though I have another to take his place. The women are extremely willing, and are useful in many ways, but of course they cannot do the hard work, such as trenching, staking Peas, and so on."

The Nectarine range was the first place to which my guide took me, and here I saw several trees giving promise of good crops.

"In this house," said Mr. Bastin, "we have just finished lifting early Potatoes. The Peach is Duke of York; next to it is Nectarine Humboldt, one of the best for second cropping. Cardinal is also on this wall, and is now stoning—we are not forcing it."

"You have Tomatoes now in front, and I see they have some splendid trusses of fruit. What variety do you favour?"

"For early work there is nothing to beat Sutton's Winter Beauty. As you suggest, the fruit is not a good shape, but it is a sure cropper, and the flavour is excellent. For maincrop I know of none superior to Carter's Duke of York."

"This is another fine lot of Nectarines you have in this house," I remarked, as we passed on.

"That is Milton, a second early, which is as good as Humboldt. Here also we have had early Potatoes," said Mr. Bastin.

Outside this range of houses is a long and wide bed, which I was informed is usually devoted to annuals. These have now given way to Potatoes, and I commented on the fine, upstanding haulm, and the general appearance of the plants.

THE BEST EARLY POTATO.

"This variety is the same as we have had in the houses—Sharpe's Victor. As an early it is by far the best I have tried. You can see for yourself what sort of a cropper it is"—and Mr. Bastin cleared away some of the soil, and revealed a fine lot of well-shaped tubers.

"What distance do you allow between the rows?" I asked.

"Twenty-two inches," was the reply.

The next house we entered used to be given over to Cypripediums, but these show the exigencies of the times, and far more flourishing was a batch of well-grown Hydrangeas, some in full bloom, others coming on.

"The Hydrangea is one of Lady Faringdon's favourite flowers," explained Mr. Bastin; "and we provide a certain number for the decoration of the town house. The variety is the good old Dr. Hogg. The Cypripediums are a very fine lot, but you can see they are in want of attention in the way of repotting. They will have to take their chance; but although they may be neglected I shall not allow them to spoil entirely. I have to do all the repotting myself, and the boy does the watering. He has not had time to get round here yet to-day, and the leaves of the Hydrangeas are drooping for want of water."

Passing to the next house, now full of Melons, I asked Mr. Bastin if he was growing the variety he himself raised, Buscot Park Hero, for which he obtained an Award of Merit some years ago.

A BEAN FOR FORCING.

"No," was the reply; "I am not growing it this year, as I am not doing so much with Melons as usual. The variety here is Hero of Lockinge, from which we get twenty-one fruits from nine plants. Not bad, is it? Owing to the food scarcity I have been growing an extra lot of Beans, and have only just got this house cleared of them. I made a special feature of growing Beans last winter, although as a matter of fact we have not been without them for nine years."

"You have, of course, a favourite?" I said.

"Yes, Sutton's Climbing Runner Bean Tender and True. I used to grow Princess of Wales, but I consider this is now broken up in constitution."

Another lot of Orchids—this time a batch of a hundred Calanthes—next engaged attention. "These seem in good condition, and not so distressed as the others," I observed.

"I am trying to keep them all alive," replied Mr. Bastin, "for they are valuable. We used to make a great feature of Orchids. Here is another lot of Cypripediums calling for attention, but vegetables and fruit must come first."

Having visited the second Melon house, we next made our way to the Vineries. A house of Alicante, another of Madresfield Court, and a third of Muscat of Alexandria—the Vines looking most satisfactory, and carrying very fine bunches—were inspected in turn; and then we came to a house of Black Hamburgh.

MR. W. L. BASTIN AND HIS STAFF OF HELPERS.
The photograph includes some who have just joined and others who were leaving, the actual number being as stated in the text.

Digitized by Google Original from CORNELL UNIVERSITY

ONE OF THE OLDEST VINES.

"This Vine," said Mr. Bastin, "is one of the oldest in England. By some people it is said to be the very oldest; others say it is the third oldest. It is supposed to be over a hundred and fifty years old."

"That is about the age of the Hampton Court Vine, is it not?" I asked.

"I believe it is," was the answer; "and it is a question whether that or this is the older."

"It still bears excellent crops," I see.

"Yes; it is a splendid Vine. In 1906 I won the first prize at the Cardiff Show with Grapes cut from it."

"How many Vineries have you altogether?"

"There are six all told. This we are now entering is the early house, and we should be cutting Grapes now, but they will not be ready for another four or five weeks."

"Why is that?"

"Because of the scarcity of labour, and lack of fuel."

Going next through the second-early house, where Black Hamburgh and Foster's Seedling are carrying heavy bunches, I remarked to my guide:

"You must cut an enormous quantity of fruit during the season!"

FRUIT FOR THE WOUNDED.

"We do, indeed," was the answer. "Much of it is sent to the hospitals for the wounded; and we send regular consignments of vegetables to the Fleet. A local society collects it every week."

The stove, which we next visited, was practically empty, save for some Crotons, Anthuriums, and Ferns.

"The Ferns," said Mr. Bastin, "could do with repotting, for they have not been done for three years; but they will have to go, as I cannot spare the time. We have had a nice little lot of Statice profusa, which is now going off."

"You make a feature of Perpetual-flowering Carnations?" I asked, as we entered the next house.

"Lady Faringdon is especially fond of them, and we use a lot of them for decorations, both here and at the town house. Since February I have been cutting a hundred blooms weekly from four hundred plants. We have all the best varieties, but the favourite is Baroness de Brienen—it is a lovely shade of salmon-pink, and is exquisite on the table."

"Who looks after the Carnations?" I asked.

"I attend to these myself," was the answer; "only this morning I potted up a big batch of young plants, which I will show you when we get outside. They are, of course, in frames."

Leaving this house, we moved on to the cool houses, where more Peaches and Nectarines are growing, with Pears in pots, also Tomatoes. Here, as in the next house, devoted to Brown Turkey and White Marseilles Figs, indications are not wanting of the great difficulties under which work is carried on, and of the highly creditable fashion in which they are surmounted.

THE KITCHEN GARDEN.

This completed our round of the houses, and we proceeded towards the kitchen garden, which is about six acres in extent, and is divided into three parts, enclosed by outer walls. But first Mr. Bastin directed my attention to a number of plants of bedding Geraniums, put out between two of the houses.

"These," he said, "are being kept for stock. They include all the best varieties, such as Paul Crampel, Salmon Paul Crampel, Mrs. Pollock, Marshal MacMahon, West Brighton Gem, and Flower of Spring. This is all we are retaining of a very large quantity that used to be employed for bedding out."

In the middle garden—the largest of the three—it was apparent that Potatoes were the principal subject, and I asked what quantity had been planted, and the sorts used.

"We have made a point," was the reply, "of Potatoes, and have planted eight thousand sets. The varieties are Carter's Advancer, which I consider the best second-early there is; and for maincrops, Arran Chief, Up-to-date, Long Keeper, and Golden Wonder. We have also made good sowings of Peas."

"And what are the varieties of these?"

PRODUCTIVE PEAS.

"For early crops, Sutton's World's Record and Early Giant. These are the best and most productive I have tried. For maincrops we have Duke of Albany and Superlative; and for the latest, Gladstone, also a few Autocrat. Gladstone I find does best with us, and seems to suit our soil, which is very heavy, and over a cold clay. I have one special bed, where I am testing the four varieties side by side, under identical conditions—this is the only way to make a fair trial."

Resuming our walk, I was struck by the splendid appearance of all the crops, and inquired what was the yield of Potatoes.

"We have had as many as twenty to twenty-five fold," was the answer; "but this was on specially prepared land, and we cannot expect anything like that for an average yield this year."

Moving on to the next garden, where Celery was being planted out in trenches, a large hot-bed caught my eye, and Mr. Bastin explained:

"This is made up principally of leaves, with a proportion of manure. We utilise the frames first for Asparagus, then for Lettuce—of which we cut eight hundred—then for Vegetable Marrows."

In this garden, too, Raspberries, Currants, and Gooseberries were bearing well, as were the Peaches, Cherries, Pears, and other fruits on the walls; but the flowering plants which bordered the walks, though doing their best to making a brave show, gave proof by their condition that labour was too scarce to give them the attention they required.

Continuing our walk, I was greatly struck by the thriving appearance of a bed of Potatoes, planted by themselves on a square plot.

POTATOES ON HARD SOIL.

"They are planted on the top of the soil," was the explanation, "and are covered by six inches of leaf-mould. This was done as an experiment, to save the labour of digging, as the soil is so hard. The variety is Advancer, and there is another field of it farther round."

In the kitchen garden is a long range of cool houses, in which more Peaches and Nectarines, together with Figs, Pears, Apricots, and Cherries are growing; while the fronts of the houses are used for Tomatoes, Cauliflowers, and salad plants.

"The Cauliflowers are Purity and Magnum Bonum, both excellent varieties," said Mr. Bastin.

Looking across this garden, a couple of rows of Sweet Peas next attracted attention.

"This large bed was to have been full of Sweet Peas, which are another of Lady Faringdon's favourite flowers; but, as you see, we are now growing only the two rows, the rest of the bed being filled with Carrots, Beet, and Parsnips."

"And what are those long rows of Beans which look so flourishing?" I asked.

A BEAN FOR PRESERVING.

"It is a variety which is not grown so much as it should be—Carter's Climbing French Bean, and it comes in very useful for preserving for winter. It can be gathered throughout August and September, and is preserved whole, not sliced. You cannot preserve Scarlet Runners in this manner. Of course, the work of preserving is done by the housekeeper."

"And the Onions, of which I see you have many excellent rows?"

"The first bed is Long Keeper, the other is White Leviathan, which I can recommend for winter work."

"Your Apple trees suggest that you will have enormous crops this year."

"Yes, they are giving wonderful promise. We have all the best varieties here."

Before leaving the kitchen garden we stayed for a few moments to look at the Water Lily pond in the centre. This is a very prominent feature, and contains many choice Nymphæas, Marliacea Laydekeri and Exquisite being particularly noticeable. As the bottom of the pond is cemented, all the plants are in tubs.

We now passed on to the old Rose garden, where the beds are cut on the grass, and intersected by gravel paths.

"It grieves me to see the paths so overrun with weeds," said Mr. Bastin; "but Lord Faringdon is keen on food production, and desires that nothing shall come in the way. So the paths must go untended."

"You manage to prune the Roses," I remarked.

"My daughter has done all that," was the answer; "and she has also given me considerable help in the houses. Mrs. Bastin tried to help me, but she found she had so little time to spare from the household duties."

A MAGNIFICENT PROSPECT.

And now we come out upon the lawn in front of the mansion, and make our way through the long grass, gaily bedecked with Buttercups, Daisies, and other weeds. The grass, owing to lack of labour, cannot possibly be cut, but is by no means unlovely.

Looking across the lawn, one gets lovely vistas on all sides. Nature has been generous, and has endowed the prospect with well-wooded slopes, which give a glorious play of light and shade with the varying hues of green, while here and there is caught a glimpse of the silvery Thames, in this place narrowed to a gently-flowing stream. Cattle browse peacefully in the fields that lie between, and the whole scene is one of infinite charm. But though so natural in every feature, much of the effect is due to the skill of Mr. Bastin, who, by judicious thinning in one place, and planting in another, has opened up to view beauties that would otherwise be hidden, or accentuated them where necessary. Nearer to the house are noble specimens of Cupressus macrocarpa and aurea, Cedrus atlantica, Abies pangutica glauca, and many others.

But time pressed, and tearing ourselves away from the contemplation of this scene, we walked further round to another side of the house, where a series of steps lead down to a pergola covered with climbing Roses of all the best sorts, and from that to the water garden, which terminates in a natural lake some thirty acres in extent. The water comes from the surrounding hills, and finds an outlet in a stream that flows into the Thames.

"The paths along the side of the water gardens are the best kept of all," I remarked to Mr. Bastin.

"We have an old pensioner who makes this his work," he replied. "He spends his time in keeping this place tidy, and would not do anything else if he were asked. But the plants in the water have received no attention for three years, and are showing the effects badly."

POTATOES AS BEDDERS.

Retracing our steps, and passing the north front of the house, we came to what was formerly the flower garden. Now, however, utility has ousted ornament, and where bedding plants have hitherto been grown Potatoes are coming up.

Making our way again towards Mr. Bastin's house, I had time for but a cursory glance at the shrubbery (but that glance revealed a mass of growth rapidly getting out of hand), and none at all for the orchard of eight acres, where, in addition to ordinary fruits, quantities of cider Apples are grown. Then, after noting that in the beds surrounding his house my guide had Beet and Carrots in place of the customary plants, I bade him farewell, congratulating him on the success of his efforts to "keep his end up" in this somewhat out-of-the-way corner of Berkshire. W. J. CHITTENDEN.

Next week the gardens of the Marquis of Ripon, Coombe Court, Kingston Hill, will be described.

Digitized by Google Original from CORNELL UNIVERSITY

Tobacco-plant, to which I have previously alluded, appears in most of them, and no doubt will be largely grown. Schizanthus Wisetonensis, though placed among the novelties, ought surely to be moved on, for it was brought out two or three years ago. It is a very charming plant either for beds or for pots. If the seed is sown in September it will flower during the winter in a cool greenhouse. A "white Wallflower"—White Queen—figures in some lists, but in reality it is a pale yellow, fading to white. Personally, I prefer the stronger colours with which we are more familiar. They are, to my mind, one of the two great charms of the Wallflower, the other, of course, being the scent. In one list is offered seeds of a new Rhubarb, Monarch, which we are told produces stalks sixteen inches long and more, from three to three and a-half inches thick, and one and a-half pounds in weight, yet "extremely tender and juicy, and of a very mild and delicate flavour."

Mr. W. Batchelor.

March 24th.—Why do not the owners of mossy lawns try the effect of sulphate of iron? It is strongly recommended for that purpose by Dr. Griffiths. "In 1888," he says, "a large number of experiments were performed in France, which conclusively prove that iron sulphate is the best substance to use for eradicating moss in pastures. The iron sulphate (one and a-half to two cwts. per acre) should be powdered and then mixed with two or three times its weight of sand or dry soil, and distributed by hand, a manure distributor, or the Strawsonizer. The sulphate may also be applied by means of a water-cart; that is, one and a-half to two cwts. of iron sulphate are dissolved in forty gallons of water, and that quantity used per acre." The amount of sulphate here mentioned should not be exceeded. Indeed, it would be safer not to exceed one cwt. per acre, especially if there is any iron present in the soil.

March 25th.—Time was when Orchids were always kept in a house by themselves. Whether they were better grown under that system is doubtful; they could hardly have been finer than some of the specimens, such as the one shown in the illustration, which are to be seen in mixed collections. It is a very great gain to find that they are not so exacting as they were supposed to be; now almost everyone can grow a few.

H. C. Davidson.

Famous Gardeners at Home.

No. 182.—Mr. William Batchelor, F.R.H.S., at the Gardens, Stoke Bruern Park, Towcester.

Although when I wrote to Mr. Batchelor asking him, with the consent of Mr. B. Wentworth Vernon, the owner of Stoke Bruern Park, to receive me, he said that it was a very bad time to visit a garden, I found this far from being the case. Of course, the historic seat and its beautiful surroundings are seen at their best in the late spring or early summer; but, partly because on the occasion of my visit the weather was fine and bright, and mainly because of the many features of interest, I did not in the least regret that I saw the place early in February. Mr. Batchelor met me at the entrance to the Nut Walk, where I alighted, after driving from Roade, the nearest station. Here, in fact, the estate, extending to some four hundred acres, begins, and a very charming beginning it is. The length of the Walk is about four hundred yards, and the trees, which are all of the common wood Nut, are of great age. In the springtime, when the ground is carpeted with Bluebells, Primroses and Wood Anemones, the appearance must be certainly attractive. Approaching the mansion by a drive nearly a mile long, passing many noble Oak and Ash trees, and noticing on the walls of the handsome dairy the inscription: "To endure and to pardon is the wisdom of life," we paused for a minute to discuss the flowering shrubs which are grown by the side of the drive.

"They include," said Mr. Batchelor, "Marie Legraye, Madame Lemoine and Souvenir de Louis Spath Lilacs, Forsythias viridissima and Fortunei, Deutzias crenata fl. pl., Lemoinei, Watererii, and gracilis, Hibiscuses amaranthus and Ardeni, Anthony Waterer Spiræa, Hydrangea paniculata grandiflora, yellow, white, and Andreana Brooms, Philadelphus coronarius and P. Lemoinei, Ceanothus Gloire de Versailles, Cistuses, Chimonanthus, and Prunus."

"How large are the pleasure grounds?" I inquired, as we made our way into one of the houses, which are close to Mr. Batchelor's own pretty residence.

"About six acres. This forcing house, which was only put up by me in 1903, is used chiefly for vegetables. We force a large number of Potatoes in pots."

"I see that you have some of Sharpe's Victor. Which do you consider the best?"

"There is, I consider, no Potato better than Sharpe's Victor for forcing. I have tried several, and prefer it to any of them. Last year we started new Potatoes on January 31st, and continued them till they were ready in cold frames. I may mention that Dobbie's Factor is one of the best Potatoes for outdoor purposes; its cooking and cropping qualities are excellent. We also grow a few of Northern Star and Eldorado. I like the appearance of Eldorado much better than Northern Star. Last season we had a hundred and ninety-four pounds of Northern Star from fourteen ounces of seed."

"What else do you force in this house?"

"Asparagus, Seakale, French Beans, and Rhubarb. We started Asparagus at Christmas, and French Beans the third week in January. Of the latter, I think Ne Plus Ultra equal to any variety. Canadian Wonder is good, but it takes so much more room to grow than Ne Plus Ultra. As you observe, we force Strawberries here, about two hundred plants of Royal Sovereign."

"I suppose that Tomatoes are a feature in summer?"

"This house is filled with them. Last year we had about eight hundred pounds of fruit. The varieties are Dobbie's Champion, Lord Roberts, Sutton's Winter Beauty, and Up-to-Date."

"How long is the house?"

"Nearly sixty feet, and twelve feet wide. Its strong point is economy of space, and the Mona boiler, by Messrs. Foster and Pearson, is extremely useful."

The next house we entered was a blaze of colour, and I realised that Mr. Batchelor is an ardent lover of Cyclamen. Having congratulated him upon the fine show, I asked how many were grown.

Stoke Bruern House.

"About twelve dozen. They are all seedlings from various sources, and the colours include white, pinks of various shades, rose, red, purple, very deep crimson, and salmon. The rose and salmon colours are not quite so robust as the others."

"You seem to get a great quantity of flowers from a single plant."

"We get from sixty to eighty flowers on a plant in a 6-in. pot, and as many as sixteen in a 4-in. pot."

"When did they begin to flower?"

"The second week in December, and they last until April."

"It would be very interesting and helpful if you would describe your treatment of Cyclamen for the benefit of amateurs."

"The seed is sown in September. It is sown very thinly, and is placed in a cool house. When the seedlings are up, they are put near the glass, where they remain until ready for potting into single pots. This is done when they have made the second or third leaf. The plants are kept growing from the time they are up until they are in flower. When the plants have done flowering, they are placed in frames, and they are never allowed to get quite dry. About July they are repotted and then returned to the frames. In September they are taken into the greenhouse, and put as near to the glass as possible. But the secret of success with Cyclamen is to keep the plants clean by means of the water-can, and to feed them liberally. Dry, light, rich soil suits them. Cyclamen are grown on the front stage, and on the back stage a group of fifty fine Arums. These are all taken out of the pots, and planted out for the summer. This saves a lot of work in the way of watering, and the plants grow much stronger. Trained up the back wall is a William Allen Richardson Rose, from which we have been cutting since Christmas."

"When the Cyclamen are done with, what do you grow here?"

"We fill the back stage with Fuchsias, and the front with various flowering and foliage plants. I find Torenia Fournieri very useful for summer decoration. Seed sown in March will produce fine plants in July, and with very little trouble. My son, who is one of my assistants, takes a great interest in the cultivation of Fuchsias. We first commenced with standards, of which Lord Beaconsfield is one of the finest. The treatment is to take the cuttings about August, keep them growing through the winter, and then in the summer they will form a good head on a 4ft. stem, carrying their large leaves right down to the pots."

"How many Fuchsias do you grow?"

"About a hundred. There are two new single varieties, Dobbie's Andenken and H. Henkel. The flower is pink, verging on red, and the foliage is very pretty. Other singles are:—Princess May, Earl of Beaconsfield, Fascination, Rose of Castile Improved, and Royal Purple. The doubles include White Phenomenal, Rose Phenomenal, Mr. Gladstone, Ballet Girl, Madame Carnot, and Professor Rontgen."

"Azalea indica appear to be another feature?"

"We grow about a hundred. There are from twelve to fourteen varieties, of which the most useful are Deutche Perle, Paul Webber, Madame van der Cruyssen, Simon Mardner, Vernaeneana, and Bernard Andre alba. Azaleas are very useful for buttonholes."

"Do you go in largely for buttonholes?"

"Yes, very largely. Mr. Vernon likes all his staying guests to have buttonholes every day, and many plants are grown with this object in view."

"How many Freesias do you pot?"

"About fifty pots, and about a hundred plants of Streptocarpus, with the same number of Cineraria stellata. Bulbs, except Hyacinths, whose perfume Mr. Vernon does not like in the house, are largely grown. The Daffodils include Figaro, Narcissus, Ajax princeps, Barri conspicuus, Emperor, and Sir Watkin; the Tulips, Cottage Maid, Lorraine, Chrysolora, Rosa Mundi, and Scarlet Duke."

"What about Chrysanthemums?"

"They are grown for cut blooms, about three hundred in all, and buttonholes are kept in view in the case of these also. I find the following varieties very useful for decoration:—Cannell's Favourite, Princess Victoria, Mrs. Thompson, Mrs. Filkins, Sunstone, White Jitsujetui, Sam Caswell, Madame Felix Perrin, and Phœbus. The singles include King of Siam, Elsie Andrews, Miss A. Holden, Miss Cissy Briscoe, Eureka, and Queenie Gordon. For early flowering I prefer Marie Masse, Ralph Curtis, Mrs. E. V. Freeman, Notaire Groz, Market White, Horace Martin, and Albert Casson. We grow the large-bloom Japanese, but they are not so useful to us."

"How many Dahlias do you usually have?"

"About fifty varieties. Our best Cactus varieties are:—F. H. Chapman, H. J. Jones, Clara Stredwick, Ena, Aunt Chloe, Alpha, J. H. Jackson, Mrs. J. Crowe, J. W. Wilkinson, Maid of Honor, Minnie West, and Mary Farnsworth. Of Pompons we grow Amber Queen, Arthur West, White Aster, Bacchus, Douglas, and Whisper; also a seedling of my own—Willie Batchelor."

"For which you have had a certificate, I believe?"

"Yes, in 1895, from the Royal Horticultural Society. Its colour is bright pale scarlet, with white bloom and tip to petals, a very dwarf grower and very free. Another Dahlia for which I received a certificate at the same time was Mrs. W. F. Gore Langton, a single cerise-crimson, with maroon round the eye. Mr. R. Dean, writing to the 'Gardener's Chronicle,' at the time, described Willie Batchelor as distinct in character and decidedly promising."

"Another feature," continued Mr. Batchelor, "is our Ivy-leaved double Pelargoniums. We grow about fifty in pots. The six best varieties are Beauty of Castlehill, Mrs. W. H. Martin, Miss Gulliver, Baden Powell, Resplendent, and Leopard. Of single Zonals we grow Oliver, Lady Chesterfield, John Gibbons, Lilacina, Ampion, and Jessie Moir. The double Zonals are Decorator, Fire Dragon, Hermione, Golden Glory, L. Constable, and Madame Leon Dalloy."

Then we went into the fruit houses, which include two Vineries, with Muscats of Alexandra in one and Black Hamburgh, Sweetwater, and Appley Towers in the other—the latter is a fine late-keeping Grape, and colours well—and in the Peach house I noted Early Alexandra and Royal George Peaches, and Lord Napier and Pineapple Nectarines. In the same house I also observed a quantity of Pears in gutter spouts.

"There are four varieties," said Mr. Batchelor. "Sutton's Bountiful is one of the best of the early Peas. The others are William I., English Wonder, and The Sherwood, which I am trying for the first time this year."

"How many seasons have you raised Peas in gutter spouts?"

"This is the third year. I sow them about the middle of January, and when they are about two inches high I put them into frames. During March I plant them out in the garden, and protect them with Fir-boughs. To prove the advantage of starting the Peas in spouts, I may tell you that last year Peas raised in pots on January 12th were planted out March 14th, and the first dish was picked June 7th; whereas the same varieties sown in the garden about the same time were not ready for picking until June 25th."

"You use the stove for propagating purposes?"

"Chiefly, except in summer, when it is filled with Melons. Sutton's Superlative is one of the best, and Royal Sovereign another. Last year one plant of Royal Sovereign continually produced twins, and one pair came to perfection, growing almost exactly alike. When we weighed them, the fruit came to just over six pounds the pair. We also grow Hero of Lockinge. In this house Ferns are grown in quantity for buttonholes, including, among others, about sixty Maidenhair. Begonias Gloire de Lorraine and Gloire de Sceaux, and Poinsettias are also largely grown, and I find Abutilon Savitzi very useful for decoration. I am trying to grow a standard."

"I see that you have Azalea mollis and Rhododendrons in pots?"

"Yes, and another plant which is useful for decoration is Coleus thyrsoideus, which forms a pleasing contrast to Salvia splendens. Speaking of Salvias, I dot them about in Asparagus Sprengeri on the tables."

"You are fond of decorating?"

"Very. In addition to the house, we decorate the church on festivals. The windows are a feature. We work in texts in flowers. White Marguerites on moss, filled in with various Cactus Dahlias, are effective for that purpose."

Proceeding to the Colonnade, we first had a look at the mansion, which is very striking in appearance. It was built, as Mr. Batchelor explained, by Inigo Jones, in the seventeenth century, Stoke Bruern Park being formerly Crown property, and was almost surrounded by Royal forests, many thousands of acres of which still exist. Charles I. made it over to Sir Francis Crane, from whom it passed to the Arundels; the Arundels were succeeded by the Wentworths, and finally it passed, by marriage, to the family of the present owner, the Wentworth-Vernons.

"When Sir Francis Crane was the owner," continued Mr. Batchelor, "the mansion was entirely in the Tudor style, but in 1886 a fire destroyed the centre block. The present owner rebuilt it in 1891, and it is now divided with a terrace between the two wings, which is laid out as a Rose garden."

"What is the length of the terrace?"

"About two hundred yards. Visitors, whom Mr. Vernon allows to see the gardens in the summer, and who come from all parts, as well as the villagers, to whom they are opened on Sunday afternoons, are always much interested in the words worked in on the balustrading, and sometimes puzzle themselves as to the English."

"You mean 'Tout casse, tout lasse, tout passe'—'All things break, all things weary, all things pass away'?"

"Yes, and while we are standing here, overlooking the park, I may add that different groups of trees in it represent different regiments of soldiers in their respective positions at the Battle of Waterloo. Vases, of which there are about forty, are a great feature. They have all to be filled. I find Sutton's spreading Lobelia (mixed colours) useful for vases."

"What varieties of Figs thrive on the borders at the end of the terrace?"

"Several, including Brown Turkey and Brunswick. There are only Ivies on the mansion, but Wistarias run along the bottom of the Colonnade."

"How are the six beds under the dining-room windows filled?"

"With Tulips, Myosotis, double Arabis, and a hedging of Violas. I suppose we use about ten thousand plants for spring bedding, and for summer about twelve thousand. The large sheet of water in front of the mansion is to be planted with Nymphæas and other species adapted for the purpose, and the rockery underneath the fountain in the middle is to be planted with Ferns."

"And outside the Colonnade?"

"Under the wall there are standard Roses in beds filled with Pansies, Wallflowers and Tulips. All the Pansies are seedlings. In the Rose garden there are sixteen beds, four very long, all filled with spring bedding."

"You might please mention any special varieties?"

"There is one Wallflower, Sutton's Earliest of All, now in bloom, which does particularly well; and one of the best Pansies is Madame Perrett."

"How many Roses do you grow?"

"About a thousand, including a hundred Crimson Ramblers. The Hybrid Perpetuals are:—A. K. Williams, Mrs. John Laing, Prince Camille de Rohan, Earl of Dufferin, Dr. Andry, and Duke of Edinburgh. The Hybrid Teas are: La France, Caroline Testout, Captain Christy, Mrs. W. J. Grant, Kaiserin Augusta Victoria, and Grace Darling. The last is one of the principal Roses under the Colonnade, which grows with large plants of scented Verbenas trained to the walls. Other Roses are:—Teas: White Maman Cochet, The Bride, L'Ideal, Francisca Kruger, Madame Lambard, and Maman Cochet; Hybrid Sweet Briers: Lady Penzance, Lord Penzance, Jeannie Deans, Meg Merrilees, Lucy Ashton, and Julia Mannering; climbing Roses: Paul's Carmine Pillar, Aimèe Vibert, Reve d'Or, Gloire de Dijon, Niphetos, and Dorothy Perkins. I consider Dorothy Perkins a useful and effective

climbing Rose. Our plants were only put in last March; they commence to bloom in July, and continue until cut down by frost."

"What number of Violas do you use?"

"Some two thousand. We take the cuttings in October, and keep them in frames until spring. Our varieties are Florizel, Pembroke, Bullion, Countess of Kintore, Marchioness, and Archibald Grant. Violas are a great feature in all parts of the garden. Florizel is the most useful. It is light mauve, and a very dwarf grower."

"Sweet Peas seem to be another feature?"

"We grow forty sorts, including Dorothy Eckford, King Edward the Seventh, Miss Willmott, Hon. Mrs. E. Kenyon, Dainty, Lady Grisel Hamilton, Lottie Eckford, Agnes Johnson, Mrs. Walter Wright, Lovely, Coccinea, and Lady Nina Balfour. We sow Sweet Peas some time in February in pots, about six seeds in each pot; and plant out in April, about eighteen inches apart. They then fill up and form a good row. A better show is obtained by sowing far apart than by sowing close together."

"Do you grow many Geraniums?"

"Forty varieties of singles and doubles. One of the best single is Olivia (red with a white eye), and Lilacina is a very pretty lilac. Three of the best doubles are Hermione (white), L. Constable (pink), and Decorator (red). Among other plants we have from four to five hundred Begonias and Gloxinias in pots. Some of the former are crested Begonias, and all seedlings. I am very fond of Gloxinias. Ours are principally seedlings, Sutton's and Dobbie's, with great variety of colour. In the summer one of the Vineries is filled with Gloxinias and Begonias. The Hybrid Gesneras are very useful, treated in the same way as Gloxinias; they well repay for a little trouble, if only by their beautiful velvet foliage, of various shades. Double Arabis is very useful for growing in pots, but it must be kept cool. We grow about three dozen plants in pots, and a large number outside."

"Have you many Carnations out of doors?"

"A fair number. One of the most useful is the Marguerite Carnation, which can be grown from seed and flowered within four months. Many of them are very fine doubles. Last year I had two hundred plants, and the Marguerites were doubles of all colours, and sweetly-scented."

"Then, there are the frames."

"Of these sixteen are devoted to Violets, principally Marie Louise and Swanley White (doubles), and Princess of Wales and La France (singles). I like the latter better because it is more compact. One frame contains Christmas Roses, another blue Primroses, and two cuttings of Pentstemons. We cannot rely upon Pentstemons living through the winter, so we always take cuttings, and I am also growing a batch of seedlings, which will make about five hundred for planting round the kitchen-garden walks. I strongly advise people to grow Pentstemons."

"Do you grow many Michaelmas Daisies?" I inquired, as we strolled along the kitchen garden.

"The collection is tolerably representative, and we have nearly forty varieties, including Lady Trevelyan, Robert Parker, Densus, Coombe Fishacre, and Elegans."

"Your herbaceous and flower border here must be a considerable length?"

"It is about three hundred yards long, and contains a large number of varieties. Here are a few names:—Achillea The Pearl, Tritoma, Statice, Solidago, Alstrœmeria, Anemone, Saxifraga, Rudbeckia, Pyrethrum, Ranunculus, Physalis, Phlox, Pentstemons, Aubrietia, Bupthalmum, Campanula, Delphinium, Dielytra, Doronicum, Œnothera, Montbretia, Lupinus, Lathyrus, Iris, Hypericum, Iberis, Heuchera, Hesperis, Helleborus, Hemerocallis, Gypsophila, Geum, Galega, Echinops, Eryngium, Helianthus, Gaillardias, and Verbascum olympicum."

"You might mention a few of the varieties in the charming Pear Walk adjoining the mansion."

"All this kitchen garden, which is overlooked from the house, was planned with a view to appearance as well as utility. Many of the Pears are not worth growing; the best we have are: Pitmaston Duchess, Souvenir du Congres, Doyenné du Comice, Doyenné d'Ete (very early), Josephine de Malines, Beurré Diel, Easter Beurré, and Catillac (stewing)."

In the lower kitchen garden are grown fruits of all sorts, including about sixty varieties of Apples, a number of which are now not often seen.

"Many of these are useless," Mr. Batchelor said, "and we intend to replace them with some of the following varieties:—Dessert: Cox's Orange Pippin, Beauty of Bath, American Mother, Blenheim Orange, Lady Sudeley, and Allington Pippin. Cooking: Lane's Prince Albert, Mere de Menage, Loddington, Wellington, Newton Wonder, Golden Noble, The Queen, Bismarck, and Schoolmaster. This year we are planting seventy-two bush trees of Lane's Prince Albert, a variety which is also sent out under the name of Perkins' A 1. I consider it the best cooking Apple for our soil."

"Can you grow Apricots successfully?"

"Yes, we have five trees of Moor Park, and they do well. Plums are grown on the walls, chiefly, Victoria, Coe's Golden Drop, Early Prolific, Orleans, Jefferson, and Pond's Seedling. Of Peaches on the walls, Hale's Early and Walburton Admiral are the best. The only Strawberries grown are Royal Sovereign and Laxton's Latest of All; and Raspberry Superlative."

"You have some fine clumps of Phlox here."

"They make a good show during the summer. Some of the best are La Neige, Offenbach, Salon, Torfilleur, Stanley, and Rachel."

"We have still to deal with the vegetables."

"I ought to have said that Cucumbers are grown mainly in the frames. Sutton's Every Day is a very useful variety, also Telegraph. To those who care for novelties, I can recommend the French Sugar Pea."

"Which, in your opinion, is the best Broad Bean?"

"The two best are Beck's Dwarf Green Gem and Johnson's Wonderful. Of Runner Beans, I like Sutton's Best of All, and Neal's Ne Plus Ultra. In Brussels Sprouts we have nothing to equal Sutton's Dwarf Green. Ellam's Early Dwarf is a fine Cabbage, and of Carrots I prefer Perkins' Model, Sutton's Early Gem, and New Scarlet Intermediate."

"Do you like the white Celery?"

"Clarke's Early Market White is the best I have ever had. The growth is very quick, and the flavour excellent. Standard Bearer is also a good variety. For summer use, I consider Sutton's Favourite Cabbage Lettuce the most useful, for it stands a long time before running to seed; and Dean's Early Snowball Cauliflower may be cut within four months from the time of sowing."

"Did you start gardening early in life, Mr. Batchelor?"

"I have always been in gardens. My father was head gardener at Elm Bank, Walton-on-Thames, for a quarter of a century. I commenced under him, and then went to Captain Spence, Riverside, Walton, as foreman, and remained four years. I was asked by Captain Spence, my employer, to go out to the Cape of Good Hope as head gardener to him; but, instead, I went as head gardener to Money Hill, Rickmansworth, for a time, and then to Harefield Park, Uxbridge, under the late Lieut.-Colonel Vernon. I was there for fourteen years. Three years ago I came here, but I still look after the present Mr. Vernon's interests in the Harefield estate."

"Have you done much showing?"

"I did a good deal when I was at Harefield. We took first prize at the Uxbridge show for groups of Chrysanthemums four years out of five, and came off very well in respect to fruit and vegetables. We also showed at Chalfont St. Peter, Moor Park, and Harefield Cottage shows, but not for competition. I have taken second prizes at the Royal Aquarium, and I have also shown on several occasions at the Royal Horticultural Society's shows at the Drill Hall, Westminster, and been awarded the Banksian medal. Since I have been at Stoke Bruern, I have shown, though not for competition, collections of fruit, flowers, and vegetables, at Paulersferry and Cosgrove. Last year I made a speciality of Dahlias."

"Finally, I should like to have the details of your summer bedding."

"Geraniums, mixed, principally Henry Jacoby, Flower of Spring, Golden Harry Hieover, Jubilee, and Marten Christine; Salvia patens, Perillas, whose dark foliage is always effective; Petunias, Marguerites, Verbena Miss Willmott, Heliotropes, and various annuals. For edging we shall use Mesembryanthemum, Alyssums, Ageratums, and Echeverias. Last summer we used Lilium longiflorum as dot plants all over the drawing-room beds, and they proved very effective. Under the Colonnade we had all our best sorts of Zonals, and the effect, with all the colours mixed, was always good."

Alfred Wilcox.

Eupatoriums.

These are not so showy as some flowers, perhaps, but there are a few which are desirable for the amateur's greenhouse, being easily cultivated, and flowering freely where many things might fail. They are useful for cutting from, and also for the conservatory. The most showy of those I am acquainted with is E. ianthenum; this is strong-growing, with rather large oval, serrated leaves, with a woolly surface. The blue-purple flowers are produced in large terminal clusters, or racemes, and in a moderately warm house they open about January, and last a long time. After the flowering season is over, the tops may be cut off, and the plants will soon break out and give good cuttings.

The strongest possible cuttings should be secured, and in any light, sandy soil they will root freely if placed in the close propagating pit; any fairly rich compost will suit them. After they are well established, they will do well in a frame or other cool position. To secure short, sturdy growth, plenty of light and air is necessary, and during the winter any moderately warm house will suit them. If the plants are not very strong, three may be grown together in each pot.

E. petiolare.—This is very distinct from the above, having much smaller leaves, and a free, branching habit; the creamy-white flowers have a pleasant perfume, and are produced freely in loose, branching panicles from all the shoots. It is a comparatively new introduction, and I believe it was last year that it gained an award of merit from the Royal Horticultural Society. It has recently been shown again in fine condition. It makes a large plant in quite a small pot. If treated too liberally, it makes too much growth.

E. Weinmannianum is somewhat similar, but does not branch so freely, and has larger heads of bloom, which are also nicely scented; unless stopped during the early part of the season, this grows very tall, but with a little attention will make a nice bushy plant. Late-struck plants may be grown three in each 5-in. pot, but plants of equal strength should be selected for each pot.

E. riparium is an old favourite; with attention to stopping, compact, bushy plants may be had. It has dark stems, and rather small, deep green leaves, and produces a mass of bloom. Cuttings of all the Eupatoriums root freely, and, if put in about March or April, will make good plants the same season, which will be far more satisfactory than keeping any old plants over. As soon as sufficient cuttings have been secured, the old plants may be thrown away to make room, which is always wanted in the spring. A second batch of cuttings may be obtained from the tops of the young plants. H.

Owing to the early season, Daffodils (Narcissus) of several kinds are now coming in freely from the Scilly Isles, and elsewhere, and the price consequently rules low. The Tenby Daffodil (N. obvallaris), "Stella," and others of this class are among the most noticeable.

Gard. Chron., 1902

Obituary.

JAMES BATLEY.—The death of the above-named gardener, at the ripe old age of eighty-two, took place on May 11 at the Gardens, Wentworth Castle, near Barnsley. The whole of his working life was spent in the services of the Vernon-Wentworth family, owners of the Wentworth Castle estates. For over forty years he was head gardener, having succeeded his father in that position. Some years ago Mr. James Batley had to resign his position from failing health, the family very kindly giving him a pension. At that time his son, Mr. George Batley, the present gardener, was his father's successor. It is an event worth noting that three generations of gardeners served the same family for a large portion of the past century. The writer of this note well remembers being sent by the late Mr. Law, gardener at Wortley Hall, in Yorks, with a note to Mr. Batley asking him to accompany him to Trentham to get the dimensions of some upright ridge and furrow Peach-cases, then much thought of by Mr. Fleming, gardener at Trentham—this was in 1857. If I remember rightly, it took two days to do this, though probably not more than 70 miles distant. As a sound, practical gardener of the old school, Mr. Batley was one of the very best. Very fine crops of fine fruit, both of Grapes, Pines, and Peaches, were annually produced at Wentworth Castle, or Stainborough Hall, as it is more familiarly known in Yorkshire. Like many more men with real horticultural grit, Mr. Batley was content to remain in what may be termed the background of gardening. All the same, he was a most intelligent, well-read, and well-informed man on all subjects connected therewith. The oaken casket that contained his mortal remains was made from timber grown on the estate where his life had been spent. I ought to mention that Mr. Batley had artistic tastes of no mean character, as some of his oil paintings will testify. *H. J. C.*

THE GARDENS OF COLONEL PLATT, C.B., AT GORDDINOG, LLANFAIRFECHAN.

Interview with Mr. James Baxter.

IT was my good fortune, during July, to visit two notable gardens in North Wales. First, I asked Colonel Platt to allow me the opportunity of seeing Gorddinog, and, receiving a most cordial answer, I travelled to Carnarvonshire in order to spend a few hours in one of the loveliest demesnes in that lovely county. Situated a couple of miles from Llanfairfechan, one of the most charming watering places on the coast, with mountains behind and sea in front, Gorddinog has been richly endowed by Nature, and the owner has obviously spared no effort to maintain and enhance its attractions. One of the chief of these claimed my attention immediately on my arrival.

"Yes," said Mr. James Baxter, the gardener, who showed me round, "the rockery on the slopes is one of the features of Gorddinog, though at this season of the year you do not, of course, see it at its best."

"You mean that some of the most decorative plants have done blooming? But there remain so many in flower that gaps are scarcely apparent. What is the aspect of the rockery, and is any system observed in planting?"

"The aspect is due north, and with respect to planting the rockery, which was made sixteen years ago, Colonel and Mrs. Platt prefer the free and easy style. Schemes and formalism have no place in the gardens, but we do our best to make and keep them beautiful."

"As we go along, will you kindly tell me the families which you value most highly, taking the plants first, and the shrubs—which so immensely add to the effect—later?"

"In addition to the families, I will mention some of the rarer plants. With respect to those whose flowering season is over, the dwarf Almond—Amygdalus rana—is beautiful in spring. Then, there are the Aubrietias, which are represented by Bridesmaid, Dr. Mules, Fire King, græca, Moerheimi, and Prichard's A1. These are all good, and give a wealth of colour for some weeks. Aubrietias should be cut back after flowering, to ensure healthy flowering growths for the following season."

"Campanulas seem to be strongly in evidence?"

"The varieties are fragilis, garganica and g. hirsuta, isophylla, muralis, and pusilla. The Alpine Phlox is also well represented by divaricata, Laphami, Daisy Hill, lilacina, Newry Seedling, and Seraph; and members of the Primula family include Cockburniana, farinosa, japonica, rosea grandiflora, Sikkimensis, and pulverulenta."

"You must also have a great variety of Saxifrages?"

"We depend upon Fergusoni, Guildford Seedling, oppositifolia, o. alba, Wallacei, Clibranii, peltata, umbrosa, and pyramidalis."

"I notice that you make good use of your walls."

"Wherever we can get anything to do well we grow it. There are varieties of Erinus, which seed themselves freely on the walls, namely, alpinus, a. albus, and a. carmineus. Arctostaphylos alpina is very good for a wall garden; so is Linaria alpina, and old walls suit the silvery foliage of Artemisia brachyphylla, splendens, and sericea."

GORDDINOG, LLANFAIRFECHAN.

"You might point out some of the subjects which flourish in a shady spot."

"One of the best is Corydalis cheilanthifolius. Daphne blagayana flourishes in semi-shade, and moist ground. For a shady nook, Haberlea rhodopensis is admirable; and Mertensia virginica is specially good in cool, partial shade."

"Do you grow some plants for the sake of the berries?"

"Yes, particularly Gaultheria trichophylla, which has the double advantage of being rare and of yielding purple berries. Margyricarpus Setesen is a pretty, rare, creeping evergreen, with white berries, which are persistent in winter. Frankenia cævis is uncommon, and one of the prettiest of trailing plants is Hipponepis cornosa. In an effective situation, Magnolia stellata is hard to beat; Parochetus communis has charming indigo-blue flowers, but it requires moist, peaty soil; Hutchinsia alpinus thrives in sandstone, and Hellipene Saleirotti is a small, evergreen, carpeting plant for wet spots. For free flowering, Gentianas acaulis, asclepiadea, and verna, have to be frequently repeated."

Treatment of Soil.

"Before you pass on to the shrubs, I should like to know how you manage to obtain such good results with the plants. Is the soil congenial?"

"No; the staple soil surrounding the rockery is poor and dry. We have frequently to transplant many of the subjects, introducing in the process soil suited to their needs. Copious watering is given in dry weather. This is the general treatment."

"I need not ask if some shrubs do well, as, for instance, the Brooms."

"The Brooms, especially præcox—other varieties are Daisy Hill, Dragon-fly, and Firefly—are very much at home; so are Azaleas Alphonse Lavalle and Anthony Koster. All the dwarf sorts of Cistus flourish, and Eupatorium Weinmanniana is hardy here, and flowers profusely."

Lovely Flowering Shrubs.

"Speaking of profuse flowering, what is the shrub whose bushes resemble heaps of snow in the distance?"

"Eurybia Gunnii. Solanum crispum is another beautiful flowering shrub. Buddleia auriculata is very fragrant. Corokea cotoneaster is a rare and curious bush. The number of flowers of Desfontainea spinosa is quite remarkable. One of the best autumn-flowering plants is Escallonia floribunda; we have E. sanguinea also. Eugenia lignei is an uncommon shrub, resembling a Myrtle. Veronica Hulkeana is splendid under a sheltered wall."

"But all your Veronicas are magnificent."

"Yes, the bush Veronicas do well in the open, and are effective. Other successful shrubs are Carpentaria californica, Ceanothus Gloire de Versailles, Choisya ternata, Cotoneaster horizontalis (good for autumn colour), Garrya elliptica, Leycesteria formosa, Olearia Haastii and ilicifolia, and Spartun lanceum."

Deciduous Shrubs.

"We ought to add some of the most thriving of the deciduous species."

"These include Berberis Thunbergi, Helenia tetraptera, Fuchsia gracilis and Riccartonii, Hydrangeas hortensis, Philadelphus sanguineum, S. atrosanguineum and speciosum, Spiræas and Weigelas in variety, and Viburnum plicatum

Original from CORNELL UNIVERSITY

and tomentosum. The most highly appreciated of the numerous Heaths are Erica stricta carnea, mediterranea alba, glaucus, and hybrids, and vagans alba, pallida, and rubra."

Then, having observed that Roses play an important part in the ornamentation of the rockery, particularly Rambling Rector, a good old white variety, and some of the crimson and pink varieties, we strolled into the woods beyond, which form a grand background to the gardens, descending subsequently, and pausing for a moment at the Lily pond and fountain adjacent to the house.

Colonel Platt's Favourite Conifers.

"The creepers on the mansion," continued Mr. Baxter, "which was built, all but the loggia, about forty years ago, are Escallonias, Roses, Ampelopsis, Garrya, and a rare variety of Cistus."

"You have some fine specimens of Abies," I said, as we crossed over a rustic bridge, with a water garden in the making.

"Especially A. ajanensis, Brewayana, Engelmannii, excelsa aurea, Menziesii nigra, omorica, Smithiana, and Tsuga Albertiana. Other Conifers which are making good growth in different parts of the grounds are Cedrus atlantica glauca and Deodara aurea; Larix europea, leptolepis, and siberica; Picea amabilis, brachyphylla, bracteata, firma, grandis, and sachalienensis; and a Wellingtonia gigantea over eighty feet high. Colonel Platt's interest centres in the Conifers, and Mrs. Platt is most fond of the flowers. We are now passing through a little garden which is planted with bulbs, the Rose arch consisting of Blush Rambler. The next feature at the far end of the gardens is the Rosery, though you will observe rock plants wherever you go."

"What is the variety of Penzance Sweet Brier, of which you have such a delightful break just here?"

"Lucy Bertram. Others are Amy Robsart, Anne of Geierstein, Green Mantle, Jeannie Deans, and Meg Merrilies."

Tropæolum and the Yew.

"And how do you get the glorious scarlet mass that I can see some little distance off?"

"You mean the Tropæolum speciosum, which was planted at the bottom of a Yew tree, and has now climbed up nearly to the top. Yews and Hollies, of which we have twelve golden and green varieties, do wonderfully well."

"Likewise, I think, your climbing, rambling, and pillar Roses, whatever their form, or their combinations. It would, perhaps, be convenient at this point to refer to the herbaceous borders, which form another most attractive feature in many parts of the gardens, with the charm of being planted in an informal manner."

The Herbaceous Borders.

"They extend to a total length of one thousand five hundred yards, and were formerly very narrow. In recent years they have been widened, which entails a large amount of extra labour in staking and other details. The aim is to secure as extended a season of bloom as possible. Something of interest is usually to be seen in the borders from January till Christmas."

"How do you begin the year?"

"It is heralded in with Primroses, and closes with late Chrysanthemums. The principal planting in the intervals are Delphiniums Anthemus and E. C. Buxton; Erigeron glaucus; Phloxes; Chrysanthemum maximum in variety; Lilium candidum and others; Spiræas of sorts; Calceolarias; Roses, bush, pillar, and standard; Geranium pratense; Helleborus, hybrid Sweet Williams, and Pentstemons."

"Which at present make a great blaze of colour."

"Pentstemons are no trouble at all, so long as they get a good soaking now and again. The main borders on either side of the carriage drive look their best in the spring, the effect of the various bulbs which then make their appearance being heightened by the grass paths. There is yet another feature outside which will complete your description of the flowers."

Mr. Baxter then led the way towards one of the kitchen gardens, and the ranges of glass. Here, under one of the walls, was a border, in which large, informal groups are grown to flower in October.

"It would be very useful," I remarked, "to have the names of varieties which yield quantities of bloom in North Wales as late as October."

"You may begin with Pentstemon Newbury Gem, and Dr. Hogg. Aster Robert Parker also flowers in October, and amellus bessarabicus, likewise A. ericoides and A. cæsius. The Chrysanthemums flowering in the border include Horace Martin, Mrs. J. W. Scott, Madame Desgranges, Sœur Melaine, and Ambrose Thomas. Other plants are Hollyhocks, Calceolaria amplexicaulis, Lobelia cardinalis, Antirrhinums Sutton's Orange King and White Queen of the North; Pyrethrum uliginosum, Galtonia candicans, Schizostylis coccinea, and late Peas."

"What about Sweet Peas generally?"

"We merely grow a number of standard varieties, but do not make a feature of them."

Fruit Under Glass.

"How many houses are there?"

"Fifteen. They are chiefly fruit houses, though in the stove we have a few Orchids, and a certain number of Malmaison Carnations are grown."

"The Vineries seem to be on a large scale."

"We grow in the different houses Black Hamburgh, Muscat of Alexandria, Canon Hall, Lady Hutt, Mrs. Pince, Alnwick Seedling, Appley Towers, Alicante, Muscat Hamburgh, Madresfield Court, and Lady Downe. In the Peach houses the varieties are Royal George, Violet Hative, Rivers' Early York, Crimson Galande, Sea Eagle, and Gladstone. The Nectarines are Lord Napier, Elruge, Victoria, Humboldt, and Pineapple. The Peach season lasts from June till October, a few late varieties being grown on the walls outside. Here is a house devoted entirely to Runner Beans. They are planted in the borders, not in pots, and we pick them daily for three months."

Proceeding presently to the larger kitchen garden adjoining Mr. Baxter's residence, I saw

THE ENTRANCE TO THE ROCK GARDEN, GORDDINOG.

THE ROCK GARDEN, GORDINNOG.

Generated on 2015-02-04 10:59 GMT / http://hdl.handle.net/2027/coo.31924094256181

a quantity of outdoor fruit, and very large stretches of vegetables.

"The Pears," he said, "which do well out of doors are Beurre d'Amanlis, Beurre Diel, Beurre Easter, Beurre Hardy, Beurre Rance, Bon Chretien, Doyenne Boussoch, Doyenne du Comice (the best Pear), Glou Morceau (good near the sea), Jargonelle, Josephine de Malines, Knight's Monarch, Louise Bonne of Jersey, Marie Louise, Olivier de Serres, Pitmaston Duchess, Souvenir du Congres, Thompson, Winter Nelis, Bergamotte d'Esperen, Chaumontel, Beurre Clairgeau."

"And Apples?"

"The best dessert varieties are Mr. Gladstone, Lady Sudeley, Devonshire Quarrenden, James Grieve, Ribston Pippin, Cox's Orange Pippin, Adams' Pearmain, Annie Elizabeth, and Magnum Bonum. One of the best bearers of kitchen varieties is Cox's Pomona, and one very prolific, Stirling Castle. The small fruits consist of Strawberries, Raspberries, Gooseberries, Red, White, and Black Currants; of the Black, Boskoop Giant, and of the Red, Lee's Prolific are most esteemed."

Vegetables All the Year Round.

"Do you grow vegetables throughout the year to serve the establishment?"

"Yes, and the abnormal drought has made the task this season severe. But, notwithstanding the weather, Peas have been up to the present time very good. For gathering early in June, a good selection of the old variety, William I., is still relied upon, owing to the fact that it can be sown as early in January as the state of the soil will permit. Gradus gives a good succession, but this variety cannot, as a rule, be sown outside with safety before March. Other standard varieties grown are Daisy, Duke of Albany, Telegraph, Dickson's Lord Lieutenant (a grand maincrop), Fillbasket, and Autocrat. Ne Plus Ultra and Canadian Wonder are our chief Dwarf Beans, but for climbers we have Veitch's Climbing, Dickson's Excelsior, and Champion Longpod, which all give satisfactory results. Dickson's Superlative Red and White Celery and Mathless White are our only two varieties. The latter has been of invariably good quality, and most reliable."

"How many years have you been at Gorddinog?"

"Seven years."

ALFRED WILCOX.

THE gardens of Mr. J. B. Joel, at Childwickbury, St. Albans, will be described next week.

The Amateur's Frame.

XII.—TOMATOES IN A COLD FRAME.

IT is quite possible to have a good crop of Tomatoes in a cold frame, though necessarily they are not so early as if grown in a greenhouse, where they can be assisted with heat. Certainly, in the germinating stages the seeds need heat, and for some time afterwards the seedlings are benefited by it; but even for this we can still be true to our frame, for the hotbed will be a splendid place for germination and for after-growth, until they can be safely put into a cold frame. Before giving an outline of Tomato culture for frames, it may be well to see how our frame is to be fitted for their reception.

Preparing the Frame.

Until the time for planting arrives, there will be no need to make any alterations in the frame, for whilst in pots the plants can stand on the ordinary ashed, shingled, or trellised bottom, such as was figured last week. The plants are to be set just inside the frame at the lower end. In the case of a span-roofed frame, they could well be planted on either side. About nine inches from the wood of the frame a board is set on end, so as to enclose a space nine inches deep by nine inches wide. Over the ashes or shingle at the bottom of this enclosure, let a layer of leaves be spread, and covered by a couple of inches of soil. The plants are then turned out of their pots, and set in place, so that the soil can be put around the ball and duly firmed.

If the frame be eight feet wide, and be divided by the usual rail, it will be well to set three plants in each. This would allow the end ones to be eight inches from the side and from the rail, and each sixteen inches from the middle one. This will be a good distance, affording plenty of root-room, room for the free expansion of foliage, and for getting to the plants for purposes of tying, disbudding, etc. The method here shown involves the erection of something on which to train the growths. This would need to be at least six inches from the glass.

Training the Plants.

A good method would be to drive a staple into the frame where each Tomato is set, both at the top and the bottom, and to connect them

THE TOMATO FRAME.

tightly with wire. To this the main stem could then be securely attached. A thick piece of tarred string would serve the purpose, though not so well, for however tightly it is tied, there is sure to be a slackness afterwards, caused by the weather. Other means of setting wires, strings, canes, or sticks, will readily suggest themselves, but personally I prefer this method.

Speaking of training from the cultural point of view, it need only be said that the single stem system is advised, all laterals being pinched as soon as they can be handled, and the top growth being nipped off when it has reached the limit of space allotted to it, or when a sufficient number of trusses has set on the plant. Even in the case of the lean-to form of frame it would be possible to place a row of plants also at the back, and train them to meet the others.

Top-dressing the Plants.

In the method of planting which I have described, provision is made for top-dressing the plants, and increasing the area of root-room. It is recognised that restriction of the roots and firmness of soil are two essential factors in producing sturdy and fruitful growth. Hence a width of nine inches is allowed at first, and a depth of soil just sufficient to cover the balls of the plants. When the plants are making good headway, and are setting their fruits, and when also the soil is seen to be permeated with roots, the board in front is moved three inches further from the plants, and the space is filled with soil, a little also being added at the top. Later the plants may be set back another three inches. This method of top-dressing is shown in the accompanying illustrations.

For planting in frames, seeds should be sown in a box or a pan towards the end of February, and be placed in the hotbed frame. When the first signs of the rough leaf appear, the seedlings should be pricked off into a box. The next stage will be transference singly to 3-in. pots, and later to the 5-in. size, from which they can be planted into the frame.

Hardening the Plants.

In all cases the plants should have become well rooted before any shift is made. The planting into the frame will then happen about the middle of April. As soon as possible the young plants should be inured to cool treatment, but they must be well protected from frost.

It is especially advised, whatever the soil, that there be no sort of dung or chemical manure put in with it at the time of pricking off, potting up, or planting out. Tomatoes are known to make very vigorous growth, and if they have a rich soil, their fruit will not set well. After the first or second truss has set, then feeding with liquid manure or by means of top-dressing may be done.

A Diary of Tomato Culture.

I now give a brief diary of Tomato culture as they have been actually grown in a normal year. The dates need not be strictly adhered to, but they will serve as a reminder.

February 15th.—Sowed seeds in hotbed.
February 21st.—Seedlings appear.
March 3rd.—Pricked off seedlings into box two and a half inches apart.
March 20th.—Potted plants into 3-in. pots and put in cooler quarters.
April 6th.—Shifted plants to 5-in. pots.
April 28th.—Planted in frames.
May 13th.—Tying and training the plants.
June 8th.—Top-dressed as already described.
June 26th.—Cutting out some of the foliage to shed light on the fruits.
July 6th.—Picked ripe Tomatoes.
July 28th.—Again top-dressed the plants.
September 8th.—Stripped all leaves off to ensure ripening of fruit.
October 4th.—Cut out the plants.

The Illustrations.

Fig. 1 shows section of a frame planted with Tomatoes as described in the text.

Fig. 2 shows where the Tomatoes are to be set, and the distance apart according to the scale. The dotted lines represent strained wires on which the plants are trained.

Fig. 3 shows how the board is shifted back for top-dressing in two stages, with a little soil added to the top on each occasion. A is the first top-dressing, B is the second.

WILLIAM F. ROWLES.

VENUS'S Fly-trap (Dionæa muscipula) is a greenhouse plant which, though of no great horticultural value, is interesting from its method of supplying itself with nitrogen. The leaf is margined with small spines, and on the upper surface are glands, and three or four long, hair-like growths. When a fly or insect touches these hairs, the leaf folds over, enveloping the victim, and the glands discharge a copious secretion, which aids the plant to digest the food thus provided. The plant belongs to the Sundew or Drosera family, and grows wild in swampy ground in some of the warmer parts of North America.

Mr. Stocking. We need hardly say that deceased was highly respected by all who knew him, and he was widely known through the county.

The funeral took place on Thursday, the 8th inst., in Didlington Churchyard, attended by Lord Amherst of Hackney, the *employés* on the estate, and many others from distant parts of the neighbourhood.

PRESENTATION TO MR. JOHN BAXTER.

ON Thursday evening, Nov. 8, Mr. John Baxter, who has been forty-one years gardener on Colonel McCall's Daldowie estate near Glasgow, was presented with a handsome walking-stick, bearing a suitable inscription, and a well-filled purse of sovereigns (and Mrs. Baxter with a handsome umbrella) in recognition of his long and much-appreciated services. John Mair, Esq., Mount Vernon, occupied the chair, and the gathering embraced many old friends. Mr. Baxter is retiring through the considerate kindness of Colonel McCall.

As his career as a gardener covers the most interesting period of Scottish horticulture, a brief sketch of it will be welcome. He was born in Dunblane in 1836, educated in the parish school, and at the age of ten years was awarded a prize for repeating the "Shorter Catechism"! He must have been a "lad o' pairts" to be able to do this. At the age of thirteen he was sent to work in the garden of Sir William Maxwell, of Keir, and remained there for seven years. He recalls to this day with much interest the fact that at the time there were three pensioners employed in the famous gardens who were at Corunna, Waterloo, &c., and who often fired his youthful enthusiasm with many tales of battles. When nineteen years of age Mr. Baxter went thence to Edinburgh Botanical Gardens, and remained two years, being paid 11s. per week. In those days Dr. Neil, Cannonmills Cottage, had a famous collection of alpine plants, and Mr. Baxter was permitted to visit the garden, he also had the opportunity of meeting De Quincy, who had a weird and far-away look. Mr. Baxter's uncle was De Quincy's publisher. When twenty-one years of age Mr. Baxter went as inside foreman in the gardens of the Earl of Kintore, at Keith Hall. When twenty-three years of age he was appointed to Daldowie, and has been gardener there ever since. Roses, Antirrhinums, and Verbenas, which were much better then than now, were in turn taken up by Mr. Baxter and thoroughly well cultivated. Hollyhocks, Dahlias, and other flowers came in for much of his attention from time to time, but the name of Baxter has been inseparably associated with Violas for the last twenty years. As an exhibitor his greatest triumph was perhaps winning the principal prizes at the Glasgow International Exhibition in 1888 against the leading Scotch nurserymen. As a raiser his fame rests securely on such choice varieties as Blue Cloud, Duchess of Fife, Gipsy Queen, White Duchess, York and Lancaster, Princess Ena, and some others.

Mrs. Baxter has been a true helpmeet to her husband during all the long time they have been at Daldowie, and they are followed into their comparative retirement at Uddingston with the good wishes of "troops of friends." *William Cuthbertson.*

HOME CORRESPONDENCE.

THE BRITISH OAK.—The accompanying photograph [not reproduced. ED.], is one of a number I had taken for a certain purpose about eighteen months ago. It represents an average park Oak-tree. At the time, I did not know what variety it was, the tree being leafless, but two days ago I visited the tree again, to be sure on that point, and from the samples of acorns herewith sent, you will see that it is a well enough marked pedunculata, while the photograph of the tree itself answers (as regards general habit and appearance), almost exactly to the description given of the sessile Oak in the *Gardeners' Chronicle* of Sept. 22, as follows:—"In the sessile Oak, there are more boughs than in the pedunculate; they are smaller, more horizontal, and much more ramified than in the latter tree. The sessile Oak usually retains a strong leading shoot later in life than the pedunculate one, and this is extremely useful in its competition with Beech. The foliage is more uniformly distributed over the crown of the tree, and protects the soil against the desiccating effects of the sun's rays much better than that of the pedunculate Oak. The leaves of the sessile Oak are on petioles about an inch long (fig. 62), and consequently the supply of water they receive from the wood of the twigs is restricted in quantity, while, owing to the diffuse ramification, the latter obtain less water from the roots of the tree." Further, you will see by the leaves sent, how unreliable, minute, and particular descriptions are in determining varieties, let alone species, for the shoots sent have pedunculate acorns, and the leaves have the petioles of sessiflora—fig. 62 p. 219, showing that all the so-called distinguishing marks get mixed up in endless variations. The tree shown is growing in a naturally rather dry soil, under which the coal has been scoped out a few feet below long ago, yet it is in fine health, though perhaps 200 years old, and is one of the "squat but sturdy Oaks" that Sir Walter Scott drew his descriptions from, in Ivanhoe. I suggest, that in a discussion of this kind, descriptions of our native trees be taken from our own forests, and not from French sources. As

JOHN BAXTER.

regards soil and situation, referred to by "B." in a former issue, my experience is that all the forms of our common Oak thrive less, and grow quickest, in a fairly moist soil and sheltered situation, and that none of them "prefer" an exposed situation or dry soil. Under such conditions they become stunted. Almost any ordinary soil seems to contain sufficient food for the Oak, but even in rich soils the broad-leaved forest-trees grow slowly, and soon become stunted if the soil be thin and suffers from drought. The food is there, but the roots cannot get hold of it for want of sufficient water in the soil. *J. Simpson.* [To our eyes the photograph sent represents Q. pedunculata, and the leaves and acorns are of that form also. ED.]

OAKS AT CHATSWORTH.—As one who visited Chatsworth in August last with the English Arboricultural Society, I have been much surprised at the statement made by Prof. Fisher, that the Oaks he writes about are growing on mountain limestone—this he repeatedly asserts. I cannot claim to be a professor, but I could easily discern that the ground gone over by the English Arboricultural Society at Chatsworth was a moorland soil on the millstone grit. With reference to the two Oaks, Quercus sessiliflora and Quercus pedunculata, I think it would be very poor forestry indeed to plant any kind of Oak on a light dry soil, and certainly no forester with anything like a proper knowledge of his profession would ever think of doing it; and this is apparently the idea held by Mr. Robertson, as in all the young plantations on this class of soil seen at Chatsworth, Beech and Sycamore were the principal hardwoods used, with a result that spoke for itself. I should like to hear Mr. Robertson's opinion on the subject, as I am sure he could definitely inform us if there was any difference in the growing of the two Oaks at Chatsworth, but I understand he has not yet recovered from a severe illness. *Scots Fir.*

SUNFLOWERS AS A FIELD CROP.—Can any farming correspondent kindly inform me whether Sunflowers for seeds have ever been grown successfully, or at a profit, anywhere in the British Islands? We know, of course, that they have been grown on small areas, during hot seasons, with success so far as seed for poultry and pheasant-feeding are concerned, but the question now is, whether Russian or South European Sunflower-seeds cannot be purchased cheaper than we can grow them in our dull and moist climate. As oil-yielding seeds, Sunflowers are extensively grown in Russia, and large quantities of the best seed is eaten by the peasantry, and are sold in the streets of all large towns. Whether or no the Sunflower can be grown successfully as a crop in Britain, it seems likely to be extensively tried in the colonies, where soil and climate are alike suitable, and there is a demand for cheap vegetable-oil. In India it is being tried by the Government of Bengal; and the Consul-General at Odessa says, in a recent report, that its cultivation in Russia is rapidly extending since mills have been erected on the spot to express the oil; and growers are obtaining better prices than they formerly gained by exporting the raw seed. Seeds are sown in April or May, after all danger of frost is over, about 20 lb. of seed per acre being used, and the yield on good land is 1500 to 1600 lb. or more per acre. The yield in oil is 17 per cent. from seed in the husks, to 20 per cent. from husked, or shelled seed. We have experimented with the Giant Russian Sunflower this year, and the plants grew 10 feet high, with enormous flowers, some of the seed-heads being a foot in diameter, and yielding large, plump, and well-flavoured seeds. Apart from the use of the seeds in feeding poultry and game, or even cattle as made into "oil-cake," there seems to be an opening for their use in cooking, either in the shape of seeds or of oil; and as the seeds are pleasant in flavour and very nutritious, they might, like Melon or Gourd-seeds, be utilised along with sugar in sweetmeats or confectionery. *B.*

RUDBECKIA GRANDIFLORA.—I am glad that my note disparaging R. fulgida, which you did me the favour to print on p. 329, has already borne good fruit. Mr. Burrell has sent me from Cambridge a flower and leaf of a plant from North America, which he has lately been distributing as R. fulgida, but which is undoubtedly R. grandiflora (Gmelin), a species as far superior to R. speciosa as that plant is to R. fulgida. Though gathered on November 2, and called "a shabby specimen" by Mr. Burrell, it is more than 5 inches across, with twenty broad rays fully 2 inches long, resembling R. speciosa except in size. It is described in Asa Gray's *Flora of North America*, vol. i., part 2, p. 261; and the only portrait I have seen of it is in Sweet's *British Flower Garden*, series ii., tab. 87. This portrait seems to have been taken in the year 1830 from a plant introduced from North America the year before by Nuttall, and called by him R. nudicaulis (Persoon). Sweet calls it Centrocarpha grandiflora. How long after 1830 it continued in cultivation in England I do not know, but I think it was extinct in 1860, and has only recently been re-introduced. It is native of Arkansas and Louisiana, and I fear will not remain long in gardens where the soil is cold. It is said to prefer "dry plains." *C. Wolley-Dod, Edge Hall, Malpas, November 3.*

LEPTOSYNE GIGANTEA.—It may interest some of your readers to know that the fine Californian Composite so well illustrated in the *Gardeners' Chronicle* for November 3, 1900, p. 319, under the above name, is identical with what is portrayed on plate 6241 of vol. 102 of the *Botanical Magazine* as Coreopsis or Tuckermannia maritima. What is usually grown under this name is quite a different plant, with much smaller flowers, the correct name of which I have not yet ascertained. *W. E. Gumbleton.*

THE WEATHER IN NORTH CORNWALL—The total rainfall here during October amounted to 3·76 inches; there were thirteen rainless days, and the greatest fall during twenty-four hours was ·63 inches, measured at 9 A.M. on Thursday, October 4. The barometric pressure has been uneven, the lowest reading being 29·32 inches at 1 P.M. on the 4th, and the highest 30·64 inches at 12.45 P.M. on Monday, October 22; this is the highest reading recorded since March 13 last, when it was exceeded by ·06 inch. The temperature as registered by a

The past season has seen the introduction of several novelties, and these include some fine American varieties, both hardy and tender. Among the hardy kinds, Nymphæa William Falconer, intense light garnet, is pre-eminently the largest and richest dark-coloured variety in cultivation. The stock of this variety is limited, and will command a high price for some time. Nymphæa gloriosa is one of the very best of French introductions. It is of the Marliacea type, colour rosy to dark carmine, a very symmetrical, full flower. Nymphæa Aurora, yellow to carmine; Nymphæa andreana, beautiful red and orange; Nymphæa lucida, an exquisite variety, rosy vermilion, outer petals light rose, are all worthy novelties. A number of French varieties are variable in colour, changing from light to darker colours; such are very pleasing, even fascinating.

MR. JOHN BAXTER.
(A raiser of beautiful Pansies.)

Nymphæa William Doogue is a superb, massive flower, colour a very pleasing soft pink, very highly esteemed. Nymphæa William Stone, a hybrid of N. gracilis, has flowers 8 inches to 10 inches across, violet-blue shaded amaranth; flowers open all day and first-rate for cutting. The list of new varieties grows rapidly, but it is gratifying to note the advancement and the improvement along this line, especially new and unique colouring which a short time since was inconceivable.

The general advancement in the line of culture is very noticeable. Many who made a trial with a few tubs have arrived at a stage when, by experience, they find that a tub 22 inches to 24 inches in diameter is by far too limited a space in which to grow a good Water Lily. They are not content with small or moderate flowers or such plants after seeing the large specimens in public and other gardens where Nymphæa leaves are to be seen 20 inches to 22 inches across, and flowers 10 inches to 15 inches in diameter. More common-sense methods are now adopted in the culture of aquatics. A few years ago running water was considered necessary, or there would be stagnation, malaria, mosquitoes, and other pests, but this fallacy has long since been dispelled. Plant-life in the water oxygenates and purifies the water as do plants and trees the air we breathe, and fish destroy insects, so running water is no longer advocated by practical cultivators.

Now that the season is over, although drawn out unusually late, and numerous flowers are yet to be seen, it is full time that all plants required for stock should be housed, or everything in readiness for security against a sudden fall in temperature. After the first freezing, or even after a period of low temperature, it will be wise policy to remove them to safer quarters.

Where hardy varieties are in water of sufficient depth to be below freezing they will need no further protection, but where choice hardy varieties are grown in an artificial pond and it is necessary to draw off the water to preserve the masonry, the best way, or a very good way, at least, is to dig up the plants and pack them pretty closely together in a box and place this in a pond in water of a sufficient depth to be secure against freezing. If no such pond exists the roots may be packed closely together in a tub and covered with water and kept in a cold house, or even sunk in the ground and covered with boards, covering these in turn with leaves and litter. The tender varieties that have flowered freely all summer are difficult to keep over unless they can be placed in a tank or shallow pond in the aquatic or other house, where they can be kept in a quiet state, not growing yet not cold, so as to lose all leaves, uch conditions to continue until the days lengthen. Where no tanks are available, and the resources of a greenhouse are at command, then, after the plants are nipped by frost, trim off most of the leaves and roots and remove the stool with a fair amount of soil around it and plant it under the bench near the walk; give a good soaking of water to settle the soil and keep the leaves in as fresh a condition as possible for a time. It will be unnecessary to give another watering. Let the plants, with the tubers attached, if any, dry up. The central crown will surely die, but the side shoots will ripen good tubers. An examination may be made after a few weeks, and where the roots and leaves or leaf stalks have decayed the soil may be pressed in and around firmly, but the main thing will be to keep them dry, and yet not so dry that they will shrivel. In this condition they may remain until spring. These remarks apply to all the night-blooming varieties that form compound tubers, but not to the Zanzibar and other African or blue Water Lilies, unless they are small plants in from 4-inch to 6-inch pots. Plants in these sized pots can be readily placed in a tub of water under the bench.

Nelumbiums in tubs must be protected against freezing. Either sink them in the ground and protect, as before recommended for Nymphæas, or keep in a cool house where they will not freeze. Where growing in an artificial pond it will be prudent to protect the masonry where frost is likely to be severe, remembering that the Nelumbiums are safe only as they are below the frost-line. Musk-rats must be hunted down and destroyed if you value your Water Lilies.—WM. TRICKER, in *The American Florist.*

Rosa alpina.—This is the species from which the Boursault Roses have been derived. The stems are 4 feet to 5 feet high, and have few or no spines except when young. The flowers are rosy red, the fruits red, often Pear-shaped, and covered with bristles.

WORKERS AMONGST THE FLOWERS.

MR. JOHN BAXTER.

WE are very pleased to give a portrait of this good Scotch gardener, who, as we mentioned in THE GARDEN lately, has recently retired on a pension from the service of Colonel McCall, Daldowie Estate, near Glasgow. We cannot, however, let such an occasion pass without referring to Mr. Baxter's good work amongst a class of flowers precious to all who treasure their gardens. Pansy Blue Cloud, Gipsy Queen, Duchess of Fife, and White Duchess, varieties of beautiful and distinct colouring, were raised by Mr. Baxter, and it is not too much to hope that in his retirement he may be enabled to carry on more ardently his interesting work of raising beautiful things for our pleasure grounds. Mr. William Cuthbertson, of Rothesay, N.B., kindly sends the following note:—

"You ask for a few lines about my old friend Mr. John Baxter, lately gardener to Colonel McCall, Daldowie, near Glasgow, and now of Clydeview, Uddingston. What can I say more of him than that he was in the same situation for forty-one years, and retired from it a few days ago full of years and of honours? It is not given to many men to be forty-one years in one place—and what do these years represent? Springs, summers, autumns, winters, the care of a large garden, and withal a constant, assiduous attention to florists' flowers, and an eye and mind ever open on the world at large. Such was Mr. Baxter's busy life on its public side; on its private side, the father of seven sons, brought up to positions of credit and honour.

"Friends in the district of Daldowie have recently made presentations to Mr. and Mrs. Baxter, and the West of Scotland Pansy Society are going to do likewise, as a recognition of his long and able services to horticulture.

"Like a true gardener, Mr. Baxter was ever willing to obtain information and acknowledge the same from which it came; but, on the other hand, few men I have met have been more tenacious of their own opinions. The late Mrs. McCall took a deep interest in the garden when Mr. Baxter went to Daldowie, and she had studied Roses in sunnier climes than ours, and many sensible hints on Rose culture Mr. Baxter acknowledged he got from her. He remembers quite well the first time the Rose Géant des Batailles was shown in Scotland and the sensation it caused. It was shown by Mr. Philp, of the Royal Hotel, Bridge of Allan. Antirrhinum Hendersoni Mr. Baxter grew in pots in a greenhouse shortly after it was sent out, but he never could get a single seed to germinate, and during all these years he says 'there is none better of the same type,' and he is right. When he first grew Viola Magpie I have heard him say he could not get it to seed, and only once got three seedlings from it; although he grew hundreds of plants, these three were the veriest pygmies, and not one of them spotted. In a recent letter from Mr. Baxter is written: 'Now, Cuthbertson, I must get up my spirits, and endeavour to practice the motto I saw carved on a sundial—aged and green—when I was a boy, and he must have been a cheery spirit who coined it, "I count the bright hours only." In my day the country has made great progress in commerce, and in mechanics and science, and it is pleasant to think that the gardening fraternity has in no way lagged behind. Think of Roses, Dahlias,

Chrysanthemums, and Violas, but you know all about them.'

"As a raiser of many choice Violas Mr. Baxter will long be remembered.

"WILLIAM CUTHBERTSON."

A LADY HORTICULTURIST.

Two of the most enthusiastic of Scottish amateur gardeners are Her Grace the Duchess of Roxburghe, whose gardens at Floors Castle, near Kelso, I have, through her kindness, visited twice; and Mrs. McDouall, of Logan House, Kirkmaiden Parish, Wigtonshire, whose beautiful residence, with its picturesque environments of wood and water, of garden and lawn, is not more than six miles distant from this manse. Mrs. McDouall is a daughter of the late Sir Thomas Hepburn, of Smeaton Hall, in Haddingtonshire, who was, like herself, a lover of Nature and a cultivator of Orchids and other precious tropical flowers. Her husband, the late Mr. McDouall, of Logan, was also fond of gardening, while his father, Colonel McDouall, was a renowned agriculturist, and made the desert, by his influence and unvarying activity, blossom like the Rose. This lady is a lover of such wild flowers as the Woodbine, the Campion, the Eglantine Rose, the wild Geranium (G. robertianum), and the profusely flowering, fragrant Scilla nutans, which luxuriate in the woods that environ Logan House. Much of her time is spent in the gardens, in which almost every flowering plant is discoverable that is worthy of cultivation. It is not long since this earnest Scottish lady horticulturist contributed to THE GARDEN a record of her experiences with the culture of Oriental and Occidental Lilies. Like the Duchess of Sutherland, she is a great admirer and constant cultivator of those majestic flowers. The imperial Eastern Lily is the empress of the garden in their estimation, if the Rose is the queen. Mrs. McDouall has been very successful with Lilium auratum, and especially with that grand variety entitled Platyphyllum, which has occasionally attained at Logan to a height of 8 feet, crowned with a veritable affluence of richly coloured flowers of imposing dimensions. Other forms of Lilium auratum are grown in situations formerly occupied by peat-loving Azaleas and Rhododendrons, midway between the garden and the Mansion House. Other Lilies of commanding beauty cultivated at Logan House are the great Lilium giganteum of the Himalayas, which last year was 10 feet high; L. Humboldti, L. speciosum, L. longiflorum, L. candidum, the beautiful Madonna Lily, which, however, occasionally decays; L. tigrinum splendens, and the new American hybrid L. Burbanki. The Almond tree was recently introduced into her gardens with finely artistic results in early spring, while almost every species of fruit is carefully and successfully cultivated, both in the open garden and under glass, including the Vine, the Peach, the Nectarine, the Guava, the Apple, the Cherry, the Pear, and the Plum, all of these combining beauty with utility; but the lady of Logan is chiefly enamoured of her flowers. The long herbaceous border is during the flowering season extremely attractive, and the collection of Roses of every possible description is very extensive. It was in Logan gardens that I first made the acquaintance of such beautiful Hybrid Perpetuals, not yet quite superseded, as Duke of Edinburgh, Beauty of Waltham, Duke of Wellington, Charles Lefebvre, and Baroness Rothschild. Among modern varieties three of Mrs. McDouall's supreme favourites are Margaret Dickson, Papa Gontier, and that exquisite French Hybrid Tea, Mme. Pernet Ducher, which, while always admirable, is especially fascinating when in bud or half blown. The spacious conservatory is full of rare exotics, and the walls of the garden are adorned with Tropæolum speciosum, T. canariense, various richly effective white and purple Clematises, and other climbing flowers. The present proprietor of Logan, Mr. Kenneth McDouall, while inheriting his gifted mother's taste for gardening, is also deeply interested in arboriculture.

DAVID R. WILLIAMSON.

Kirkmaiden Manse, Wigtonshire.

THE FLOWER GARDEN.

CHOICE SAXIFRAGES.

EARLIER in the year some interesting notes appeared concerning one or two important species of this group, and notably S. burseriana with its varieties. These, however, I will in the present note avoid as much as possible, preferring to touch more generally on those that, as a rule, are not selected for individual praise. I have found that not a few kinds are infinitely more safe in partial shade, where the great heat of summer does not reach them, than is usually supposed. This much I state without hesitation, and as the outcome of considerable practical observation. I have no doubt, however, there are exceptions in this as in all else, and that instances may be found as directly opposed to this as it is possible to be.

It was stated in THE GARDEN quite early in the present year as an essential to the pot culture of these plants that they must be protected by frames if they are to pass the winter successfully. I took exception to the statement in some notes, as not a few of the many choicer species may be grown and wintered entirely without a frame, or, indeed, any covering overhead at all. One of the chief factors in the summer culture of these plants, then, is shade, shade of a considerable nature, and coupled with a very liberal supply of moisture. This latter may be modified in proportion whether the plant is plunged or not, or whether growing in deep, light, or heavy soils. In any case a plentiful supply of root moisture is very essential, not only to success, but often to the life of the subject itself. I remember loose banks of light soil disposed at an angle of 40° or more that have for some years contained several choice and pretty species that have to be replaced frequently owing to their dying off. It is easier to grow the more diminutive kinds in pots. The soil can then be prepared, and as the summer heat advances the plants may be removed to a place of shelter. I believe it was Mr. Leonard who asked the question as to whether any one had permanently grown the rarer kinds without protection, and as in some way an answer to this I brought the plant shown in the accompanying picture to the Drill Hall. This plant I have had under my care for at least fourteen years, during the greater part of which time it has been exposed winter and summer without even being plunged. It is not an isolated case, for the lovely Boydi is quite near, as also apiculata in giant patches, Burser's Saxifrage, juniperina, salmonica, and others. All these have stood years of winter wet and frost, and still flower with great freedom.

The charming plant illustrated is Saxifraga aretioides primulina, the colour a deep primrose-yellow. I obtained the plant, then quite a small one, for which I was most grateful, from my very old and esteemed friend, Mr. W. B. Latham, of the Birmingham Botanical Gardens. Many there are who know the kindness of this able curator, and my little testimony to this is that Mr. Latham cut his only plant in two parts purposely to give me the one, and I think the largest one. This portion was then about the size of a halfpenny, while as shown recently at the Drill Hall the perfect cushion-like mound of the tuft alone would be about 6 inches at least, the centre of the mound being fully 3 inches high. Of the mass of blossoms, the picture, kindly photographed by Dr. A. Dashwood-Howard, Hampton Hill, will give an idea. The density of the flowering, however, in some degree detracts from the rosette-like character of the growth, which is only visible in the lower part of the picture. The inflorescences are about 3 inches high, and the strongest usually have five flowers each, so that its flowering continues for quite a lengthy period. The variety was raised by the late Mr. James Atkins, of Painswick, but I am not sure of the parents, which may be aretioides with apiculata, the latter having given it somewhat of its size of blossom and equally of its colour, while the type would reserve to itself the habit. It is worth noting that the flowers are much larger than in the type or in the white variety of aretioides. I have always considered good drainage an essential, as also potting the plants very firmly in loam, old mortar and sand, with a little manure, the latter always very old. By keeping the growth in mound-like form, and tightly compressed together, I find but little difficulty in dealing with any of the more minute kinds. It is a different matter, however, when one sees the tiny rosettes lying loose and straggling hither and thither on a scrap of soil continuously dry, for then success is usually a long way off. In growing these dwarf and almost miniature kinds it cannot be too well known how freely they root from the base of the rosette, and how deeply these tiny root fibres will descend. At the same time, this rooting is the more readily performed where firmness

SAXIFRAGA ARETIOIDES PRIMULINA (FLOWERS DEEP PRIMROSE-YELLOW).

plants were Bromus unioloides, H.B.K., and Festuca bromoides, L. As usual, the fungus formed a black mass in the ovary of the host plant, and proved to be a new species — Cintractia patagonica, Cooke, and Massee. Quite recently a traveller in these regions observed that Bromus unioloides was extensively grown, mixed with Lucerne for fodder. Seed of the Bromus was brought home and sown in Lincolnshire, and on producing fruit was observed to be attacked by the Cintractia. The above illustrates one of the methods by which injurious fungi are introduced from one country to another, and unless great care be taken to stamp out the newcomer, it is just possible that we may eventually have to add another cereal fungus-pest to our already large list."

NATIONAL CHRYSANTHEMUM.

THE CLASSIFICATION COMMITTEE.

AT a meeting of the above Committee, held at the Royal Aquarium, Westminster, on October 7, Mr. Norman Davis, Framfield, was elected Chairman of the Committee.

It was resolved that the following two varieties, Lily Mountford and Hilda Chamberlain, be bracketed as synonymous in the Society's list as "too-much-alike" Japanese varieties. That the following be bracketed as synonymous in the list of too-much-alike early-flowering varieties, Harvest Home and Cranford Beauty. That the following Pompon varieties, Martinmas, La Vierge, and Vesuve, be transferred from the early-flowering Pompon section, to the early large-flowering section. It was further resolved that the heading in the Society's Catalogue "Japanese Early Flowering Varieties," be altered to "Large Flowering Early Varieties," so as to include all types except Pompons. That a new class be added to the Society's Catalogue now in course of compilation, to embrace market and decorative varieties other than early flowering.

MONDAY, OCTOBER 27. — A number of interesting novelties challenged the attention of the above Society on the above date, but owing to the lateness of the season, the rush of new varieties is not so heavy as is usual; in another fortnight a considerable number may be anticipated.

Additions to the incurved section are now so few that a fine variety is always warmly welcomed, such an one is—

Cecil Cutts, a seedling raised by Mr. H. Weeks, Thrumpton Hall Gardens, Derby; this variety was seen last year, and admitted to be promising, it has now developed into a large, full, symmetrical flower of a deep yellow colour, and it is distinct from any other that we have. First-class Certificate to Mr. T. MUDD, Thorneywood, Nottingham. Another new incurved is Madge Cray (Seward), a good sized flower, with a pinkish-salmon base and yellow centre; a little rough as shown, but likely to be seen in better character later on. From Mr. W. SEWARD, The Firs, Hanwell.

First-class Certificates were awarded in almost every case unanimously to the following Japanese varieties:

Miss Olive Miller. — The surface of the petals pale purplish-mauve; the reverse silvery-pink, the long twisted florets incurving so much as to make the surface of the flower exposed to view, silvery. A full deep flower f a most attractive character. From Mr. GEO. MILEHAM, The Gardens, Emlyn House, Leatherhead.

Miss Mildred Ward.—Said to be from a cross between Pride of Madford and Madame Carnot, and intermediate in colour between Charles Davis and Lady Hanham. Of the build of Madame Carnot, the prevailing tint, a pinkish-salmon. A good addition to the Madame Carnot group. From Mr. T. BULLIMORE, The Gardens, Canons Park, Edgeware.

George Penford (Penford).—A rich crimson flower, with a reverse of gold. It may be described as a glorified Edwin Molyneux, bright, both on the surface and reverse; large, full, and extra fine.

Florence Penford (Penford).—Yellow, with a delicate amber reverse, a flower of charming character; and an incurving Japanese, with long curling florets. Both from Mr. Chas. Penford, The Gardens, Leigh Park, Havant.

Decorative variety Ryecroft Beauty, of a pretty shade of lilac-pink, dwarf and very free, was commended. From Mr. H. J. JONES, Ryecroft Nursery, Lewisham.

Early flowering Gladys Gray, a bright yellow sport from Edward Le Fort, was shown by Mr. WILLIAM GRAY, florist, Thorngumbald, Hull. The flowers were small, being from the open ground in that cold district; but they would no doubt come much finer in the South (Vote of Thanks).

Mr. W. J. GODFREY, nurseryman, Exmouth, had a batch of his new varieties, though not one of them obtained an award. The most fancied were Mr. H. Emmerton, an Australian variety, clear yellow, darker in the centre; F. S. Vallis, which was thought to be too much like G. J. Warren; Exmouth, very bright; Duke of Devonshire, yellow with pencilled lines of crimson, and Wilfrid H. Godfrey, and Grandeur, two of the fine crimson varieties Mr. GODFREY has produced.

Mr. H. PERKINS, The Gardens, Greenlands, Henley-on-Thames, had Japanese Miss Smith, a large white variety in the way of Mutual Friend; and Henry Perkins, pale orange-crimson flower.

Mr. G. SHAWYER, Cranford, Hounslow, had a plant and blooms of his market variety, Queen of Yellows.

BECKENHAM HORTICULTURAL.

"THE Growth and Cultivation of the Misleto" was the subject of a paper read by Mr. W. Groves, Grove House, Shortlands, October 24. For a quarter of a century, Mr. Groves has made Misleto a matter of special study, and he has proved by careful observation and experiment that Darwin was wrong in assuming that the seeds passed through birds before germinating on their host. Birds took the berries for the viscid substance surrounding the seeds, which was pleasant to the taste. The seeds themselves were very often rejected, the birds wiping them off their beaks on the trees. The seeds, if swallowed, being so thinly coated could not pass the gizzard of a bird undigested; this had been proved by experiment. Quite recently Mr. Groves had discovered that having gorged themselves with berries, birds often vomited the seeds. The branch of an Apple-tree containing a number of seeds germinating was shown to illustrate this. The paper throughout teemed with interesting facts relating to fertilisation, propagation, and the growth of this interesting parasite. One remarkable fact was, that although it would flourish freely on the Apple, Pear, Lime, Whitethorn, Poplar, &c., the best results were always obtained when transferred from one host to another of the same species.

Mr. G. N. Hooper, F.R.G.S., occupied the chair. He thought a census of the gardeners in Beckenham might be taken, for not only could the Church House be filled, but the Town Hall likewise. *M. W.*

THE LATE JOHN BAXTER.

BIRMINGHAM GARDENERS'.

OCTOBER 20.—At the meeting of the Birmingham Gardeners' Association on the above date, a paper on "The Evolution and Improvement of Fruit" was read by Mr. R. Lewis Castle, Manager of the Woburn Experimental Fruit Farm. Reference was made to the wild forms, from which it is probable our principal Pears originated, and specimens were shown of some in contrast with the best varieties of modern times. The methods of work, and the results accomplished by the leading fruit-raisers were described, and the directions in which to proceed for further advances were noticed. Under the head of Improvement of Fruits, hints were given on cultivation, selection, seed-raising, &c.

SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.

MR. C. HARMAN PAYNE was, on Saturday last, the guest of the above Society, of which he is one of the most respected members, and which he joined when it was quite in its infancy. Mr. Payne's labours on behalf of the French raisers of Chrysanthemums, were graciously acknowledged some five years ago by the Government of the French Republic, who bestowed upon him the honour and title of *Chevalier du Mérite Agricole*. On the occasion of his recent elevation or appointment to the rank of Officer of the same Order, the members of the French Society decided to present him with a miniature officer's cross, and the presentation taking place on Saturday evening last, at the Society's Rooms, 64, Long Acre, W.C.

The meeting, which on this special occasion was limited to the staff of the said Institution, and a few personal friends of the new officer, had the character of a social gathering. It was held under the chairmanship of Mr. G. Schneider, who, in the name of the titulary members of the French Society, and with a few appropriate words, handed the gift to Mr. Payne, who, in a few well chosen sentences, full of international sympathy, acknowledged it, and graciously thanked the staff of the Society and the company, for the honour done to him.

Messrs. T. Bevan, B. Wynne, and Percy Waterer, having also added their share of praise towards the new officer, and recapitulated the services he has rendered to French and English horticulture, the proceedings terminated.

Mr. C. Harman Payne has the honour of being the first Chevalier of the *Merite Agricole* of British nationality.

LIVERPOOL FRUIT & ROOT SHOW.

OCTOBER 25.—The thirteenth annual show was held in the North Haymarket on the above date, the Lord Mayor, Alderman Charles Petrie, performing the opening ceremony. Lord Derby and his son, the Hon. Arthur Stanley, M.P., made a tour of inspection, and expressed their delight at the work of the committee.

The show of Potatos was imposing, and visitors could not fail to derive benefit from the splendid examples sent from all parts, and many prizes were awarded for Kidneys and Rounds in white and coloured varieties. Special prizes were offered by Messrs. Sutton & Sons, Reading; Messrs. Webb & Sons, Stourport; Messrs. Fidler & Sons, Reading; and Mr. J. Niven.

The show of roots and vegetables was superb, and for special and other prizes there was keen competition. The four special prizes fell to Mr. MACKARELL, with Ribston Pippin, Beurré Hardy, Warner's King, and Pitmaston Duchess; Muscat of Alexandria from Mr. B. ASHTON, was adjudged the best dish of fruit.

Messrs. Dicksons, Ltd; Gartons, Warrington; Fidler, Reading; Middlehurst, Liverpool; W. Ker & Co., Liverpool; and others contributed effective stands.

Obituary.

JOHN BAXTER.—This much respected florist died on the 23rd ult., at the age of sixty-six. He was forty-one years gardener on Colonel McCall's estate of Daldowie, near Glasgow, and it was while located there he did his life's work in the way of improving the Viola. In this connection his name will long be remembered and cherished. On November 8, 1900, Mr. Baxter was the recipient of a handsome presentation, and in our issue of November 17, 1900, an account is given of the meeting at which it was made, along with a portrait and sketch of his career.

DAVID SAUNDERS.—There passed away, after a week's illness, on Sunday morning, October 12, at a comparatively early age, David Saunders, senior partner of the firm of Messrs. Michael Saunders & Son, nurserymen, Friar's Walk, Cork; and of him it may be said that in matters relating to Roses, fruit trees, and Conifers, he will be greatly missed. There was scarcely a horticultural exhibition of any note held south of Dublin during the last thirty or thirty-five years at which he was not present, and at the same time the soul and life of the numerous friends he met on this occasion. "Friendship is but of slow growth, and never thrives unless engrafted upon a 'stock or scion' known of reciprocal merit." Of him it may be said he well deserved the appellation, for never did he allow a gardener out of place to want for work while he could employ him; and that precious virtue of being charitable to the needy, combined with a forgiving spirit, were amongst his more prominent attributes. He was laid to rest in the new cemetery at Cork, on Tuesday, the 14th, followed to the grave by many of the citizens. He leaves a widow and a numerous family, and the business will be carried on as usual by his eldest son, assisted by his foreman, Mr. Hawker.

TRADE NOTICE.

DISSOLUTION OF PARTNERSHIP.—The firm of John Laing & Sons, Nurserymen, Forest Hill, has been dissolved by mutual consent, and the business will in future be carried on by John Alexander Laing.

Spathiphyllum Minahassæ, Tetranema mexicana, and Tupistra nutans.

Greenhouse.

Among other things the following are very noticeable: Abutilons in variety, Begonia coccinea, B. echinosepala, Calceolaria Burbidgei, Chrysanthemums in variety, Plumbago capensis, Salvia azurea, S. splendens var. grandiflora, and Tecoma Smithii.

Rock Garden and Herbaceous Ground.

Aster cordifolius, A. diffusus, A. ericoides, A. horizontalis, A. tartaricus, A. Tradescanti, A. turbinellus, Baldwinia uniflora, Chrysogonum virginianum, Lobelia urens, Polygala Chamæbuxus var. rosea, and Primula japonica.

OBITUARY.

C. MARIES.

THROUGH the sudden demise of Mr. C. Maries, which occurred on October 11, at Gwalior (India), horticulture has lost one of its most energetic members, and one who, during the few years which were devoted by him to plant collecting, enriched the European collections with many plants of great value. He was in the employment of Messrs. James Veitch and Sons, when, in 1876, he was entrusted with a mission to explore part of China, Formosa, and Japan, with a view to introducing into Europe some representatives of the splendid vegetation which was known, or was only supposed to exist, in these countries, and especially in the great Ichang Valley. Mr. C. Maries succeeded in sending home and in good condition such plants as Platycodon grandiflorum Mariesii, Rodgersia podophylla, Abies Mariesii, Styrax Obassia, Pteris longifolia Mariesii, Hamamelis mollis, Hydrangea Hortensia Mariesii, and the charming H. Hortensia rosea which deserves a much more extended cultivation than it receives at present. He also reintroduced the long-lost and very pretty Caryopteris Mastacanthus and a host of other plants of equal merit. His success in introducing these plants is all the more remarkable if we take into consideration the difficulties with which collectors had to contend in those days of comparatively slow navigation, and was mainly due to the care, and, I may add, also the ingenuity he displayed in the packing and forwarding of these plants to which he was so devoted. Later he was appointed superintendent of the Gardens of Durbhungah, and ultimately of the magnificent gardens of Gwalior, where he made some very extensive alterations and improvements during the many years that he had them under his direction.

That Mr. C. Maries had well employed his time, and that his exertions were well and duly appreciated, is evident from the fact that, besides being an occasional contributor to the gardening papers and to the Journal of the Royal Horticultural Society, he was also a fellow of the Linnean Society, and was one of the recipients of a Victoria Medal of Honour. To his widow, his son, and his daughter we offer our deepest sympathy.

JOHN BAXTER.

THE death is announced of Mr. John Baxter, who retired exactly two years ago from the service of Colonel McCall, Daldowie, where he had been gardener during the previous forty-one years, and since his retirement had resided at Uddingston, near Glasgow. For many years Mr. Baxter had been intimately associated with Violas as a raiser of the best varieties, and also as a chief exponent of their cultivation. Though latterly Violas had been his favourites, other florists' flowers, such as Dahlias and Hollyhocks, had received much of his attention from about the year 1860 onwards. As a young gardener his time was passed in the famous Keir Gardens, near Stirling, and the Edinburgh Botanic Gardens, under McNab, then to the Earl of Kintore's, passing thence to Daldowie at the early age of twenty-three. The late Mr. Baxter had reached the age of sixty-six at the time of his death. An account of Mr. Baxter's career and life work appeared in THE GARDEN, December 8, 1900.

THE LATE MR. JOHN BAXTER.

MY GARDEN PATH.

THOU say'st, "Not ugly is the garden of thy choice,
Yet thou in solitude appearest to rejoice;
The pathway is so narrow, there is no room for two
To wander side by side, in converse sweet and true."

In solitude? Oh, no! There's ample room, I think,
When *friends* together walk, and arm in arm doth link;
Oft have I wandered so—and never yet alone—
The dear one by my side, my arm around her thrown.

Before us or behind a little child can play,
And sometimes in between us gently make its way;
While, if on either side we chance the hedge to touch,
'Tis but the fragrant Roses who in play our shoulders clutch.

The pathway thus for me quite broad enough has been—
The only road to joy that I have ever seen.
For formal visitors alone it is not amply wide,
And I with such should never wish to wander side by side.

E. M. M.

—(From Rückert's "Weisheit des Brahmanen.")

THE EDITOR'S TABLE.

VIOLET PRINCESS OF WALES.

From Mr. Osmond G. Orpen, Hillside, West Bergholt, Colchester, we receive a delightful gathering of Princess of Wales Violets grown quite in the open. The flowers are large, most deliciously scented, and a splendid dark violet colour. The footstalks are quite 12 inches long, and the leaves remarkably vigorous. No one who once has seen this Violet, now generally recognised as the finest of all, will care to be without it. Such charming flowers from the open in October are very welcome.

A SEEDLING ASTER.

Mr. A. R. Upton, the Guildford Hardy Plant Nursery, Millmead, Guildford, in sending a seedling Michaelmas Daisy, writes: "The Aster which I am sending you is a seedling from my Compton Heath Nursery, and is now infull bloom. It is about 3 feet high, and a strong grower. So far as I know it is quite a new variety, and such a good colour so late in the year should be valuable. I should be interested to hear your opinion."

[The flowers sent are certainly of a very good distinct colour, quite a pretty blue-purple, and they are very freely produced.]

AUTUMN FLOWERS.

Mr. James Page, Knoyle Gardens, Salisbury, writes: "I am sending you a few flowers cut from outside borders, showing the mildness of the season. Lobelia cardinalis, Montbretias, Dahlias, Marguerites, Roses, &c., are all looking well. The Rose is Mme. Isaac Periere, both standards and bushes are full of good bloom; in fact, quite equal in colour, form, and scent—if not better—than we get them in June. One standard at the present time is carrying eighteen flowers expanded and expanding and thirty-two buds just opening. I think it is one of the best autumn-flowering Roses. I can cut—not one or two, but scores two or three times a week. It does especially well here both as a standard and bush on its own roots."

[A delightful gathering of autumn flowers.]

DIPLADENIAS.

Mr. J. Glasheen, The Retreat, Cam, Gloucestershire, sends a few blooms of Dipladenias in several lovely colours. These are amongst the most beautiful of stove flowering plants, and no one with a house sufficiently well heated should be without them. Mr. Glasheen says: "It is surprising when one considers their rich colours and their long flowering period that Dipladenias are not more popular. In combination with Allamandas, Gloriosas, Schubertias, &c., they have made a brilliant display on the roof of the stove house here since the beginning of July."

ASTER "THE GARDEN."

Mr. Amos Perry, Hardy Plant Farm, Winchmore Hill, N., sends us a gathering of Michaelmas Daisies in many beautiful sorts. They are striking testimony to the value of Michaelmas Daisies as autumn flowers. Mr. Perry says that owing to the cold nights the flowers are not so good as they would otherwise have been. That named in compliment to THE GARDEN is a new one, distinct from any other by its remarkable pyramidal habit, the spikes of flowers measuring fully 3 feet in height, the whole plant growing about 5 feet high. The long slender side shoots will render this variety very useful for cutting, and the colour, a good deep purple-blue, is very pleasing.

NOVEMBER FLOWERS FROM WORCESTERSHIRE.

Mr. Arthur R. Goodwin, The Elms, Kidderminster, kindly sends a gathering of autumn flowers, picked on November 3 from the open garden. They comprise Gentiana acaulis, Saxifraga Fortunei, Erodium pelargonifolium, Gypsophila Rokejeka, with pale pink flowers, and Chrysanthemums George Wermig and Mme. la Comtesse Foucher de Cariel. Mr. Goodwin says "the first-named Chrysanthemum is very late this year. The latter is almost the most beautiful outdoor variety I know, habit, foliage, and flowers being perfect. The Saxifrage always does well in a fine autumn, and is grown here on a north rockwork in shade."

[The Chrysanthemum Mr. Goodwin speaks so highly of is a splendid colour, a rich bronze buff, and shows well what delightful plants these free-flowering Chrysanthemums are. No one should be without them, for together with Michaelmas Daisies they are responsible for much of the autumn beauty of gardens.

Oxford Dictionary of National Biography

Baxter, William (1787–1871), *botanist*
by Giles Hudson
© **Oxford University Press 2004–14** All rights reserved

Baxter, William (1787–1871), botanist, was born at Rugby on 15 January 1787. Nothing is known of his parents or early life, except that his mother was said to have been born in Hill Morton near Rugby. In 1813 he was appointed curator of the Oxford Physic Garden. At the time of his appointment botany in Oxford had, it is widely reported, sunk to a low level and the then professor, George Williams (1762–1834), was generally more highly regarded as a scholar than for his practical contributions to botanic science or to the teaching of undergraduates—a responsibility that was passed down to Baxter along with the practical management of the garden. During Williams's time Baxter made many improvements to the garden, not least of which was the raising of its whole level by 10 inches so that it was no longer subject to regular flooding. However, it was after Williams's death in 1834 and the appointment of Charles Daubeny (1795–1867) to the professorship that most progress was made, with the garden being completely rearranged according to a new scheme.

Not unexpectedly perhaps, given the state in which he first encountered the garden, Baxter's chief interest was in cryptogamic botany, and in 1825 and 1828 he issued his ‘Stirpes cryptogamae Oxonienses’ which consisted of some 160 dried specimens of ferns, mosses, lichens, and microscopical leaf fungi found in the neighbourhood of Oxford. His efforts were not restricted to these plants, however. He undertook much fieldwork in and around Oxford, recording the discovery of many new plants in the area, and in 1831 he visited Rugby with his son for the same purposes. As well as contributing to regional natural histories by other authors with whom he was in correspondence—*Midland Flora* by Thomas Purton (1768–1833) and *Flora of Oxfordshire* by Richard Walker (1791–1870) among them—Baxter published his own work under the title *Phaenogamous Botany, or, Figures and Descriptions of the Genera of British Flowering Plants*, in six volumes between 1834 and 1843. It was a handsome work, containing over 500 hand-coloured plates and including many verses.

Baxter was made an associate of the Linnean Society of London on 6 May 1825 and was a member of the Botanical Society of London. He was also a chief mover in the founding of the Oxford Botanical and Natural History Society, which was formerly established under the presidency of Daubeny on 31 August 1831 with Baxter as its secretary. No record remains of Baxter's marriage, but in 1851 when he retired from active management of the botanic garden a son, William Hart Baxter (1816?–1890), who had previously held the position of curator of the botanic gardens in Bath, took over. For the remainder of his life, Baxter did little which brought him into public notice and at the time of his death, at his home, 7 Longwall Street, Oxford, on 1 November 1871, he was almost unknown to contemporaneous horticulturists. He was, however, despite reportedly being susceptible to periodic attacks of mental depression, remembered as a man for his ‘amiable disposition, his great knowledge, his extraordinary memory, and his willingness to oblige’ (*Gardeners' Chronicle*), not to mention the extensive botanical library which he left and which during his lifetime was regarded as the most complete of any British gardener.

20 to 15.75. If, therefore, the price of the nitrate of standard purity is fifteen shillings per hundredweight, a fair price to pay for the sulphate of twenty per cent. purity would be about seventeen shillings and fivepence per hundredweight. As to which of the two to use, there can be no doubt that the nitrate is the better

MR. OSBORN BEAL.

for dry soil, because it has the power of absorbing moisture from the atmosphere, and thus tends to keep the ground damp. For wet land the sulphate of ammonia should be preferred.

Sunshine in the Orchard.

April 4th.—The further north we go, the more important it is that plants should have as much sunshine as possible, and for that reason the favourite position for fruit trees in Scotland is, as in the Clydeside orchard shown in the illustration, the southern slope of a hill. There is then some chance that the fruit may get the bright colouring which is so important for market purposes, and which is rarely seen when the sunshine is deficient. There, even more than in the South, it is essential that the centres of the trees should be kept open. No crowding must be allowed; all superfluous shoots must be cut away. I should think that the American system would be admirably adapted to Scotland. It is very simple, consisting merely of training up seven or eight strong, well-placed branches, and spurring them in close, like espaliers. The whole energies of the trees are thus concentrated on these seven or eight branches, and the fruit which they carry, the result being that, though the crop may be smaller than it would be if more wood were allowed to grow, it is more regular, and the fruit is finer and better-coloured. This system would seem particularly suited to certain varieties of Pears. In an article written last year by M. A. Ville, it is stated that, in damp and shut-in situations, the fruit of delicate varieties like Beurré d'Hardenpont, Royale d'Hiver, and Bon Chrétien d'Hiver, is inclined to rot, and that thick and bushy forms of these trees should therefore be avoided. In connection with cordons, the same writer recommends that, in the case of very strong growers, the branches should be trained horizontally, and that, in the case of very weak growers, they should be trained vertically. This seems rational enough.

The American Wood Lilies.

April 5th.—Plants that will thrive under trees are often asked for, and to those generally suggested I would add the Trilliums, or American Wood Lilies. There are over a dozen different species, some in flower at the present time. The best of them is T. grandiflorum. Anyone who would see what a fine plant it is for growing under trees should pay a visit in about a month's time to the Royal Horticultural Society's gardens at Wisley. Each stem bears three leaves in a whorl, and issuing from the centre is the flower, white at first, afterwards changing to pale rose. The stems spring up from thick rhizomes, and the plant may be propagated either by division or by seed. I cannot find the seed in any catalogue, but there are sure to be some firms which can supply it. Another species, T. erythrocarpum, has its white flowers striped with purple, and bears red fruit later in the season. In T. nivale the flowers are pure white. The flowers of another species, T. erectum, have an objectionable smell.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 257.—MR. OSBORN BEAL, AT THE GARDENS, BASSETT WOOD, HAMPSHIRE.

A FIRST place must be given among gardens within easy distance of Southampton to those of Mr. J. R. Anderson, at Bassett Wood. Approached from St. Deny's station by a pleasant road, the drive from the entrance to the mansion is five furlongs long, and is extremely beautiful, shrubs of many kinds being a conspicuous feature. On the sunny afternoon in March when I visited the place, the view from the drive was charming, and I soon found that all through the hundred or so acres covered by gardens and woods, there are picturesque and delightfully natural elements. Mr. Beal, the head gardener, being at the time of my arrival in one of the houses, we started with the contents, which included a nice piece of Cymbidium Lowianum, with sixteen flowers on one spike.

"I may explain," said Mr. Beal, "that the principle here is to grow a little of everything, rather than large quantities of few things. Thus, we go in for a few Orchids, chiefly Cœlogyne cristata. At the same time, we try to get, as far as possible, masses of colour. Here are some Primulas which I am saving for seed, plants of Sutton's grandiflora. From this strain a better variety of colour is obtainable than from the old strain."

"I see that you have a number of Cacti?"

"They are some of Veitch's hybrids, I believe, and the varieties include Jessica, Brilliant, Agatha, Gordoniana, Cyrus, Homer, Cooperi, Thania, and Alatis. In the natural order of things they will be in flower in another month. The shades of colour are mainly brilliant scarlet, light flesh, crimson, and white. They are very fine, but the flowers only last a short time."

"Is that the reason why they are not grown more extensively?"

"Yes, I should think it is. People do not, as a rule, care for flowers which are so ephemeral. But the cultivation of these Cacti is not very difficult. I grow them in a good deal of brick rubble, give them a season of rest, and then expect them to flower. They have been in a pit all the winter."

Lachenalias and Violets.

"You also go in for Lachenalias?"

"Yes, between three and four dozen; but they are just dying off. The varieties are Nelsonii and tricolor. The former cannot be excelled. Lachenalias continue in flower for a month in the conservatory."

"Violets," continued Mr. Beal, "are rather

THE ROCK GARDEN AT BASSETT WOOD.

a feature. At this period of the year Lady Hume Campbell is one of the most useful varieties, and W. W. Astor is the most distinct. It does well also out of doors, and so does Marie Louise. The Violets outside last as well as those in the frames, but the advantage of the frames is that you can pick bunches at any time. Strawberries are also largely grown inside and out of doors. We force Royal Sovereigns in pots, and have them in the open; also Viscountess, which is useful for preserving."

Fuchsias and Pelargoniums.

"Perhaps while we are at the houses we had better finish with them?"

"In the Vinery we grow all Muscats save one rod of Black Hamburgh; and, as you see, Peaches are grown on the back wall, the varieties being Waterloo and Crimson Galande, and Lord Napier Nectarine. In the other Peach house, also, we grow Lord Napier Nectarine, and Princess of Wales Peach. A good many things are grown in the houses for the perfume. Staphelia colchica is grown for this purpose, and is very useful for cutting. After the plants have done flowering, they are put out."

As we proceeded, Mr. Beal called my attention to the herbaceous border under the Pear wall, after I had previously observed St. Brigid Anemones beginning to make their appearance on the outside Vinery border.

Nigella Miss Jekyll.

"This border," he said, "which is arranged in clumps of three or five plants, contains a good collection of Oriental Poppies, the Giant Thrift, Irises in variety, Montbretias, Alstrœmerias, Echinops, and Campanulas in variety. On the wall are newly-planted Peaches—Noblesse, Dr. Hogg, and Princess of Wales, the Nectarines, Pineapple and Early Rivers, and also some nice pieces of Ceanothus. A plant which does exceedingly well here, and of which we grow a batch, is Nigella Miss Jekyll. It wants very little attention, and is best sown and thinned out. It remains in flower for six weeks or two months. We like it so much that we sow three times. Just in this sheltered spot I have planted three young Apricot trees (Moor Park); they are making strong wood, and are clean."

"You appear to have done a lot of planting lately?"

Bassett Wood and Lawn.

"You have some Tree Carnations?"

"Not a great number, but the varieties have been carefully selected, and include Fair Maid, T. W. Lawson, Floriana, Flamingo, Lilian Pond, Nelson Fisher, Melba, Enchantress, Harry Fenn, Morning Glory, Governor Woolcott, and a good batch of Winter Cheer."

"How many Fuchsias and Zonal Pelargoniums do you grow?"

"About five dozen of each. The Fuchsias are Elegans, Wave of Life (yellow foliage), Phenomenal (purple and white), Florizel, Earl of Beaconsfield, Molesworth, Mrs. Marshall, and London Market, also the trailing one—F. procumbens, which is very pretty when in berry. The Pelargoniums include Colossal, Oliver, Lady Sarah Wilson, Duchess of Marlborough, Mark Twain, Madame Cherotte, Duke of York, General Roberts, J. H. Ardene, President McKinley, Lord Aberdeen, Countess of Jersey, W. E. Corden, Lady Malet, Miss G. Askworth, Silver Queen, Lady Roscoe, Octavia, Cerise, Phyllis, and Hurber Sharon."

"Do you make Chrysanthemums at all a special feature?"

"No, we grow about two hundred, and care more for the singles than for the big flowers."

"That has been one of the works in which I have been busily occupied since we came here two years ago. Generally speaking, we are doing away with all the old varieties, and planting new ones."

"The Black Currants under the south wall are not new?"

"Oh! no. They have been there a long time; but they are quite free from the mite, and crop very satisfactorily."

"You have still some Christmas Roses in flower?"

"We find the Helleborus a very useful flower during the winter. It begins to blossom here in November, and frequently continues until March, though we cut all the time. I think that probably one reason why it does so well is that it is planted in the centre of the garden. It will not thrive so well on an east border. We have chiefly one variety—niger. With regard to cultivation, we give the plants rather rich soil, mulch them after they have flowered, never dig round them, nor let them be disturbed."

"Tell me of anything else that does well in this kitchen garden."

"Near the Vinery is a specimen of a rare plant of Sparaxis, or, as it is now called, Dierama pulcherrima. At midsummer it throws up spikes five feet high, of sanguineous purple, the number of flowers being quite two dozen. In the same warm spot Belladonnas are quite established, and do very well. Near the Vinery we grow Sweet Peas, including new varieties, namely, Evelyn Byatt, Mrs. Alfred Watkins, Queen Alexandra, Henry Eckford, Dora Breadmore, and John Ingman. For early work we have Sweet Peas mixed with the Cupids in front."

"Is there anything more to note before we leave the kitchen garden?"

"Peas are rather a feature. The early varieties are May Queen and Defiance; Best of All, Prince of Peas, and Gradus, main crop; and Ne Plus Ultra, late. We grow three varieties of Onions, Sutton's White Glow, Reading, and Long-keeping."

An Ideal Tennis Court.

A short distance from the kitchen garden, and in a remarkably pretty situation, is a tennis court, which was completed only a few weeks ago, with a summer house at one side overlooking a bank one hundred and thirty feet long, of Wichurian and other Roses underneath.

"What are the varieties?" I asked.

"There are Universal Favourite, Pink Roamer, Gardenia, South Orange Perfection, and Alberic Barbier, etc. On one side of the tennis ground are about forty Thuja Lobbii, which I planted because they are always green in the winter, and form an excellent screen. On another side are early spring-flowering Rhododendrons, Andromedas just coming into flower, and the surrounding Coniferæ include a fine specimen of Wellingtonia gigantea, Cryptomeria elegans, Abies canadensis, and several very good examples of Cupressus."

The New Rosery.

We next inspected the recently-remodelled Rosery, in which turf paths have been substituted for gravel One of the features of the Rosery is a number of arches planted in pairs. I enquired the names of these.

"They are mostly Polyanthas; there are pairs of Farquhar, Fortune's Yellow, Crimson Rambler, Universal Favourite, moschata, Hermine Madele, Lady Gay, and Pink Rambler. In the mixed beds, some as standards, and others as dwarfs, are the best Hybrid Perpetuals, including Margaret Dickson, General Jacqueminot, Duke of Edinburgh, Gloire Lyonnaise, Mrs. John Laing, Heinrich Schultheis, Fisher Holmes, Le Havre, Madame Eugene Verdier, Auguste Guinoisseau, Lady Mary Fitzgerald, Caroline Testout, Eclaireur, Duke of Teck, Clio, Merveille de Lyon, Duke of Connaught, Frau Karl Druschki (the finest white), La France, Charles Darwin, Duc de Rohan, Prince Camille de Rohan, Annie Wood, Beauty of Waltham, Black Prince, Charles Lefebvre, Jeannie Dickson, Augustine Rigotard, and John Hopper."

"Of what section are the Roses in front facing the sundial?"

"They are all Teas, and are chiefly Goubalt, General Schablekine, Etoile de Lyon, Ethel Brownlow, Socrates, Madame Lambard, Marie van Houtte, Safrano, Maman Cochet (and the white variety), Madame Falcot, Isabella Sprunt, Souvenir de President Carnot, Bessie Brown, and Dr. Grille. Then there are the outside beds, one of which contains Rugosa Roses in the centre, with a border of Pinks (Mrs. Sinkins) and London Pride. In other beds are Azaleas—Fielder's White, and America (a rose colour), also Kalmia latifolia; and mention might be made of a fine specimen of Andromeda."

The Decoration of the Conservatory.

We then crossed the terrace in the front of the mansion (facing which is a very expansive lawn), to the conservatory, and here there was a very charming show of flowers. I noticed at

once an excellent display of Primulas, stellata, sinensis, and obconica; also a quantity of Cyclamen.

"We sow the Cyclamen," said Mr. Beal, "flower them one year, and then throw them away. You see that we have Acacias in two varieties, Drummondi and cordata; the latter is just opening in flower. It ought, I think, to be more grown. We treat it in the same manner as American plants. The Solanums are the capsicastrum variety, and the berries were ripe before Christmas. For conservatory work the Boronia megastigma, a very sweet-scented flower, is useful."

"The Genistas are a pleasant variation of colour."

"Yes, that is one of the objects in view, and the Genistas are now looking their best, while the Schizanthus are just over. The Cinerarias are Sutton's strain, and are chosen for their splendid colour. Another plant which is not turned to as much account as it might be is the Dicentra spectabilis (the Lyreflower, or, as some call it, the Bleeding Heart). The plants have been in flower for a fortnight, and will last a month longer. Mignonette has been in flower since Christmas, and you see that Cypripedium barbatum is also in flower. There are from fifty to sixty pots of Arum Lilies."

"How long have the Daffodils been in flower?"

"Three weeks. There are two varieties of Narcissus (Queen of the Yellow and Grand Monarque) already here, and we have coming on, Stella obvallaris, Minnie Hume, Burbidgi, Orange Phœnix, and Sulphur Phœnix. Hyacinths also are just coming on, the varieties being Charles Dickens, King of the Belgians, Baron van Thuyll, Grand Vedetta, King of the Blues, Queen of Whites, Pressman, and Korbach."

"What do you grow on the terrace?"

"Wallflowers, Polyanthus, and Forget-me-nots. In the new rock garden close to the house there are Ferns on one side, and on the other Saxifrage, Alpine Phlox, Aubrietias, Alyssums, Spanish Iris in variety, and Geums. But we have a much larger rock garden in another part of the ground."

The Azalea Garden.

On our way there I observed very fine specimens of Magnolia conspicua and M. purpurea, some fine clumps of Azaleas (Fielder's White), and some splendid Rhododendrons in clumps.

"This," said Mr. Beal, pointing to a specimen about twelve feet high, "is Eurya latifolia variegata, and is about nine to ten feet through. It is considered an exceedingly good specimen, and, in order to preserve it, we had to take down an overhanging Oak and Fir tree. But in the Azalea garden there are Rhododendrons all round, many of which are big specimens. There are two of the Himalayan varieties showing flower—pure white. One of the finest of Rhododendrons is Mrs. Holford (a rose colour), and others in different parts of the grounds are George Hardy, Pink Pearl, F. B. Hayes, and Mr. John Waterer. Between the Rhododendrons and the Azalea garden are Lilium auratum, L. umbellatum, and L. rubrum, Thunbergia elegans, and T. multiflora."

"Is there anything notable that we have missed on the lawn?"

"Yes, you have not noted the Arbutus unedo growing out of the stem of a Stone Pine. It has certainly been here a great many years, but we cannot understand how it gets its moisture. Pernettyas are quite at home in this soil, and are just showing flower, and, as you see, in various parts, Camellias thrive wonderfully. In the rock garden, which we are now approaching, is a Camellia, with a splash flower, which is one of the best. There are a number of varieties here, but we do not know their names."

"How long ago was this rock garden made?"

"Twelve months ago, by Mr. Ladhams, of Southampton. We have some of the best Water Lilies in the pond, including Nymphæa Robinsonii, N. Marliacea carnea, N. Fobili, N. Gladstonia, N. Ladykeri, and others. The Hawthorn-scented Pond Weed flowers well, and there is a very fragrant perfume from the Aponogeton distachyon. Here is a fine specimen of Phormium, a flourishing clump of Bamboo gracilis, a couple of Chamærops, which used to be in tubs, but are now planted out, and have stood the winter very well; and Phylesia buxifolia, a flower like a miniature Lapageria rosea."

"Then you have a new orchard?"

"It is outside the gardens, and is planted with the newer varieties of Apple trees, and on the north side are Damsons, all standards. The Apples include Newton Wonder, Gascoyne's Scarlet, Lane's Prince Albert, Bramley Seedling, Wellington, Blenheim Orange, Cox's Orange Pippin, Warner's King, and Bassett Beauty, which was raised at the Bassett Nursery. Now, I think I have told you all there is of interest."

"You have not told me anything about yourself?"

"There is very little to say. I have been with Mr. Anderson as head gardener between nine and ten years, at Heathside, Weybridge, and two years here. I was previously foreman at Weybridge Park for five years."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 244.—FLOWERS FOR THE AUTUMN, AND SPRING WINDOW-BOXES.

Dear Kate,—Every good gardener looks well ahead, and, although spring flowers are scarcely open, we must not forget the autumn months, which, in a herbaceous garden, are apt to be a little dull and lacking in colour after the gorgeous tints of June, unless special measures are now taken to ensure plenty of bright flowers at that time.

An Ideal Window for Window Gardening.

Early Chrysanthemums.

We are just ordering a few new early Chrysanthemums, in addition to those we already have, for these flowers are reinforced by new beauties yearly, and they are delightful plants, both for the garden in August and September, and for the cool greenhouse in October and November, a few of them flowering late enough to be useful at Christmas. The single varieties are special favourites of mine; great Marguerites in many lovely shades, as they are, they surpass the double varieties in lightness of effect and decorative value, whilst for cutting they are far more useful flowers, especially towards the end of the year.

If you want the very best varieties, you should order rooted cuttings at once of the following

Oxford Dictionary of National Biography

Bean, William Jackson (1863–1947), *arboriculturist and dendrologist*
by Roger T. Stearn
© **Oxford University Press 2004–14** All rights reserved

Bean, William Jackson (1863–1947), arboriculturist and dendrologist, was born at Leavening, near Malton in the North Riding of Yorkshire, on 26 May 1863, the eldest of four sons (there were no daughters) of George Bean (*c*.1833–1869), nurseryman and gardener, following two generations of nurserymen, and his wife, Lydia, *née* Jackson. After her husband's early death Bean's mother worked as a nursery and seed dealer. Bean was educated at Archbishop Holgate's Grammar School, York. Aged sixteen he joined the garden staff at Belvoir Castle, Leicestershire, seat of the duke of Rutland.

In April 1883 Bean started as a student gardener at the Royal Botanic Gardens, Kew, 'the most beautiful garden in the world' (Bean, *Royal Botanic Gardens*, vii). It was 'the world's premier botanical institution' (Drayton, 172), a crucial centre of horticultural training—'Kew "graduates" are everywhere' (*Journal of the Kew Guild*, 1893, 1)—and of imperial botanical research and economic development, and also a popular recreational attraction with millions of visitors.

Bean started work in the melon yard and thereafter, having gained the favour of William Watson (1858–1925), his superior in the garden hierarchy, enjoyed steady promotion: sub-foreman of the orchid and other tropical collections (October 1883), foreman of the temperate house department (1888), foreman of the arboretum (1892), assistant curator (1900), and curator (June 1922). His salary increased accordingly: 16*s*. a week as a gardener, £2 as a foreman, £200 per annum as assistant curator, and £600 as curator in 1929. He helped to implement Sir William Thiselton-Dyer's ambitious improvements, including clearing common trees and thickets, planting systematically grouped trees and large beds of ornamental shrubs, and relocating the bamboos. He was at the arboretum when plant-hunters were introducing exotic trees and shrubs from China, the Himalayas, and Burma, and he accumulated an exceptional knowledge of trees and shrubs. In 1893 he was a founder of the Kew Guild, the organization of Kew gardeners, the 'Kewites'. He was treasurer from 1893 to 1908, edited its journal, and captained its cricket club. He was sent abroad on arboricultural missions and visited Germany and Austria (1908), the USA (1910), and Italy and Dalmatia (1912). In 1914, shortly after the war began, he was seconded to the Ministry of Agriculture and Fisheries but was 'like a fish out of water' (Dallimore, 658) and soon returned to Kew. For some years Sir Arthur Hill (director, 1922–41) depended on his advice. He chose the location and advised on the new pinetum at Bedgebury Park, Kent (jointly with the Forestry Commission). In 1924 he was appointed to the Imperial Service Order (a civil-service long-service award). He retired in May 1929 and was presented with an armchair by the Kew staff.

William Dallimore remembered Bean as, in 1891, 'a tall, well built, quiet young man ... a mighty hitter at cricket, a good disciplinarian [who] did not tolerate shirkers' (Dallimore, 314, 277). A hard-working autodidact, Bean was described as much respected, stalwart, thorough, quiet, modest, dour-mannered, publicity-avoiding,

with ‘sound business ability and administrative capacity’ (*Kew Bulletin*, 1929, 139), and helpful with advice. On 14 August 1901 he married at Plumstead, Kent, Ada Frances Ewart (*b*. 1875), daughter of Charles Ewart, engineer. They lived at Kew and had one son and one daughter. His wife long predeceased him.

Before and after retirement Bean published articles and books. He contributed to the *Botanical Magazine*, *The Garden*, and the *Gardeners' Chronicle*, and in 1908 published *The Royal Botanic Gardens Kew: Historical and Descriptive*. He had long studied woody plants in cultivation and he became the leading expert. Since J. C. Loudon's great *Arboretum et fruticetum Britannicum* (1838) no comprehensive work on trees and shrubs hardy and cultivated in Britain had been published, and many exotic plants, from China and elsewhere, had been introduced by plant collectors. For years Bean, after working during the day in the gardens, in the evening wrote his labour of love and major work, *Trees and Shrubs Hardy in the British Isles*, completed in 1913 and published in two volumes in the autumn of 1914. Based largely on the resources of Kew Gardens, it included brief descriptions of the species and more important varieties of woody plants in cultivation, with notes on their distinctive characters, garden value, and culture. It was intended for amateurs, landowners, country gentlemen, nurserymen, park superintendents, and professional gardeners. Much praised, and recognized as the standard work, ‘Bean’ sold well. A third volume was published in 1933, and five further editions were published in Bean's lifetime. ‘Bean’ had an important influence on twentieth-century arboricultural practice. Bean also published *Shrubs for Amateurs* (1924), *Ornamental Trees for Amateurs* (1925), and *Wall Shrubs and Hardy Climbers* (1939).

Bean was for over forty years involved with the Royal Horticultural Society. He was a member of its floral committee and judged at its flower shows. It awarded him the Victoria medal of honour (1917) and the Veitch memorial medal (1922) and ‘gratefully dedicated’ to him a volume of *Curtis's Botanical Magazine* (1938). An acknowledged expert, he was variously consulted. Between the wars he advised Lionel de Rothschild on his garden at Exbury, Hampshire. Following retirement he lived near the gardens, at 2 Mortlake Road, Kew, prepared the seventh edition of ‘Bean’ (published in 1950), and played golf. He worked with the Roads Beautifying Association and advised the Ministry of Transport on roadside tree planting. He was a member of the committee advising on trees in Windsor Great Park, for which he was appointed CVO (1936).

After prolonged illness, Bean died on 19 April 1947 at Amblecote Nursing Home, 22 Cardigan Road, Richmond, Surrey, survived by his children, and his funeral was at Mortlake crematorium on 22 April. Further editions of ‘Bean’ were published and it is still used.

Oxford Dictionary of National Biography

Beaton, Donald (1802–1863), *gardener*
by Janet Waymark
© **Oxford University Press 2004–14** All rights reserved

Beaton, Donald (1802–1863), gardener, was born on 8 March 1802, 'about sixteen miles from the then parish church of Urray, in Strathconon, Rosshire' (Beaton, 'Autobiography'), the son of Donald Beaton. While Beaton was small his father moved the family to Inverness, where he was acting manager for a cattle dealer, grazing animals on lands rented from Lord Lovat around Beaufort Castle. In the summer months the family migrated up to summer pastures at Corycharbie, where highland sports like deer stalking, grouse shooting, and fly fishing took place.

Beaton, an intelligent boy who spoke Gaelic and learned Latin before he could speak English, was often too far from schools to benefit from regular education in summertime, instead learning how to tan leather and make fishing lines, to dye yarns with lichens, and to clean rifles and shoot deer. He acted as a young gamekeeper for Lord Lovat. An interest in the history of the highlands encouraged him to want to become a cavalry officer, but his mother wanted him to enter the church. She died when Beaton was seven, and his father employed a tutor for the five children; Beaton was determined to join 'the kirk or the camp' and to become a gentleman. A series of hard winters and harvests bankrupted many of the cattle dealers, and, as his father was now short of money, for a brief period Beaton acted as a tutor to the children of Lord Lovat's manager at Beaufort Castle. He attended Inverness Academy for two sessions, intending to try for a bursary to King's College, Aberdeen. Though clever, he was still not a fluent English speaker and, owing to the curious manner in which the top of the class was selected, he was unable to gain a bursary.

Beaton was set to work in the gardens of Beaufort Castle until 'something cast up', and he was allowed to work with the gamekeepers from 12 August every summer (Beaton, 'Autobiography'). Abandoning his dream of becoming a gentleman, he decided to embrace the career of horticulture. The castle gardeners resented his fast track to the brotherhood of gardeners, since they had had to be apprenticed. But he learned about vine growing from Niven of Bothwell Castle, and the Linnean system; he joined the staff of Sir William Cumming Gordon of Altyre, near Forres, where within a year he had gained sufficient knowledge of the plants to be put in charge of them. Probably under the influence of Lady Cumming Gordon, he began one of his two main interests in gardening—that of crossing (interbreeding) bedding plants and bulbs. The other interest lay in colour.

Beaton then went to Perth, 'the best neighbourhood in Scotland for good gardening', where he joined the staff of the nursery of Dickson and Turnbull for two years, and then to the gardens of the Caledonian Horticultural Society in Edinburgh. Deciding to go south, he set off by boat, but was disappointed by the sight of London, where he worked for six weeks at Clapton nursery, before moving west to Haffield, near Ledbury in Herefordshire, where his employer encouraged both his interest in botany and his absence to see as many gardens as he could. Young gentlemen of the time ventured on the grand tour of Europe; Beaton, unable

to become a gentleman, visited gardens instead. In 1832 he ‘travelled 3,000 miles in England alone’ and saw:

> all the Crinums at Wentworth House, the number of pot plants at Chatsworth … the best Orangery in England, near Prescot; the first Petunia that flowered in England, at Lower Boughton, near Manchester; the celebrated rock garden of Lady Boughton, near Chester; the first of the Calceolarias in the Epsom Nursery; the Geranium houses of Sir Richard Hoar, near Bath … a wagon load of dried bulbs, and the Pinetum, at Dropmore. (Beaton, ‘Autobiography’)

After that he made his way round Scotland. At the same time he managed to continue his work crossing ‘all sorts of plants’, and cultivated forty-six sorts of grapes.

After the death of Gordon, his employer at Haffield, Beaton was taken on in the early 1830s as head gardener of Shrubland Park in Suffolk by Sir W. F. F. Middleton, baronet, whom he thanked for encouraging his flower gardening; Beaton later wrote articles in *The Gardeners' Chronicle* (1856) and *The Cottage Gardener* (1850, 1853, and 1855) describing his work there. He married at Eastnor, Herefordshire, on 8 November 1837 Lydia, *née* Penn (*d*. 1850). Following her death he married, as his second wife, on 1 February 1851, Jane (*d*. 1861), daughter of Thomas Parfett, horse dealer. There were no children.

Shrubland Park was Beaton's last position as a head gardener; he retired in 1852, aged fifty, and moved to Surbiton in Surrey, where a well-wisher gave him a garden. He continued to write a weekly column in the *Cottage Gardener* (which became the *Journal of Horticulture*, and in 1861 *Cottage Gardener and Country Gentleman*), and contributed to the *Gardeners' Magazine* until his death, becoming ‘the main publicist of the bedding system’ of planting (Elliott, *Victorian Gardens*, 89). Beaton's comments on the flowers he noticed in his tour of gardens—geraniums (pelargoniums), petunias, calceolarias—suggest his interest in colour. In the 1850s he contributed to the debate about bedding plants and colour; he suggested that it was wise to look at different colours in different lights to see which arrangements worked best, and that there should be a neutral colour in the centre of a group. When Michel-Eugène Chevreul produced his theory of complementary colours in 1839 and 1849 for the Gobelin tapestries (*De la loi du contraste simultané des couleurs*) John Lindley picked up the theme to relate it to the garden and the massing of plants of different colours next to each other. Beaton, however, argued that green would cancel out the so-called effect of complementary colours, and after much debate in the journals this was accepted.

Beaton had successfully hybridized scarlet pelargoniums, among others. However his writing on the cross-breeding of plants, and especially his criticism of the hybridization experiments of the German botanist Karl von Gärtner, ‘evidently knowing nothing of his work’, led Charles Darwin to describe Beaton as ‘a clever, but d-d cocksure man’ whose own experimental results were unlikely to be reliable (Darwin to Hooker, 14 May 1861, *The Correspondence of Charles Darwin*, ed. F. Burkhardt and S. Smith, 16 vols., 1985–, 9.127). Beaton's apology to Darwin for inadvertently upsetting him was published posthumously in the *Journal of Horticulture* (3 Nov 1863). Beaton died at his home in Victoria Road, Surbiton, Surrey, on 31 October 1863, following a stroke.

BEATON Donald.
Effects under £1,000.

21 November. The Will of Donald Beaton late of Victoria-road Surbiton in the Parish of Kingston-upon-Thames in the County of **Surrey** deceased who died 31 October 1863 at Victoria-road aforesaid was proved at the **Principal Registry** by the oath of Robert Hogg of 99 St. George's-road Pimlico in the County of Middlesex Gentleman LL.D. one of the Executors.

BEATON Rebecca.
Effects under £5,000.

11 November. The Will with a Codicil of Rebecca Beaton late of Burngate Farm in the Parish of West Lulworth in the County of **Dorset** Spinster deceased who died 18 July 1863 at Burngate Farm aforesaid was proved at the **Principal Registry** by the oaths of James Panton of Wareham in the said County Brewer and John Broome Mead of the Monastery Farm East Lulworth in the said County Yeoman the Executors.

BEATSON Thomas.
Effects under £600.

5 March. The Will of Thomas Beatson late of Briestfield in the Township of Whitley Lower in the Parish of Thornhill in the County of **York** Farmer and Shopkeeper deceased who died 2 October 1862 at Briestfield aforesaid was proved at **Wakefield** by the oaths of John Beatson of Briestfield aforesaid Farmer the Nephew and Robert Sykes of Lepton in the said County Farmer and Maltster the Executors.

BEATTIE Henry.
Effects under £9,000.

29 September. The Will with a Codicil of Henry Beattie late of the City of **York** Gentleman deceased who died 6 September 1863 at the said City was proved at **York** by the oaths of Thomas Marsh of the said City Bookseller and William Cooper of Briar Cottage Fulford in the County of York Spirit Merchant the Executors.

BEATTIE Hugh.
Effects under £800.

24 June. Letters of Administration (with the Will annexed) of the Personal estate and effects of Hugh Beattie late of Christon Bank in the Parish of Embleton in the County of **Northumberland** Gatekeeper on the North Eastern Railway at Christon Bank

The figures in this work combine botanical accuracy with pictorial beauty in an extraordinary degree, while at the same time there is no uncalled for attempt at striking effect. C. japónica variegàta, the Waratáh, and the apple-flowered, are exquisitely beautiful specimens. It is highly creditable to the gardening profession that there should be found two young men, the one an assistant in his father's nursery, and the other with no pretensions beyond those of a good gardener, and who, we understand, has actually accepted the situation of head-gardener to a gentleman, capable of producing such a work. It is true that the one, from having been born in a nursery famous for its camellias, and the other, from having had an excellent school education in Scotland, having been bred up under one of the best kitchen-gardeners in that country, Mr. Beattie of Scone, and having been long first gardener and afterwards clerk in the Horticultural Society's garden, have had extraordinary advantages; but how frequently are such advantages comparatively neglected! We are proud to see such young men growing up to succeed us in the world, and think we feel almost as much interest in them as if they were our own sons. To all who can afford to purchase such a work we most heartily recommend it. It is sold at much too low a price to afford the authors any profit, but we hope they will meet with sufficient encouragement to save them from pecuniary loss.

LGM, 1830

LGM, 1841

to, p. 45., the first was usually started about the first of January, and the next in April.—*Robert Wilson, gardener to W. Grey, Esq. Norton, March* 6. 1841.

Transmission of Cuttings by Post.—In p. 88. I observe a note respecting the transmission of cuttings by post, wherein it is recommended to wrap them in tin-foil. I consider the employment of this substance quite unnecessary; for the only danger is that of the cuttings being broken, should the letter be crushed or doubled across its length, and against a force that would effect this, the tin-foil would afford but little if any resistance.—*D. Saul, Lancaster, Feb.* 1841.

Art. IV. *Queries and Answers.*

Preventing Hares and Rabbits from injuring the Bark of Trees.—A correspondent in p. 96. enquires whether there is any preparation which will prevent hares and rabbits injuring young trees. I have used very extensively a mixture of soot and milk, and found it very successful. The soot and milk should be well mixed together till they are of the consistency of paint, and applied with a brush to the stems of the trees when the weather is dry. I have used it for some years in the plantations here, where previously the ash trees, even of considerable size, were much gnawed by the hares and rabbits. The black colour which remains upon the trees for two or three years is of no consequence in a plantation, though it might be objectionable in a pleasure-ground or shrubbery.—*W. Leveson Gower, jun. Titsey Place, Godstone.*

To prevent the Ravages of Hares and Rabbits on Forest Trees. (p. 96.)—To one gallon of coal tar add 3 lb. of hog's lard, increasing it to any extent, applying it with the hand or a painter's brush (the former I consider best) to the height of 4 or 5 feet. This will prove an effectual remedy, such being their aversion from tar, that, were a circle drawn round a tree at a small distance from it, they will rarely or never enter it. I need not add, this will not in the least injure the trees.—*John Fish. Colney House, Hertfordshire, Feb.* 12. 1841.

Felling resinous Trees.—What season do you consider the best for cutting down the timber of the spruce fir, Scotch pine, and other resinous trees?—*W. L. Gower, jun.*

We should say any time in the course of the winter months, the sap being then in a comparatively dormant state. In Sweden, and in the Alps and Pyrenees, resinous trees are felled during summer as well as winter, not because it is the best season, but because it is the most convenient one. See *Arb. Brit.*, vol. viii. p. 2135. We shall be glad to hear the opinions and practices of practical men in Britain on this subject.—*Cond.*

Painting Vines with Clay. (p. 96.)—Allow me to ask Mr. Fish whether painting vines with clay, soft soap, and sulphur, is a cure for the curl, as well as a preventive of the hatching of the eggs of insects?—*W. Wilson. Bragden Gardens, Northumberland, Feb.* 15. 1841.

Art. V. *Biography of the late Mr. William Beattie, F.H.S.*

From the commencement of the *Gardener's Magazine* it has been usual to notice individuals who have distinguished themselves in the profession, and to offer some tribute of respect to their memory when they have been removed by death from the sphere of their usefulness, to the regret of their friends and of those who have either benefited from their advice, or profited by their instruction; to few could such a mark of respect be offered with more propriety than to the late *William Beattie*, F.H.S., who, for a long series of years conducted the gardening and foresting departments, as well as the improvements generally, on the extensive estates of the Right Honourable the Earl of Mansfield, at Scone, near Perth. I have long expected that some of his pupils more competent than myself would have performed the task which I have

undertaken; but, as no one has felt it to be his duty to do so, I beg to supply the omission by the accompanying memoir, for the particulars of which I am partly indebted to his nephew, my friend and fellow-pupil at Scone, Mr. Booth, now the gardener and general superintendant at Carclew, Cornwall.

The subject of this brief notice was born at Wasthill in the parish of Old Rain, Aberdeenshire, in 1758, and from being an only son was originally intended for the church; with this view his early years were passed at the parish school, where he obtained a far more liberal education than usually falls to the lot of those who even at the present day adopt the profession of a gardener; and to this very circumstance did he often look back with great satisfaction, and ascribe much of the success and happiness that attended him through life. Just as his friends had made arrangements for sending him to college he had the misfortune to meet with a serious accident which confined him for a long time, and ultimately had the effect of completely altering his future plans and prospects; the delicate state of his health rendering a change advisable, he removed to the neighbouring parish of Moneymusk where some of his friends resided, and there he formed the resolution of becoming a gardener. Sir Archibald Grant, justly celebrated as one of the greatest planters of his time, and of whom Scotland has reason to be proud, was then carrying on extensive alterations at his seat; and, considering this would be a good school, he made application, and was successful in gaining admission to the gardens of Moneymusk, where he served his apprenticeship; on its expiration he went to Edinburgh, and was employed at Arniston, the seat of the then Lord President Dundas, at that time a noted place for young gardeners. From thence he went to London, with letters of introduction to his countrymen, Mr. Malcolm, the eminent nurseryman at Stockwell, and Mr. Forsyth of the Apothecaries' Garden at Chelsea; and, by means of their recommendation, he soon succeeded in obtaining the situation of gardener to the Marquess of Bute, at his seat in Hampshire: but the greater part of the time (nearly twenty years) which he resided in England, he acted as land-steward and gardener at Losset Hall in Yorkshire, and to the Duke of Dorset, at Knowle in Kent. His intimacy with Mr. Forsyth continued until the death of the latter, in 1804; it was entirely through that gentleman he was introduced to the late Earl of Mansfield, and received his appointment to Scone, where he lived for nearly thirty-four years. The formation of the gardens, and conducting of the very extensive alterations and improvements during this long period, at that princely place, will remain for many years as a proof of his talent and ability. He was kind and considerate to those employed under him; and I believe nothing gave him more real pleasure than to see his young assistants endeavouring to improve themselves in matters regarding their profession, or to hear of their good success in life after they had left Scone. On his retiring from the arduous duties of his situation in 1837, the late Lord Mansfield not only allowed him to retain his salary, but presented him with several articles of value. Amongst the latter, an elegant silver box, engraven with an inscription expressive of his esteem and regard. Indeed all the members of that noble family were unremitting in their attention to him during the remainder of his life.

He was a corresponding member of the Caledonian Horticultural Society, and a fellow of the Horticultural Society of London, to both of which he contributed one or two papers, which are published in their *Transactions*. He was married, but had no family, and died on the 2d of April, 1839. His remains were interred in the churchyard at New Scone, (as well as those of Mrs. Beattie who survived him only twelve months,) near to the monument now erecting by public subscription to commemorate the unfortunate Douglas, who was also at one time his pupil and assistant. — *James Duncan. Basing Park, Alton, Hants, March* 3. 1841.

Date of Death: 1727

Gender: male

Nationality: French

Occupation: Gardener

Narrative:

Guillaume Beaumont was a French gardener, active in England from the 1680s to 1727. He may have worked under Le Notre in France. In England, he was employed by Colonel Graham, first as a nurseryman at Bagshot, during the reign of James II, and later, after 1688, as head gardener at Levens Hall in Cumberland, where he laid out a fine topiary garden and series of avenues.

FAMOUS GARDENERS AT HOME.

No. 20.—Mr. E. Beckett, F.R.H.S., at the Gardens, Aldenham House, Elstree.

The charge of such gardens as those of Aldenham House must afford pleasure, not only because of their beauty, variety and extent, but also because Lord Aldenham and

Mr. E. Beckett.

the members of his family personally interest themselves in the operations of their custodian. The owner of one of the finest estates in Hertfordshire was, as Mr. H. H. Gibbs, extremely popular as a member for the City of London, but it is among his own people that Lord Aldenham shines most of all. In the village of Aldenham, whose church he has made a joy to the parishioners, there is not a resident who does not highly esteem him, and the feeling towards him among the large number of persons he employs is respect, tempered with affection. Wealthy as he is, and generously as he gives to every good cause—more generously than the outside world knows—the tastes of the octogenarian peer, who is still hale and active, are simple, and perhaps he is never happier than when he is walking in his pleasure gardens and grounds, some 200 acres in extent, in which he takes a justifiable pride. Lord Aldenham's love of horticulture is particularly shared by his son, the Hon. Vicary Gibbs, who represents the St. Albans' division in Parliament. In fact, when, having seen a portion of the gardens, and glanced at some of the treasures of the houses, I began to ask questions about the great work which has been done at Aldenham in recent years, Mr. Beckett, at the outset, told me that he owed much to the assistance of Mr. Vicary Gibbs, who is not only fond of the gardens, and spends most of his time in them, but has a remarkable practical knowledge. Mr. Gibbs, he said, is as popular with the workpeople on the estate as he is among his constituents.

"As to the work itself," continued Mr. Beckett, "we commenced entirely remodelling the gardens soon after I took charge of them, nearly eighteen years ago. The most extensive alterations were the extensions made in 1891-1892, when the high road was diverted to the extent of a mile and three-quarters. That meant treating the land inside, the greater portion of which has been thrown into ornamental grounds."

"Had you any natural advantages to assist you?"

"None whatever, except timber trees. As there was no water, we had to provide it, and as all the land taken in was absolutely flat, we used the excavated ground for making undulations."

"Now, about the details. Who designed the rock and water garden?"

"The rockeries were done by Messrs. Pulham and Son, of Broxbourne, but the landscape was designed by myself and Mr. Vicary Gibbs, who took the utmost interest in the work throughout. One very important feature was the opening up of the moats belonging to the original house, which is supposed to have been taken down in the time of Henry VIII. There were trees fifty feet high growing in the moats, which eventually we converted into the bog and water garden you have just seen. The old fish-store was transformed into the present bathing pond. The water garden, in which you noticed two stone bridges, one rustic wooden bridge, and several waterfalls, involved a great deal of thought and labour."

"It contains a fine collection of flowering trees and shrubs?"

"I believe the collection is one of the most complete in the country. We get trees and shrubs from nearly all quarters of the globe, including Japan, as well as from all parts of England. We have just received a Japanese consignment."

"One of your difficulties must have been the easy natural formation of the ground work, and the nice paths to correspond?"

"Yes, that was so. Another new feature is the St. Albans' drive, about three-quarters of a mile long, over one of the bridges. It is a continuation of the old drive from the lodge gate, which is also a mile long."

"And the delightful wilderness?"

"That is also in its present state a part of the work. New paths were made, with gravel underneath and grass on the top, with the result that they are dry in all kinds of weather. The wilderness which, with the woods in connection, comprises about forty acres, has an immense variety of flowering trees and shrubs planted for effect at all seasons of the year. They are now yellow, and red, and brown woods, which are very effective at this season."

"When did you form the lake?"

"We began it about four years ago, and it took nearly two to finish. It was previously an ordinary formal piece of water. The ground was all broken up and undulated, as it is in the water garden. A new bridge was built of the same material as the house, and a rock boat-cave was constructed. The lake is seven acres in extent, and there is plenty of good fishing. There are two islands in it, and two large waterfalls. The sides are walled round in order to keep the rats out and the banks from being washed away."

"Does the lake exhaust the additions?"

"By no means. We have also made new tennis and croquet lawns, a new flower garden, new sub-tropical gardens, new kitchen gardens, and new orchards and terraces. Indeed, the place has been renovated from end to end. There is not a corner that has not been done."

"Have you exhibited much?"

"I used to exhibit very largely, especially Chrysanthemums. I showed fifty-two twenty-fives in various parts of the country, and was only beaten twice."

"That must have been a record?"

"It was, I believe. In 1900 we took the first prize for forty-eight varieties of Sweet Peas at the Bicentenary, and in addition the fifteen-guinea cup for the best exhibit in the show at the Crystal Palace."

"Speaking of Chrysanthemums, when did you invent the Beckett Cup and Tube?"

"About ten years ago. I have sold as many as six thousand in a year, which, considering that these can only be used for about two months out of twelve, is rather remarkable."

"Does the popularity of the invention continue?"

"Nearly two thousand were sold last year."

"You have also published a book, Mr. Beckett?"

"Yes, two years ago Messrs. Simpkin, Marshall and Company brought out a small work of mine on "Vegetable Culture."

"Have you shown many vegetables?"

"A good many, and I have been first at nearly every show at which I have competed. The prizes include five gold medals, won at the meetings of the Royal Horticultural Society, one of which was at the Temple last year."

Lawns and Rose Garden at Aldenham House.

VOL. LI.—No. 2,842. SATURDAY, APRIL 18, 1908.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

National Rose Society.

The receipt of a parcel of literature from the National Rose Society is of much interest as evidence of the committee fully appreciating the fact that a society which is national in name, and in its aims, should do something more than hold one or more exhibitions annually, and that they have given practical expression to their appreciation by the provision for the members of additional books relating to the rose. We are especially gratified by this evidence because of the proof it gives of a continuance of the wise policy which was initiated a few years since, and has contributed in no small degree to the almost phenomenal extension of membership and to the increase in the influence and usefulness of the society, which now occupies a commanding position among the organisations that are devoted to special classes of flowers. It would have been well had the committees of two or three other of the special societies adopted a policy akin to that which has been so immensely successful in the case of the National Rose Society. Not only is it probable that they would have now been in a more flourishing condition, but they would have accomplished much more in the extension and improvement of the flowers that justify their existence. In directing attention to the value of supplying the members with literature relating to the respective classes of flowers, we must not be understood as suggesting that competitive gatherings should not occupy the most important position in the year's work. All that we are desirous of doing is to suggest the desirability of societies adopting a policy by which all classes of members will be brought into touch with each other, and that those who do not exhibit or are unable to visit the shows should have a useful souvenir of the year's work. Exhibitions, we need hardly point out, provide a healthy stimulus for cultivators in their endeavour to bring the flowers and other objects in which they are interested to the highest state of development, and give them an apportunity of meeting together in friendly rivalry. Not only do competitive gatherings provide an admirable meeting place for the leading cultivators, but they provide abundant entertainment for those who love and grow the flowers simply for the enjoyment of themselves and their friends, and give them an opportunity of becoming acquainted with the novelties within a short period of their being introduced to cultivation. The publications we have received from the National Rose Society are the "Rose Annual" and "The Enemies of the Rose," two works of much value to those interested in roses, although of unequal merit, that fully justify the congratulations which Mr. E. Mawley, V.M.H., received from Mr. C. E. Shea, who presided at the meeting of the General Committee on Tuesday afternoon. The first of the two publications, although a considerable advance upon last year's "Annual," falls somewhat short of what such work should be. The contents are of great practical value, but just a trifle heavy, and we would suggest that an endeavour be made to make the pages of future issues a trifle brighter. It is, of course, easier to make such suggestions than to give practical effect to them, for there are but few rosarians who can write of their flower in language that so well befits it. The weakest part is the mixing up of the advertisements with the literary matter, and we have a strong objection to having to search among the advertisement pages for the portrait of the president of the society. Of the contents and production of "The Enemies of the Rose" we have nothing but praise, and after a close examination of its pages we have no doubt as to the rather heavy cost being fully justified. It is no ephemeral publication requiring frequent revision, but one that will long remain the text book of the fungoid diseases to which the rose is liable, and of the numerous insect pests that prey upon its various parts. The section of the book devoted to diseases caused by fungi has been written by Mr. George Massee, V.M.H., an authority of the highest eminence; and insect pests have been dealt with by Mr. F. V. Theobald, M.A., who has long been recognised as one of the leading authorities on economic entomology. There are eight coloured plates, in which all the principal insect pests and plant diseases are admirably represented.

MR. EDWIN BECKETT, V.M.H.

Mr. Edwin Beckett, V.M.H., of Aldenham House Gardens, Elstree, Herts, is unquestionably one of the most widely-known gardeners in the United Kingdom. Mr. Beckett was born at Henley-on-Thames, and as his father was a gardener and successful exhibitor, our friend was born into the profession. He was apprenticed under Mr. J. Neville, who is still living at Marsh

Mills, and subsequently he went to the famous Greenlands Gardens, at Henley, Mr. W. H. Good being then head gardener there. Extensive alterations were being carried out at Greenlands, and the gardens had a high reputation for specimen hardwooded plants. As foreman under Mr. G. King, then gardener to the late Robt. Few, Esq., Wolsey Grange, Esher, Mr. Beckett had considerable experience of exhibiting, the garden being specially notable in those days for its specimen pelargoniums and other soft-wooded subjects. After four years at Wolsey Grange Mr. Beckett became head gardener and bailiff to the late J. McConnell, Esq., of Moor Place, a prominent position for so young a man. On the death of his employer Mr. Beckett took up similar duties at Sandown House, Esher, the residence of J. P. Currie, Esq., and from both these gardens he exhibited largely and successfully. It was in 1885 that Mr. Beckett obtained his great chance of success, as he was then appointed head gardener to the late Lord Aldenham, at Elstree, a position he has filled to everyone's satisfaction. Under the generous encouragement given him by the Hon. Vicary Gibbs, and the late Lord Aldenham, Mr. Beckett has made the fine gardens and pleasure grounds that are the pride of Hertfordshire. As a grower of high-class vegetables, and as the most successful exhibitor of them, Mr. Beckett has gained much fame, but it must not be forgotten that he has been eminently successful with chrysanthemums, and with stove and greenhouse plants, and with hardy fruits, while his knowledge of choice trees and shrubs is a very wide one, and his taste and skill as a landscape gardener are of the highest class. Mr. Beckett has also found time to improve some kinds of flowers and vegetables; he has raised numerous beautiful new Michaelmas daisies and pentstemons, and he has produced unusually fine varieties of culinary peas, celery, and beet. A few years ago Mr. Beckett produced "Vegetables for Exhibition and Home Consumption"; the text first passed through our pages, to which Mr. Beckett is a valued contributor. In local politics Mr. Beckett takes his part, and he is very proud of having been chairman of the parish council at Elstree during the past four years, and a member of the body since its institution.

The Nickerson Prizes for Roses.—Last year Mr. W. E. Nickerson, of Cambridge, Massachusetts, U.S.A., presented to the National Rose Society three silver cups, of the value of five guineas each, for the raisers of the best hybrid perpetual, the best hybrid tea, and the best tea for general cultivation sent out in 1900 or subsequently. The cups were awarded by a vote of the committee to the raisers of Frau Karl Druschki, Dean Hole, and Madame Jules Gravereaux respectively. This year Mr. Nickerson offers twelve cups for the same number of roses, four for (A) climbing roses producing their flowers in clusters, four for (B) climbing roses producing their flowers singly, and four for (C) dwarf roses for beds. The relative merits of the varieties were determined by the vote of the committee, and a number of other rosarians, and the result of the ballot was reported at the meeting of the General Committee of the National Rose Society, held on Tuesday. This was as follows: A, Crimson or red. Crimson Rambler, Grus an Teplitz, Hiawatha. Pink shades, Dorothy Perkins, Blush Rambler, Lady Gay. White, Aimée Vibert, Félicité Perpetué, Bennett's Seedling. Yellow shades, Allister Stella Gray, Claire Jacquier, Aglaia. B, Crimson and red, Ards Rover, Reine Olga de Wurtemberg, Longworth Rambler. Pink shades, Climbing Mrs. W. J. Grant, Climbing Caroline Testout. White, Madame A. Carrier, Una, Macrantha. Yellow shades, W. A. Richardson, Gloire de Dijon, and Madame Jules Gravereaux. C, Crimson and red, Hugh Dickson, Ulrich Brunner, Richmond. Pink shades, Caroline Testout, Madame Abel Chatenay, and La France. White, Frau Karl Druschki, White Maman Cochet, and Viscount Folkestone. Yellow shades, Madame Ravary, Marie Van Houtte, and Souv. de Pierre Notting. The first of each triplet is the cup rose, and the names of varieties that were second and third in the ballot were given for the information of the cultivators.

Foreign Fruits were plentiful in British markets during March, and the aggregate value represents a substantial increase upon that of the corresponding month of last year. Apples were imported in much larger quantities, the total having been 357,484 cwt., of the value of £208,401, or an increase in quantity of 79,151 cwt., of the value of £31,828. Apricots and peaches on the other hand show a relatively large decrease, the aggregate imports having been 62 cwts., of the value of £184. Bananas, as in the case of apples, were more plentiful than in the two preceding years, the total having been 530,107 bunches, of the value of £341,984, or an increase in numbers of 140,241 bunches, and in value of £32,612. In the imports of grapes also there was a large increase, the total having been 5,584 cwt. of the value of £24,138, these figures representing an increase in quantity of 3,783 cwt., and in value of £16,952. In the imports of lemons there was an increase, but nuts and oranges were received in considerably reduced quantities. Pear imports show an increase in quantity of 347 cwt., and in value of £410, the total having been 1,834 cwt. of the value of £4,945. Plums, on the other hand, were received in smaller quantities, the total having been 198 cwt., of the value of £429, as compared with 538 cwt. of the value of £2,851 in March, 1907. The value of the strawberry imports is returned at £2, and of unenumerated fruits the imports were 3,828 cwt. of the value of £6,419, these figures representing substantial decreases. The total value of the fruits for March was £866,248, or a gain of £30,287 as compared with the corresponding month of last year.

The Gardeners' Company.—In the year 1605 King James I. granted by Letters Patent to the gardeners carrying on their business in the City, or within six miles of its boundaries, incorporation as a Guild, and the bye-laws and ordinances of the company were confirmed in the following year. Notwithstanding these letters patents the members of the company had a difficulty in selling their products, owing to the opposition of unqualified persons. The Recorder (Sir E. Littleton), who subsequently became Lord Chancellor, issued in 1632 a warrant for the apprehension of persons using the trade of gardening in contempt of the company's charter, and this warrant continued in force until 1645, and is regarded as having contributed materially to the usefulness of the Guild. The Master, Wardens, Assistants, and Commonalty of the Gardeners' Company have sent a memorial to the Lord Mayor asking permission to present to the Lord Mayor annually a basket containing flowers, vegetables, and herbs, in remembrance of the Recorder's warrant. The Lord Mayor has assented to the request, and fixed Wednesday, July 1, for the first presentation.

Commons and Footpaths Preservation Society.—At the monthly meeting of this society, held a few days since, the proposal of the War Office to conduct manœuvres on a large scale in the New Forest during the coming summer was considered, and it was decided to co-operate with the verderers, commoners, and others interested in taking such action as might be necessary to secure that due regard should be had to the protection of public interests under the Military Manœuvres Act. It was also decided to urge the President of the Local Government Board to amend Section 7 of the Housing and Town Planning Bill now before Parliament. As drawn the Bill would give local authorities power to alienate open spaces committed to their care for the purpose of providing sites for dwellings for the working classes, and it was resolved to press that common land, or land dedicated to the recreation of the public, should be exempted from the operation of the clause. It was reported that the Board of Agriculture had now issued draft schemes for the regulation under the Commons Act, of Towyn Trewan Common, Anglesey, 1,300 acres in extent, and Maidenhead Thicket and Cookham Commons. Also that the litigation with regard to a large and valuable driftway crossing Marsden Moor, Yorkshire, had terminated in favour of the public, and that up to the present subscriptions and guarantees amounting to £1,552 had been received towards £1,800 needed to secure the purchase of Ludshott Common and a strip of land adjoining Waggoners Wells, near Haslemere.

New Daffodils.—A few remarkable new daffodils were shown by Mrs. Backhouse, of The Court, Sutton, Hereford, at the recent meeting of the Royal Horticultural Society, but as they came late, and were placed at the end of a trade group, they received little attention from any but a few experts. A huge finely formed trumpet daffodil, named Harvest, a sort of refined Glory of Leiden; a beautiful white trumpet variety that Mr. Engleheart promptly annexed for a pollen parent; and a flower with an enormous trumpet, named Jumbo, were three of the most startling varieties in a small set of very fine seedlings. It was a pity the flowers were brought so late, as this permitted the display in only an unimportant position.

Mr. Joseph Mallender, who for the long period of forty years was head gardener at Hodsock Priory, Notts, the residence of Lieut.-Colonel Mellish, has recently retired from the position he has so worthily occupied. Throughout the period he had charge of the Hodsock Priory gardens he associated himself with all the movements that had for their object the advancement of horticulture in the district, and thereby gained the respect of all classes. On it becoming known that Mr. Mallender was relinquishing his charge, his many friends decided to present him with some memento of their esteem, and a few evenings since a meeting was held at the Blyth schoolroom for the purpose of giving practical effect to this decision. There was a large gathering, in which the principal gardeners in the district were prominent, and Mr. Mallender was presented with a marble clock, bearing a suitable inscription, an armchair, and a purse of gold. Mr. Elliott, who presided, and other speakers referred in appreciative terms to the splendid services Mr. Mallender had rendered to the district, and testified to the respect in which he is held.

on the nature of the ground. If it is soft and mossy the lawn-mower will sink into it, and plough furrows here and pare off patches there; but if it is fairly firm the cutting can be done quite easily. And it will benefit rather than injure the grass. A brown line may show on some of the blades where the cut has been made, but that will be of no consequence. The turf will be all the firmer and closer for being kept short. H. C. DAVIDSON.

People You Hear About.

MR. EDWIN BECKETT, V.M.H.

In the art of growing superb examples of vegetables—an art which at the present time is of great importance to the nation—Mr. Edwin Beckett is a pastmaster. His successes in this branch of horticulture are numerous, and have extended over a long period, for as far back as 1883 he won three first prizes for collections of vegetables at the Royal Horticulturral Society's shows—then held at South Kensington—in very keen competition and against the best growers of the day. But before then Mr. Beckett had won his spurs as an exhibitor, mainly with Japanese Chrysanthemums and trained specimen plants. Since that date his name has been prominently before the public as a leading prize-winner, for he has exhibited in all parts of the United Kingdom, and his list of trophies is a lengthy one. Gold medals alone number between fifty and sixty (including the coveted Hogg memorial medal), and he has been awarded the Grand Prix, with cups and silver-gilt and silver medals innumerable. At the bi-centenary exhibition of the Sweet Pea, held at the Crystal Palace, beside winning several firsts, he was awarded the valuable cup for the best exhibit in the show.

MR. EDWIN BECKETT.

Mr. Beckett commenced his gardening career at a very early age—indeed, he may be said to have been born in it, for his father was gardener at Remenham Lodge, near Henley-on-Thames, where, in 1853, he first saw the light, and where he received his first lessons in the craft. From this place he went to Marsh Mills, under the late Mr. John Neville, a skilful gardener and a remarkably successful exhibitor at local shows. After spending some three years here he migrated to Greenlands, Oxfordshire, then under the charge of Mr. W. H. Good, one of the best-known gardeners of that time, and one to whom Mr. Beckett ascribes much of his after success. While he was here extensive alterations were carried out, the estate being acquired by the late Rt. Hon. W. H. Smith. At Greenlands there was one of the finest collections of hardwooded stove and greenhouse plants, including Azaleas, in the country.

Mr. Beckett was but a youth of seventeen when he went to Woodsey Grange, Esher, to fill the responsible post of foreman under Mr. G. King. The proprietor, Mr. Robert Few, was an enthusiastic horticulturist, and exhibited on a large scale, specimen Pelargoniums of all sorts being especially favoured by him.

Four years later Mr. Beckett was engaged as head gardener and bailiff to Mr. J. McConnell, of Moor Place, Esher, and it was at this time that he began to pile up the wonderful list of successes that stand to his credit. On the death of Mr. McConnell, he was engaged by Mr. J. P. Currie, of Sandown House, Esher, with whom he remained for nearly four years. It was while he was here that he gained the three prizes for vegetables, already mentioned.

Early in 1884 Mr. Beckett was engaged by the late Lord Aldenham, of Aldenham House, Elstree, Herts, and as head gardener he has remained here for close on thirty-three years. When Lord Aldenham died, his son, the Hon. Vicary Gibbs—one of the keenest amateurs of the day—carried out, with Mr. Beckett, very extensive alterations in the planning of the gardens and grounds, and they have formed perhaps the finest collection of trees and shrubs in the world—certainly the best in a private garden. Here are to be seen choice specimens from every clime.

Mr. Beckett has raised many new vegetables and plants. To him we are indebted for those two fine Peas, Quite Content and Edwin Beckett, for Aldenham Pink and Aldenham White Celery, Victory and Ideal Cucumbers, Golden Perfection Tomato, and many others. Of plants, Pentstemons, Polyanthus, Streptocarpus, and Michaelmas Daisies are amongst those he has worked on, and as recently as October 10th he showed seven new varieties of Michaelmas Daisies at the Royal Horticultural Hall, one of them obtaining an Award of Merit.

As a judge at exhibitions, Mr. Beckett's services are in great request. He is a frequent contributor to the gardening Press, and is author of the standard work on vegetable culture, "Vegetables for Home and Exhibition," of which two editions have already been published. Another of his works is "The Book of the Strawberry." His name is also connected with two or three gardening inventions, and of his Chrysanthemum cup and tube many thousands have been sold.

In 1906 he was awarded the Victoria Medal of Honour. He has been a member of the Fruit and Vegetable Committee of the R.H.S. for many years, and in 1912 was one of the directors of the International Horticultural Exhibition, besides being a large and successful exhibitor.

Local affairs are not neglected, for Mr. Beckett has been a member of the Aldenham Parish Council (which includes Radlett and part of Elstree) since its inception, and has held the post of chairman continuously since 1904, together with other offices in the district.

POLLINATION OF APPLES.

Your correspondent, "J. K. (Northumberland)," will find much to interest him on the subject of pollination of Apples, etc., together with a list of fruits supposed to be self-fertile or the reverse, in a paper by C. H. Hooper, published in Vol. 39 of the Journal of the Royal Horticultural Society, p. 238. The subject is not yet fully understood, but so far as my own experience goes, it makes little difference to the fruiting whether an Apple is self-fertile or self-sterile, provided a sufficient number of varieties are grown to give the self-sterile trees a chance. The spring in this district was much the same as that described by your correspondent. I find that of nine trees supposed to be self-fertile, six fruited well and three were failures; and that of fifteen trees supposed to be self-sterile nine fruited well and six were failures. The difference is not important. The failures are in some cases relative only, and they include varieties that fruit well only every other year. Really, the only trees that disappointed me were Lord Suffield, Sandringham, and Warner's King. On the other hand, Wellington and Worcester Pearmain have done better than usual.—H. F. B. (Chester).

[We are much obliged to you for calling our attention to the article on the subject of self-fertile and self-sterile varieties of fruit by Mr. C. H. Hooper. That gentleman has now gone much further into the subject, and other people are also at work; but it will doubtless take some years yet to settle the whole question, because the number of varieties to be dealt with is so very great. "J. K. (Northumberland)" wished for a list or catalogue that would show all the self-fertile and self-sterile varieties, and those that would set the fruits of the latter. That book has yet to be written, when the experiments have gone far enough to warrant correct conclusions about the bulk of the varieties in cultivation. We agree with you that it would not help very much in securing a crop of fruit to plant only self-fertile varieties. The self-sterile varieties usually fruit quite well when a number of them are grown together.—Ed.]

Garden Life "At Home."

SEVERAL correspondents have written to me with respect to my remarks on the less-known vegetables, and they all make the same point—We do not try them because we know nothing about them, and never see them. It is true they do not come to market in large quantities, but now and again they are offered for sale in the shops. But why should we not grow them for ourselves? I am passing on the letters to our Editor, and hope he will see his way to giving us the necessary cultural information in due course.

And now I am giving a recipe for making a hot salad, which should prove very acceptable in cold weather. The ingredients are very few, and its preparation is simple.

HOT SAVOY SALAD.

Take the heart of a Savoy, wash carefully, and slice it up very finely; then place it in a covered pan with a little butter or good margarine, and a little chili vinegar. Toss this carefully until it is well heated through, but not enough to blunt its crispness. Then place it in a bowl, pour the liquid over it, and add a dressing of sugar, grated lemon peel, and vinegar.

BROCCOLI AS AN ENTREE.

A large white head of Broccoli (or Cauliflower when it is obtainable) may be made into an excellent entree. Trim off the green leaves, and cut the stalk flat at the bottom, wash it well, and then boil whole. When done, lift it carefully from the saucepan, drain it, and place it upright in an entree dish or round vegetable dish, using great care that it does not break. Have ready about three-quarters of a pint of melted butter, and into this grate a piece of cheese—size according to taste; let this boil, then pour it over the Broccoli, and serve it hot. If cheese is not liked, half a pint of skinned shrimps might be used instead.

A TABLE DECORATION.

For a handsome table centre, golden and bronze Chrysanthemums are very effective when set in a large gilded or silver basket, and if the blossoms are really fine, and there is plenty of graceful foliage with them, this centre could very well be the only ornament on the table, all that is then necessary being to arrange on the cloth some sprays of small flowers, with Smilax and Ferns.

If the basket has a handle, wreathe this with Smilax. The basket should be lined with zinc; if it is not, stand in it a bowl or jar filled with damp sand and moss, into which the flower stalks can be firmly inserted. In the Decorative varieties, December Gold and Nagoya are excellent yellows; Freda Bedford is bronzy orange; Niveus is white; A. J. Balfour is pink; and N. C. S. Jubilee deep mauve. These are all December-flowering sorts. Add tall sprays of Asparagus Sprengeri, and some brightly coloured leaves of a foliage plant, if these can be got. Around the edge of the basket set small clusters of Violets, mixing deep purple with paler colours. If it is decided to carry the decoration to the corners and sides of the table, then have long trails of Smilax leading from the centre, arranging among them, at intervals, loose sprays of Violets, with their own foliage.

LADYBIRD.

FAMOUS GARDENS :: IN WAR TIME. ::

HOW THEY ARE BEING MAINTAINED WITH REDUCED STAFFS.

I.—Interview with Mr. Edwin Beckett, V.M.H., of Aldenham House Gardens, Elstree.

THE gardens of Aldenham House, Elstree, Herts, are among the most famous in England. The late Lord Aldenham took a keen interest in horticulture, and gave every support to his able head gardener, Mr. Edwin Beckett, V.M.H., under whose care the grounds have been for the past thirty-three years, and to whom was entrusted the task of designing and laying them out, with the co-operation of the Hon. Vicary Gibbs. When, on the death of the late Lord Aldenham, the house and grounds were taken over by his second son, the Hon. Vicary Gibbs, Mr. Beckett was fortunate in finding in his new employer an even more enthusiastic horticulturist, whose main delight it is to add to and improve the beauties of the place.

Extending to over two hundred acres, these gardens embrace every attraction that can be named, and, did space permit, one could descant at considerable length on their charms. Woodland and park, water garden and lake, rolling lawn and trim parterre, rockeries and bog garden, herbaceous borders and flower beds, orchard and kitchen garden—of each much might be written. But perhaps the most noteworthy feature is the wonderful collection of trees and shrubs. Here are gathered specimens of the choicest and rarest from all quarters of the globe, and in no other private garden in England—perhaps not in the world—is it possible to find so large and varied an assortment.

To maintain these gardens at their high level of excellence demands the services of a large and skilled staff in peace times; and to see how they fared under present conditions I made a visit on the last day of May.

FOOD PRODUCTION BEFORE EVERYTHING.

"Food production is our chief aim now," Mr. Beckett explained, as we drove from the station; "and everything else is subservient to it. Both the Hon. Vicary Gibbs and his brother, Lord Aldenham, are insistent upon that, and are doing all they can to promote it. This winter we have ploughed up a large area of park land—about thirty acres—which has been put down to Potatoes. We finished planting this only a fortnight ago, and in addition, as you will see, we are growing vegetables in spaces which formerly we used for more ornamental subjects."

"The Potatoes are, of course, grown for market?" I suggested.

"Certainly," was the reply; "we are trying to do what we can to help to increase the food stock of the country."

"And how do you stand for labour?"

"The lack of skilled labour is a serious drawback here. We have lost fifty of our best hands, and cannot replace them under existing conditions. Our present staff consists almost entirely of men and boys under and over military age or medically unfit, with the exception of only one man exempted."

"Do you employ any women gardeners?"

"We have about a dozen ladies, but their previous gardening experience is practically nil. They are, however, very useful among the fruit and vegetables."

"That means that much of the work will be left undone?"

"All we can hope to do is to keep the most important things going, and the rest must be left more or less to take their chance. At present, as I have said, all our efforts are concentrated on vegetables and fruit. But here we are at the gardens, and you can see for yourself something of what we are doing."

UTILITY FIRST.

Mr. Beckett then conducted me along some of the famous walks, where, in former years, large quantities of flowers of all sorts were grown. But now their places are taken by vegetables, such as Potatoes, Cauliflowers, and other members of the Cabbage tribe, Beet, etc. So, too, with the fruit borders: sites previously a mass of bloom from now on are occupied with the less ornamental but more useful vegetable and salad plants.

Before proceeding to the vegetable quarters proper, we went through some of the houses, many of which are already cleared, and given over to Tomatoes, Melons, Cucumbers, Marrows, French Beans, etc. Asking Mr. Beckett about the celebrated collection of scented-leaved Geraniums, he replied:

"We are trying to keep them, because they are unique. The Streptocarpus in the next house is another thing we are anxious not to lose, for the strain is one of my own raising, and cannot be surpassed by any other in the country."

"You have a promising lot of Tomatoes here," I remarked as we entered another house.

"They are Golden Perfection, a variety of my own raising," was the reply. "When they are over we shall follow them with another crop, and clear these off in time for another lot of Tomatoes for winter."

Every house we visited bore similar evidence of the intention to subordinate beauty to utility, and the same thing was even observable when we came to the lawns surrounding the house.

"I do not think it is worth while to fill the beds in front of the house with vegetables, as we have so much good space elsewhere, so I am going to plant a number of Fuchsias, Pentstemons, and Plumbagoes, as we have plenty of them; but except for the bit of grass under the windows, there will be no mowing done this season," said Mr. Beckett.

HAY FROM THE LAWNS.

"How many acres do you usually mow?" I asked.

"From forty to fifty," was the answer. "This is the first time in my thirty-three years' experience of the place that the grass has been as high as it is now, but we should secure a large quantity of hay, which will undoubtedly be required. By letting mowing go we shall save considerable labour and machinery."

"And what will be the ultimate effect on the grass itself?" I asked.

"It should do it good," said Mr. Beckett. "After the hay has been cut we shall mow and roll the lawns in autumn, and they will then suffer no harm."

"Will you do anything in the way of spring bedding for next year?"

"It will take up too much time preparing for it. We should, of course, be starting now; but we cannot spare the labour, so we shall be without spring bedding."

THE GARDEN STAFF AT ALDENHAM HOUSE.

Entering the old kitchen garden, Mr. Beckett pointed to a number of rows of Peas, which were carrying many pods, well-filled, and remarked:

"There is a good hint that every amateur could easily adopt. You see that these Peas are sown in boxes, and are not turned out, but the boxes are sunk bodily into the ground. They were sown last November, and will be ready to pick by the first week in June. The boxes can be stood in a frame or a greenhouse, or even in a spare room."

"But how do they attain such dimensions, with clean and splendid haulm, in boxes?" I inquired.

"The boxes have large holes in the bottom, and the roots find their way through them into the soil."

"What varieties are they?"

"There are three, and, as you will observe, they are all marrowfats. They are Edwin Beckett, Duke of Albany, and Quite Content, and they come into bearing in the order in which I have given them to you."

"Do you find Quite Content a satisfactory Pea?"

"It was, as you are probably aware, raised

Digitized by Google Original from CORNELL UNIVERSITY

in these gardens, and you can see for yourself what it is like. It requires to be well grown, and then is a most productive Pea and a continuous cropper. You will notice that the pods are in pairs, and each carries from ten to twelve good Peas."

"Are these three varieties the only ones you grow?" I next inquired.

"We grow also Autocrat for late crops, and one or two others in smaller quantities," was the answer.

GOOD POTATOES.

A good breadth of early Potatoes was next visited, and I asked Mr. Beckett what he considered the best varieties.

"May Queen and Midlothian Early are the two we find do best," he answered.

"And what do you recommend for maincrops?"

"We are growing Great Scot, King Edward, The Factor, and Iron Duke," was the reply. "Iron Duke is a new variety, which promises well. It appears to be an excellent doer, and is a strong grower. We are also growing these varieties for market, on the park land I pointed out to you."

"Did you sprout them?" I asked.

"Some were sprouted," was the answer, "but we could not get them all done. It is without doubt the best system."

"Do you limit the number of sprouts when planting?"

"We allow two sprouts to each, as far as possible. The maincrops are planted fifteen to eighteen inches apart, and nearly three feet between the rows. This distance permits air to play round the plants, and helps to prevent disease. We constantly stir and loosen the soil."

A GREAT HOTBED OF LEAVES.

Turning a corner, we next came to a huge hotbed, some fifty yards wide and long, on which were a number of frames, filled with crops in various stages of development.

"This hotbed," said Mr. Beckett, "is made up of leaves, with just a covering of straw to protect it. Only half is renewed each year, the leaf-mould taken away being used in different parts of the garden, as wanted. The leaves give sufficient warmth to enable us to raise early crops, such as Marrows, Beet, Cabbages, Cauliflowers, Celery, Turnips, Carrots, and Asparagus. Some things we are able to force, others we bring on early, and plant out when the weather is favourable, following them with other crops. The bed retains its heat for about three-quarters of the year. Any amateur can forward his crops in a similar manner—of of course, on a scale suitable to the means at his disposal. Here we waste nothing, and as the soil is a heavy clay, we use the spent leaves for top-dressing and improving it."

Close to this great hotbed is a long row of frames, also built up on leaves, with a few inches of old potting soil on top. In one I noticed a fine crop of Carrot Champion Horn, ready for pulling. This, I was informed, was sown on January 4th. Other frames were full of vegetables of different kinds, ready to go out.

HOW LEEKS ARE GROWN.

Further on we came to the old kitchen garden, where—as becomes a past-master in the art of vegetable-growing, as Mr. Beckett admittedly is—everything was in perfect condition. I noticed several rows of Leeks, planted on the level, with strawboard cylinders round them.

"This is how we grow our best Leeks," remarked Mr. Beckett; "or if we do not use the cylinders we tie brown paper round them. The soil is then kept out of them when we earth them up, and as the necks lengthen we raise the collars. Between every two rows of Leeks we have a row of Lettuces."

"You do not seem to waste any space," I said.

"No," was the reply. "Although we are devoting three or four times as much ground to vegetables, compared with what we have done before, we still aim to produce as much food of the highest quality as the land will yield. Here you see Runner Beans in double rows, with Spinach and Celery between; in this bed we have Celeriac growing between Shallots—the latter shortly to be lifted; Lettuce is planted between rows of Celery."

A NEW ONION.

"What is that very flourishing bed of Onions?" I inquired.

"That is my new variety, named Autumn Triumph. As you say, the bulbs are of fine size. They get to be quite as large as Giant Rocca. It is one of the best things ever brought out. Seed is sown in September, and the Onions are ready for use the following May to July. They should be harvested by the next September, and will keep well for eight or nine months longer—or say until the ensuing April or May. The quality is first-class. Giant Rocca is a good Onion, but it does not keep well."

"Autumn Triumph should certainly prove an acquisition. Is it in commerce?"

"No; I have not yet placed it on the market, but hope to do this in a year or so."

"You have mentioned Celeriac; do you grow any other of the less common vegetables?"

"Practically we grow some of everything. One vegetable which I would commend to those who do not know it is Kohl Rabi. It does better than Turnips on hot soils, and if cut when about the size of small Turnips makes a most excellent dish."

At this point Mr. Beckett was called away, and therefore introduced me to his chief assistant, Mr. Pritchard, who very kindly offered to give me any information regarding the varieties grown.

"As a commencement," I replied, "will you tell me what varieties of Cabbage you find most serviceable and productive?"

PRODUCTIVE VARIETIES.

"For sowing in July and August we use Harbinger, Flower of Spring, and Ellam's Early Dwarf. The seed is sown in the open, and pricked off direct into the rows. For autumn sowing we prefer Harbinger. Then, to follow these, we sow in spring Earliest of All, Tender and True, and Favourite. These are three very productive varieties, which are ready for cutting at the end of July."

"And Cauliflowers?"

"In September we sow Walcheren and Magnum Bonum, which are pricked into frames for the winter. For spring sowing we have, first, Early Giant, then Snowden, and lastly Autumn Giant."

"How about Beans?"

"Of Broad Beans we have Leviathan; for maincrop Runners, Prizewinner and Best of All; and French Beans Canadian Wonder and Golden Waxpod."

"Besides Autumn Triumph, what other Onions do you grow?"

"Ailsa Craig, James' Keeping, and Veitch's Maincrop."

"Celery is another subject for which these gardens are famous?"

"We have two varieties that were raised here —Aldenham Pink and Aldenham White, and in addition we grow Standard Bearer, a red variety. The only Leeks are International and the Lyon."

WINTER GREENS.

"What are your winter greens, in order of gathering?"

"We commence with Brussels Sprouts Dwarf Gem; then comes Borecole or Scotch Kale; Victoria Kale, which is followed by Savoys of sorts and Purple-sprouting Broccoli; next by Cottager's Kale, and lastly Labrador Kale. These give us a long season of winter greens."

"And Beet, of which I noticed you had a quantity in front of the fruit trees?"

"There are four varieties—Sutton's Globe, Sutton's Black, Blood Red, and Cheltenham Green Top, which some people do not care for owing to the colour of the leaves, although the flesh is a good colour, and of first-rate quality."

"Potatoes and Peas I have already noted. What of Turnips and Carrots?"

"For earliest Turnips we sow Sutton's Early Forcing in frames, in February and March; this is followed by Early Milan, sown on a warm border out of doors; and then later by Early Snowball. Of Carrots we grow Champion Scarlet Horn and Favourite—two short varieties useful for early work; and New Red Intermediate for maincrop."

"There remain Tomatoes and Vegetable Marrows?"

"The three we like best are Golden Perfection, which is grown under glass, and Sutton's Winter Beauty and Carter's Sunrise. We are also trying Bide's Recruit and Kondine Red, and both seem very promising. Moore's Cream is a good all-round Vegetable Marrow, useful for early and late work. This we grow in frames, fertilising by hand. Prince Albert is good for outside, and so is Long White. Our favourite Cucumber is Ideal."

At this point Mr. Beckett returned, and offered to conduct me further round the gardens; but knowing that he is extremely busy in these days, and having, moreover, seen how enthusiastically the call for increased food production is being responded to in Aldenham House gardens, I felt that I could no longer trespass on his time, and so brought my visit to a conclusion.

W. J. CHITTENDEN.

(Next week, the gardens at Woburn Place, Addlestone, will be described.)

THE SUMMER SNOWFLAKE.

Although Leucojum æstivum is called the Summer Snowflake, it actually blooms during May. It is a bulbous plant, extremely hardy, and, while fairly well known, deserves to be more widely cultivated. The flowers are white, spotted with green, and hang on the plant like pretty, drooping bells. It rises to a height of about eighteen inches.

This Summer Snowflake is useful in many ways for the decoration of the garden. The leaves die down in summer, so that it may be planted in the herbaceous borders, between subjects that come on later, and thus make the flowering season a longer one. Another good method of employing it is to sow annuals round it, so that they will come on as the Snowflake dies down. It may also be planted at the foot of the rockery, where it will get plenty of moisture in summer.

The soil for this plant should be light and sandy, but by no means dry, for it loves moisture about its roots, and without this will not make good growth and flower freely.

AN UNCOMMON POPPY.

Shirley Poppies, Oriental Poppies, and Iceland Poppies are found in most gardens, but we do not often see Papaver pilosum, although it is as hardy and as easily grown as any of the Poppy family. It is a truly lovely thing, with its apricot coloured flowers of a silky texture, becoming almost white in the centre. The height is about two feet, and each stem bears many flowers, varying in size, but all fairly large. The foliage is covered with a woolly down, and is greyish-green in colour, thus making a handsome foil to the flowers.

P. pilosum is a hardy perennial, and may be raised from seed sown in the usual manner. If sown sufficiently early in the year, under glass, plants will bloom the same season, but they are certainly better the second year.

The flowers have the merit of lasting longer than those of the other Poppies. It is a good plan with all Poppies, before placing them in water, to cut off a small piece of the end of the stem, as the milky juice which exudes dries hard quickly, and prevents the stem from taking up moisture.

Potatos, and refrain from moving or disposing of them until he has obtained permission from the Ministry. The declaration required is:—(*a*) In the case of seed Potatos of varieties approved as immune from Wart Disease, certified whilst growing by the Scottish Board or by the Irish Department of Agriculture, a declaration by the consignor correctly stating the serial number of the relative certificate of purity. (*b*) In the case of all other seed Potatos, a declaration by the consignor correctly stating the reference number of the certificate issued not more than nine months previously by the Scottish Board or by the Irish Department of Agriculture, certifying, in the case of Scotland, that Wart Disease has not occurred on, nor within one mile of, the land on which the Potatos were grown, or, in the case of Ireland, that Wart Disease has not occurred in the locality in which the Potatos were grown. Copies of the Orders in question, the Wart Disease of Potatos (Imported Scottish Seed Potatos) Order of 1920 and the Wart Disease of Potatos (Imported Irish Seed Potatos) Order of 1921, may be obtained on application to His Majesty's Stationery Office, Imperial House, Kingsway, London, W.C., or from any bookseller, price 1d. net each.

Centenarian Gardener.—Mr. Peter Watson, who for over forty years served as gardener at Dell Lodge, Nethybridge, Inverness-shire, celebrated his one hundred and third birthday on Wednesday, August 24, in the quaint, old-world village of Kincardine-O'Neil, Aberdeenshire. His wife is in her hundredth year, having reached her ninety-ninth birthday last April. These worthy persons' record of married life is one to which few couples can hope to attain, they having celebrated the seventieth anniversary of their wedding on June 12 last. A native of Carrbridge, Inverness-shire, Mr. Watson retired from his post of gardener at Dell Lodge about twenty years ago, when he was well over eighty years of age. Some nine or ten years ago the old couple removed to Kincardine-O'Neil, where their comforts are attended to by a married daughter—Mrs. Anderson. Mr. Watson has been the recipient of many congratulations from far and near. Mrs. Watson's hundredth birthday falls in April next.

Agricultural Wages. — The Agricultural Wages Board at a meeting held on Tuesday, the 23rd ult., decided after considering the objections which had been received to their proposals to reduce the minimum rates of wages for all classes of agricultural workers, together with reports from the District Wages Committee thereon, to make orders bringing the proposed revisions in the rates into operation as from Monday, the 5th September. The effect of the new orders is to reduce the minimum rates of wages for ordinary adult male workers by 6s. per week, provided that such minimum rates shall not in any area be less than 42s. per week, and in the case of female workers aged 18 and over to reduce the hourly minimum rate to 7d. per hour, except in Yorkshire, where it will be 8d. The orders provide for proportionate reductions in the minimum rates for special classes of workers, and for boys and girls, and in the overtime rates.

Iris Conference in Paris, 1922.—The first seedling garden Irises having been raised in France, by M. de Bures, about 1822, the Société Nationale d'Horticulture de France, to mark the centenary, is organising an Iris Conference to be held at 84, rue de Grenelle, Paris, in the spring of 1922. The chief object of the Conference will be the study of the botanical and horticultural status of all the species and varieties, and especially the correct naming of the garden varieties of German Irises, I. pumila, Apogon, Xyphium, etc. Meetings will be held on various dates from April to the end of June. A general meeting will take place at the time of the spring show of the Society to discuss matters concerning the Conference. Foreign Iris specialists are invited to give to the Conference the help of their experience, and to send flowers, plants, notes, etc., on Irises.

Mr. Edwin Beckett, V.M.H.—Mr. E. Beckett is recognised as one of the most successful gardeners in Great Britain, and his successes at exhibitions have probably never been excelled by any other grower. He was born at Remenham Lodge, near Henley-on-Thames, where his father was gardener, and it was there he gained his first experience in the profession. After leaving home, he served for three years in the gardens at Marsh Mills, under the late Mr. J. Neville, who won many prizes at local exhibitions. His next move was to Greenlands, Oxfordshire, which, at that time, had one of the finest collections of hard-wooded stove and greenhouse plants in the country. Mr. Beckett was at Greenlands when the estate was purchased by the Rt. Hon. W. H. Smith, who carried out extensive alterations in the gardens and pleasure grounds, thus affording the young gardener an opportunity of acquiring valuable knowledge. In 1870, Mr. Beckett proceeded to Woodsey Grange, Esher, as foreman under Mr. G. King, whose employer, Mr. Robert Few, exhibited on a large scale, being especially fond of specimen Pelargoniums of all sorts. Mr. Beckett was then barely

MR. EDWIN BECKETT, V.M.H.

seventeen years of age. Only four years elapsed before he was appointed gardener and bailiff to Mr. J. McConnell at Moor Place, Esher, and whilst there he commenced exhibiting, winning prizes for Japanese Chrysanthemums and trained plants. On the death of Mr. McConnell, he was appointed gardener to Mr. J. P. Currie at Sandown House, Esher, and remained there for nearly four years, during which period he gained his first important successes in showing vegetables, being awarded, in 1883, at the Royal Horticultural Society's shows at South Kensington, three first prizes in keen competition with some of the best growers of the day. He also won the important prize offered by the Duke of Albany at Kingston, for a group of plants arranged for effect, a class in which leading growers of the day keenly competed. Early in 1884, Mr. Beckett was appointed gardener to Lord Aldenham, of Aldenham House, Elstree, Hertfordshire, and on the death of Lord Aldenham he continued in the office under his son, the Hon. Vicary Gibbs, who is one of the keenest amateur gardeners in this country. Mr. Gibbs, with the assistance of Mr. Beckett, has carried out extensive alterations in the gardens and grounds at Aldenham, which contain probably the finest collection of trees and shrubs in the world, and certainly the finest private collection. Mr. Beckett has gained successes at exhibitions for practically the whole of the subjects grown in gardens. He has won more than sixty gold medals at the principal exhibitions in the British Isles, and innumerable other trophies. He was awarded the Grand Prix at the International Exhibition in 1912, whilst at the Sweet Pea Bi-Centenary exhibition, besides winning several first prizes, he gained the valuable cup offered for the best exhibit in the show. He has been awarded the R.H.S. Gold Hogg Memorial Medal, and twice has received the silver Lindley Medal for exceptional merit in vegetable culture, these being on occasions when he has also been awarded the Society's gold medal for large groups of vegetables. For many years Mr. Beckett has been a member of the Fruit and Vegetable Committee of the R.H.S., and was awarded the Victoria Medal of Honour in 1906, whilst he also acted as a director of the International Horticultural exhibition in 1912. Mr. Beckett is the author of several gardening works, including *Vegetables for Home and Exhibition*, still one of the foremost and most practical volumes on the subject, *The Book of the Strawberry*, and *Roses and How to Grow Them*, whilst he is also the inventor of two or three gardening articles of note, the principal one being the cup and tube used for Chrysanthemum exhibiting, many thousands of which have been sold, whilst his patent tree-tie is also well known. Besides all this he has raised many new vegetables and plants, including Michaelmas Daisies, Streptocarpus, Pentstemons and Polyanthus. Only last autumn he gained two Awards of Merit for new varieties of Michaelmas Daisies; well over thirty Awards of Merit have been given to different varieties of Asters raised by him. His activity has been equally as great amongst vegetables, and he is the raiser of such well-known standard vegetables as Peas Quite Content and Edwin Beckett, Celeries Aldenham Pink and Aldenham White; Cucumbers Victory and Ideal; Tomato Golden Perfection, and many others. He has judged at most of the important exhibitions in Great Britain. Mr. Beckett takes an active part in local affairs; he was a member of the Aldenham Parish Council from its inception until 1919, and acted as chairman from 1904 until his retirement two years ago. He has held many other offices in the district, including that of churchwarden and school manager.

Appointments for the Ensuing Week.—Monday, September 12.—Bath Gardeners' Debating Society's meeting; United Horticultural Benefit and Provident Society's committee meeting. Wednesday, September 14.—Royal Caledonian Horticultural Society's show (2 days); East Anglian Horticultural Society's meeting, lecture by Mr. H. Goude on "Bush Fruits."

"Gardener's Chronicle" Seventy-Five Years Ago.—*Effect of Slacked Lime on Potatos.*—Enquiry having been made as to the result of the experiments made at Chatsworth with slacked lime in staying the Potato disease, Mr. Paxton has been kind enough to favour us with the following reply:—Dipping in hot slacked lime completely stops the disease. I planted the diseased tubers with the coating of lime upon them in the usual way, and they have produced as fine a crop as the sound seed near which they were grown; they showed no signs whatever of disease until it became universal, when they were affected like the rest. That hot slacked lime at once stops the disease in the tubers is certain, and also that these diseased tubers will produce a good crop; but their produce is alike under the influence of the mysterious causes of the disease. I intend performing the same operation as before, with my sets this year, hoping a season may come when we shall have no occasion for such practices, but really the aspect of affairs at present is not very flattering to its consummation. *Joseph Paxton, Chatsworth, September* 9. *Gard. Chron., September* 12, 1846.

THE GARDENS AT HEADLEY PARK, EPSOM.

Interview with Mr. Thomas Beeson.

SINCE Mr. J. Newton Mappin became the owner of Headley Park, the residence has been practically rebuilt, and the pleasure grounds have been greatly developed and improved. Mr. Mappin takes a keen interest in his garden, and has himself suggested many of the developments which have been carried out under the auspices of his gardener, Mr. Thomas Beeson, who, on a breezy winter afternoon, showed me round, and spoke, as we proceeded, in grateful acknowledgment of the support and encouragement afforded to him by his employer. Quite one of the most interesting features at Headley Park is the wild garden on the left of the drive to the mansion, which stands on high ground some six hundred feet above sea level; and it is all the more noteworthy, since it is one of the developments made during the last eleven years.

A Modern Wild Garden.

"Protected from the north and east by belts of shrubs, Conifers, and flowering trees, the wild garden," said Mr. Beeson, "was so planned that straight lines are avoided. The shrubs are planted in various widths. In making this garden, the soil was dug out and thrown in mounds, care being taken to place the top spit of earth on the top of the mounds. The best soil to plant upon was thus obtained. The grass path winds round, and has trees, Roses, and various plants on either side blossoming from February to November."

"What do you commence with?"

"Erica carnea, Magnolias, with other early-flowering trees. In the borders we start with bulbs in variety, and these are followed with Canterbury Bells, Pæonies, Roses, Lavender, Delphiniums, Aquilegias, Ericas, and Asters, all planted in masses. Brooms and Bamboos are also largely in evidence, the yellow variety of Scoparius (the common Broom) being particularly noticeable."

Flowering Shrubs.

"Which of the flowering trees and shrubs do best on the lawns and in the surrounding shrubberies?"

"Prunus Pissardi, Cerasus in variety, Almond, Laburnums, Thorns, Lilacs, Spiræas in variety, Veronicas, Olearia Haasti, Hibiscus, and Berberis. The Conifers, interspersed among the shrubs include flourishing specimens of Cupressus, Thuya, Retinospora, Juniperus, Cedrus atlantica and deodara, and Picea pungens glauca, a Spruce Fir which brightens the appearance of the lawns with its silvery foliage.

The Herbaceous Border.

"Close to the wild garden," continued Mr. Beeson, "the herbaceous border begins. As you will perceive, it is protected from searching winds by the trees and shrubs, and its effectiveness is enhanced by the winding grass paths. The more suitable varieties, in masses, are Delphiniums; Phloxes, tall and dwarf; Asters Beauty of Colwall, alpinus magnificus, amellus Bessarabicus; Anchusa italica, Dropmore variety; Anemones, Doronicums, Erigerons, Echinops, Coreopsis, Heleniums, Helianthus, Irises, Aubrietias, Arabis, Kniphofias, with quantities of Crocus and Narcissus for early flowering. The same varieties are planted more or less in the herbaceous border in other parts of the garden."

How to Decorate a Pergola.

"What varieties of Roses are represented on the splendid pergola on the croquet lawn to the right of the mansion?"

"Both on the pergola, and on the arches and pillars elsewhere, are Crimson Rambler, Dorothy Perkins, Mrs. F. W. Flight, Tausendschon, Queen Alexandra, Leuchstern, Aglaia, Psyche, Thalia, Claire Jacquier, and Waltham Rambler. You will notice that we have no formal bedding, but that there are numerous Rose beds here."

One of the Approaches to Headley Park, Epsom.

"Do you confine the beds to one variety?"

"Yes, exclusively. They are all Hybrid Teas. No Tea Roses are grown outside; the position is too high and cold."

A Water Garden.

Passing to the other side of the mansion, I asked the names of the creepers in front.

"Clematis in variety, particularly C. montana on the west side, covering the verandah; Ivies, Lonicera, Jasminums, Ampelopsis, Pyracantha, and Wistarias. On the south side of the mansion, a rockery is in course of construction."

"On a rather large scale, I gather?"

"It is being formed to make a nearer path to the walled garden. Messrs. Pulham and Sons are making the steps of rock, and interspersing pieces amongst the plants. On the east side of the mansion is a water garden, which was completed in the spring of 1907. The winding stream, varying in width, with the water falling at intervals over rock, materially adds to its beauty. Messrs. Pulham also built the rock, the stream and planting being carried out by the staff. Bulbs are thickly planted in the grass on each side of the stream, Water Lilies in the stream, while plants, shrubs, and weeping trees form an imposing background. Before we leave the pleasure grounds, you may like to make a note of the two large tennis-courts, one above the other, with a summer-house at the side. At present we get to the walled gardens by a path through the shrubbery, with a grotto on one side. From here there is a road which leads to the village."

The Walled Garden.

"The walled gardens are finely situated," I said, as we walked towards the striking range of glasshouses, with Roses on either side, and a Rose arch in the centre.

"The Roses, except on the arch, are grown for cutting. On one side of the arch, which we pass under to enter the houses, are early-flowering Chrysanthemums, and then come Sweet Peas, grown in circles."

Begonias Flowering Six Months.

"How long have these delightful Begonias been in flower?" I enquired, as we opened the door of a house, which inside was a blaze of pink.

"Since early in September. I prefer the Gloire de Lorraine, and The King, to the newer varieties of Begonias. These will remain in flower until the end of January. We use them largely for decoration, the pots being suspended by wire slipped underneath. In this house we get two crops of Melons. Only two green-fleshed varieties are grown, these being Ringleader and Windsor Castle."

"Do you show Begonias?"

"Locally, at Croydon and Epsom only. To take the houses as we proceed, the next is an early Peach house, full of Nectarines, from which we pick during the latter half of June. The varieties are Humboldt, Pitmaston Orange, Early Rivers, Victoria, Lord Napier, and Pineapple."

Orchids and Ferns.

"And the next, an Orchid house?"

"Yes, but it is partly filled with Ferns. The Orchids are Cattleyas and Dendrobiums, with some good specimens of D. nobile; and the Ferns include varieties of Nephrolepis, Adiantums, Asparagus, and Polypodiums. The Nephrolepis have seeded themselves. The wall is covered with Ficus repens. The adjacent Vinery is devoted to Muscats, planted five years ago, with an inside border. The third year we cut four bunches of Grapes from each Vine; now they yield a dozen. Now we come into the two show houses. By this I mean that both are used for masses of flowers in pots."

"Such as the remarkable display of Chrysanthemums I see now?"

"Yes, just according to the season. Most of

Digitized by Google Original from CORNELL UNIVERSITY

these Chrysanthemums are Singles and Decorative. We grow three hundred Japanese, a few Incurved, and five hundred Singles and Decoratives."

Methods of Cultivation.

"When do you strike your Chrysanthemums?"

"Early in December in a frame on a hotbed of leaves. I put four in a large 'sixty,' and pot on in January, transferring the plants into 6-in. pots in March. In March I take cuttings to grow single blooms on one stem in 6-in. or 7-in. pots. The compost for these pots is composed of ten barrows of loam, two and a half each of leaf-mould and horse manure, one and a half of mortar rubble, three-quarters each of wood ashes and silver sand, and one and a half 8-in. pots of soot, to each barrowful being added one 5-in. pot of bonemeal. Pinching is adhered to in order to produce flowers for special dates. The plants are moved from the frames outside as soon as weather permits into the Chrysanthemum ground, which covers several rods."

"How do you arrange them?"

"We put them in rows on wires from north to south, in a sheltered part of the kitchen garden. The final potting into the flowering pots is done in June. The compost for all the final pots consists of twenty barrows of loam, four of leaf-mould, five and a half of horse droppings, three of mortar rubble, one and a half of wood ashes, three 8-in. pots of soot, to each barrowful being added one 6-in. pot of bonemeal."

"When are the plants housed?"

"This season they came in on September 20th, and the supply lasts until February."

Seedling Schizanthus.

"Do you show Chrysanthemums at Epsom and Croydon?"

"Yes. At Croydon we won the champion challenge bowl in 1907 and 1908, in open classes, with five competitors, losing by a point in 1909, and winning again this year, when there was only one exhibitor against us. At Epsom we won a pair of silver candlesticks, a silver Rose bowl, and a cup for large-flowering Chrysanthemums, and on other occasions a number of firsts. In addition to Begonias, I have also shown fruit and vegetables successfully."

"What will follow your Chrysanthemums as the feature of the show houses?"

"Already the Tree Carnations are flowering largely. The varieties of these are principally Britannia, Enchantress, Mrs. H. Burnett, Mrs. T. W. Lawson, White Perfection, White Enchantress, and Winsor. We have next Cineraria stellata Felton's Beauty, about two hundred, and Schizanthus, a selection of my own which were sown, in the first instance, nine years ago. They are Sutton's strain, retusus and Wisetonensis crossed. I have a stage full of Schizanthus."

"How often do you sow the seeds?"

"Each year I keep them carefully labelled, and select the most promising varieties from all the plants. The stage facing the Schizanthus will be occupied with herbaceous Calceolarias, and the centre of the house with Lilium longiflorum or Pelargoniums in variety."

Headley Park, Epsom, Surrey.

The Treatment of Herbaceous Calceolarias.

"How do you treat herbaceous Calceolarias?"

"They are sown in June in pots or pans, seeds being raised in a cold frame, pricked out in small 'sixty' size pots when large enough, kept cool, and potted again in 'forty-eight' size pots in autumn. In January they are placed in their final pots, 'twenty-four' size. The compost used is three parts fibrous loam, one part leaf-mould, with sufficient mortar rubble and sand to make the compost open, and keep it sweet. The worst enemy of herbaceous Calceolarias is the aphis, and we fight it by fumigating the plants frequently, and spraying occasionally with weak soot-water. In the next house there are Malmaison Carnations on the side stages, Arum Lilies on the back spaces, and the whole of the centre stage is filled with Roses. They come in about the middle of April. The varieties of Malmaisons are Princess of Wales, Nautilus, Lady Rose, Duchess of Westminster, Nell Gwynne, Trumpeter, and Mr. Martin Smith."

A Pretty Stream at Headley Park, Epsom.

Roses in Pots.

"When do you repot Roses?"

"Early in November. They are placed under lights to protect them from excessive rain, and pruned and taken in a cool house early in January. At the end of that month we place them in a Vinery, so that they start into growth with the Vines. The potting compost is mainly composed of stiff loam with a little rotten manure, leaf-mould, bonemeal, mortar rubble, and sand. The varieties we prefer are The Bride, Mrs. John Laing, La France, Caroline Testout, Frau Karl Druschki, Viscountess Folkestone, Dean Hole, and Mildred Grant. Behind the Roses we have Gloxinias, Fuchsias, Liliums, and Campanula pyramidalis. Of the remaining houses, one is a Vinery with four rods of Black Hamburgh, two of Madresfield Court, and three of Alicante; the other is the late Peach house, in which, however, only Nectarines are grown, the varieties being identical with those in the early house."

Plums on Walls.

"How large is the kitchen garden within walls?"

"Two acres. Plums, you will see, are our chief fruit on the walls. The chalk soil suits them. We always get a fair crop, and very often a large one. They are protected in the spring, and we root-prune the trees until they get established. There are three divisions of the kitchen garden, and, in one of these alone, we have as many as twenty-eight fan-trained Plum trees. The varieties include Greengage, Jefferson, Early Orleans, Grand Duke, Monarch, Kirke's, and Coe's Golden Drop. Small fruits also do well."

"Such as Strawberries?"

"Yes, and I find that to get a good result from the first planting of Strawberries, it is necessary both to layer early in pots, and to make the beds early. I plant fairly closely, and get rid of every other plant the following year. The varieties are Royal Sovereign, Sir J. Paxton, Givon's Late Prolific, Kentish Favourite, and Latest of All. We get very heavy crops of Gooseberries, Cucumbers, and Raspberries."

"You do not appear to have either cages or netting?"

Digitized by Google Original from CORNELL UNIVERSITY

"I recently did away with protection for the trees, and, as an alternative, I spray them in winter at intervals, according to the weather, with insecticide, which renders the buds objectionable to the birds, and keeps the trees perfectly clean. With regard to Raspberries, I make a new plantation every fifth year. They often fail for want of renewal, unless there is great stability of soil. For the plantation I grow Superlative, Fillbasket, and Antwerp, and on a south wall I planted Early Sulphur Gooseberries five years ago—cordon trees, which have done remarkably well. Black Currants are fan-trained on a north wall, and, by this means, we get a late supply of fruit."

Apples for an Arch.

"When was your Apple arch planted?"

"Six years ago, with a dozen each of eight varieties, from all of which I get excellent results. The varieties are King of Pippins, Lane's Prince Albert, Cox's Orange Pippin, Dumelow's Seedling, Newton Wonder, Ribston Pippin, Beauty of Bath, and Allington Pippin. Apples are also grown on espaliers, and in an orchard. Five years ago I planted a young orchard entirely with Apples, chiefly of the varieties on the arch, and, in addition, Worcester Pearmain, Emperor Alexander, Peasgood's Nonsuch, Cox's Pomona, and Lord Derby. The soil does not suit Pears, and we have given up growing Peaches outside."

How to Secure a Succession of Peas.

"But you grow a great quantity of vegetables?"

"I have always been fond of vegetable culture, naturally attaching primary importance to the most general favourite—I allude to Peas. Of these, I have to furnish a supply daily in the season, beginning early in June, and continuing until the end of August, when the family go away. If they are at home, I pick until October. The varieties grown in succession are Veitch's Selected, Early Giant, Gradus, Telephone, Prizewinner, Ne Plus Ultra, Prodigy, Gladstone, Lord Rosebery, and Autocrat."

"Do you make a point of sowing Peas early?"

"It is almost impossible to sow too early. The warmest spot in the garden should be chosen for the first sowing, and a round variety selected. It is worth while to sow the Marrowfats in pots or boxes, placing them in a frame or some structure to keep the soil in a moderately dry condition until the seeds germinate. I transfer to the open ground when the plants are about two inches high, but take care to keep them hardy, so as to ensure sturdy growth. For a few nights I protect with boughs of Yews or Laurels, removing them in the day-time. I continue to sow at intervals until June, selecting the varieties which I find from experience suit the soil. In order to prevent mice and birds from taking the seeds, I slightly damp them, and sprinkle with red-lead before sowing."

"Your Celery looks exceedingly flourishing."

"I attribute my success in Celery cultivation mainly to the fact that I plant in very shallow trenches. Between the trenches I always crop Lettuces, Spinach, and Turnips. In December I set out all the vegetable crops in the spaces for the following year, and know exactly, then, how to work the ground. My system is to turn up every piece of ground, and expose it to bad weather, such as frost and snow."

The Renewal of Asparagus Beds.

"Is Asparagus a great feature?"

"I do not force it, but I have seven large beds. Every other year I sow a small packet of seed, make up a fresh bed, and when that is established, chop out one of the old beds. It is a mistake to suppose Asparagus beds last for ever. No bed should be kept longer than fourteen years, or the ground must inevitably get sour."

A Reliable Cabbage.

"How about Potatoes?"

"In the pits I force Ashleaf Kidneys, and a few May Queen. Each pit consists of two lights, and will hold five cartloads of leaves and hay litter. Carrots and Radishes are forced as well as Potatoes, but four three-light frames are devoted entirely to Lettuce. I keep Cos Lettuce going up to the end of January. With respect to the Brassica tribe, the seeds of Cabbage should be sown in August, and, when large enough, pricked out two feet apart in rows, and eighteen to twenty-one inches from plant to plant. One of the most reliable varieties is Flower of Spring. Tender and True is good for the summer supply, and may be followed with the Savoy Cabbage Perfection. I have a very fine breadth of Brussels Sprouts, and I still think, after eleven years of experience, that Dwarf Gem is the best variety. Cauliflowers, Broccoli, Beans, Onions, and, in fact, all other vegetables, thrive on the soil, and under the conditions I have already described."

Herbaceous Calceolarias at Headley Park, Epsom.

"I notice that there is a bothy in two divisions of the kitchen garden."

"Each has accommodation for four inmates. One is brick, and the other iron, thatched with Heather, and has a double iron roof. The Heather is a foot thick, and keeps the bothy cool in summer, and warm in winter. Mr. Mappin is most considerate to his employees."

"What was your own experience before you came here as head gardener eleven years ago?"

"I was in succession for four years at Selsdon Park, two years at Newberries, Redhill, two years at Childwickbury, and five years foreman in the gardens of the late Mr. Martin Smith, at Hayes." ALFRED WILCOX.

IN next week's interview will be found a description of the gardens at Lord Burnham's Buckinghamshire seat, Hall Barn, Beaconsfield.

Morisia Hypogæa.

SUCH Alpine flowers as Morisia hypogea are always held in high regard by cultivators, and it is little wonder that it has been largely grown since its re-introduction to our British gardens in 1890, when it was sent out as a new plant. This was an error, however, as was stated in the horticultural journals of the time, seeing that it was first flowered in this country in April, 1834, and was figured in Sweet's "British Flower garden," Series II., tab. 190. Its history in this country is that it was introduced from seeds given to Mrs. Palliser from the Valentino Botanic Garden, Turin, by Professor Moris, who found the plant in the Sardinian mountains, and in whose honour it is named. It was figured in a coloured plate in one of the horticultural journals in 1891, but the illustration, excellent though it is, does not show the beautiful polished appearance of the foliage—a feature of the plant which adds much to its beauty.

The Morisia is a plant of considerable interest botanically, seeing that it is a monotypic one, no other being included in its genus, and that it is one of the flowers which bury their seed-pods in the soil, after the fashion of the Earth-nut, Arachis hypogæ.

Decorative Foliage.

In the garden it is cherished for its intrinsic beauty, the tufted runcinate leaves of a polished green giving it much ornamental value, while almost resting on these leaves are a number of bright yellow flowers, rather less in size than a shilling, and borne singly on very short stalks.

The fact that this pretty plant had to be re-introduced after a considerable lapse of time points to its being one not so absolutely easy to cultivate as its appearance suggests, although the neglect of hardy flowers which followed the introduction of the bedding system, had probably a good deal to do with its disappearance from our gardens. But it has a curious habit of dying off in some gardens—a habit not altogether easy to account for.

Soil and Culture.

The Morisia seems to like a rather shady position in a light soil, not too dry, however, in spring and summer, and I have seen it do splendidly where surfaced with a layer of pure sand, which served the double purpose of keeping the plant dry above, and of preventing evaporation from the soil beneath. In this medium the seeds seem also to germinate better than anywhere else. A rich soil beneath and sand above appears, therefore, to suit this charming little plant, which, where it is happy, will spread somewhat, and look more flourishing than when in a hot, dry place.

Propagation is easily effected by means of root-cuttings, secured by lifting a plant in early autumn, and cutting the roots in pieces about two inches in length, inserting these thick-end up in sandy soil in pots, with the top just at the surface. If these pots are placed in a cool or slightly heated house or frame, growths will appear in spring on the surface, and small plants will develop, which can be potted off singly to plant out when strong enough.

Division of large plants may also be practised in spring or autumn, but, on the whole, root-cuttings present the readiest method of increasing the stock. S. ARNOTT.

Digitized by Google Original from CORNELL UNIVERSITY

better conditions than those obtaining generally, and said that the results more than repaid him for the work. He believed that methods that would pay when practised for small quantities would pay proportionately well if applied to larger numbers.

Mr. Alex. Dean said it was an advantage to have the tubers make sprouts before planting, because if any of the tubers had become mixed they could generally be identified more easily by the sprouts, and these, together with "blind" tubers, of which there were generally some, could be removed before planting was done, thus preventing gaps that would occur otherwise. He strongly supported the lecturer's recommendations, and declared that such means of storage would be remunerative in all cases.

ROYAL BOTANIC.

October 12.—The autumn show of the Society was held in Regent's Park on the above date, the weather being all that could be desired. The number of entries was small, but a splendid collection of vegetables, staged by Lord Aldenham's gardener, Mr. Beckett, was in itself an excellent feature, and an object-lesson in the culture of good vegetables. Several collections of hardy flowers, well-grown stove and greenhouse plants, dishes of hardy fruits, bunches of Grapes, &c., were the principal features. Several miscellaneous sundries, such as stakes, ladders, tubs for plants, &c., were also prominent.

Lord Aldenham, Aldenham House, Elstree (gr. Mr. Beckett), set up a collection of vegetables in his usual superb style. All the varieties were shown in perfect condition, and occupied about 50 feet run of tabling. Cauliflowers were excellent, Early Emperor, Dwarf Mammoth, Early Autumn Giant, Walcheren, &c. Celery was of large size and of excellent quality. Onions were also strikingly displayed, large well-shaped bulbs of Ailsa Craig, Record, Excelsior, &c., being noticed. Excellent pods of The Gladstone and Autocrat Peas were included. Carrots and Parsnips were also noteworthy, indeed the whole display, including Tomatos, Potatos, Turnips, Beans, Endive, Lettuce, Spinach, Brussels-Sprouts, Cucumbers, Leeks, Kale, &c., was presented in the first-class style for which this grower is famous (Large Gold Medal).

Messrs. John Laing & Sons, The Nurseries, Forest Hill, London, staged an extensive group of ornamental shrubs and Conifers, also a batch of Clematis in flower (Large Silver Medal).

Mr. Eric F. Such, Maidenhead, staged vases of Chrysanthemums, perennial Asters, Solidago, &c., working in the group Gynerium argenteum, and coloured Oak-foliage, &c. The Chrysanthemums were of such varieties as are used for cut flowers and market purposes.

Miss Adamson, South Villa, Regent's Park, staged a collection of stove and greenhouse plants, Begonias, Codiæums, Dracænas, Caladiums, Celosias, &c., very tastefully arranged. A number of well-flowered plants of Cattleya labiata occupied the centre of this group. Adjoining were examples of several varieties of Grapes from the same gardens, Black Hamburgh, Muscat of Alexandria, Black Alicante, Buckland Sweetwater, &c. Bunches of Tomatos and sprays of Ficus radicans were arranged round the Grape-stands with good effect. (Large Silver Medal).

Messrs. T. S. Ware, Ltd., Feltham, Middlesex, set up an attractive group of hardy flowers, Asters, Chrysanthemums, Gladioli, Liliums, Phlox, Pyrethrums, &c. Senecio pulcher was very pleasing with its bright rosy-purple petals. Anemone japonica Queen Charlotte was also noticeable (Large Silver-gilt Medal).

Messrs. Wm. Cutbush & Son, Highgate, N., arranged an extensive group of hardy plants in first-class style. Perennial Asters were conspicuous in many desirable varieties; also smaller-flowering Chrysanthemums from the open. Several pans of Colchicums, C. autumnale album, C. a. flore-pleno, &c., also Crocus zonatus, were well flowered. Among the Asters was a dwarf variety, for which the Society gave a Certificate of Merit. The colour is white, similar to A. candida, but the growth only reaches a height of about 12 inches (Silver-gilt Medal).

Messrs. S. Spooner & Sons, Hounslow Nurseries, Middlesex, staged a meritorious collection of Apples and Pears. An excellent dish of Cox's Orange Pippin was noticed, also one of Lord Derby. Emperor Alexander, Bismarck, Striped Beaufin, Wealthy, Lane's Prince Albert, &c. Some good examples of Beurré Diel Pear were seen (Silver Medal).

Hobbies, Ltd., Norfolk Nurseries, Dereham, set up several vases of Cactus Dahlia blooms. Some of the flowers gave evidence of the lateness of the season for these flowers.

The Four Oaks Sundries Co., Sutton Coldfield, Birmingham, sent several of their appliances, including a pocket secateur which should prove useful to Rose-growers and others.

Messrs. Ambrose & Co., The Nurseries, Cheshunt, brought a bunch of their new Grape Melton Constable, with foliage, which was brilliantly coloured.

GARDENERS' DEBATING SOCIETIES.

REDHILL, REIGATE, AND DISTRICT GARDENERS'.—The fortnightly meeting was held in St. Matthew's Schoolroom on Tuesday, September 27, the lecturer being Mr. A. Trowers, whose subject was "Spring Gardening." Over 100 members were present. Mr. Trowers clearly showed that a very great amount of pleasure may be obtained by naturalising bulbs in grass. The most satisfactory soil for this purpose was stated to be good medium loam. Mr. Trower strongly advised growers to plant strong, sound bulbs.

LOUGHBOROUGH AND DISTRICT GARDENERS'.—The Annual Meeting of the members of this Association was held in the Town Hall on Tuesday, September 27. In the unavoidable absence of the President, W. C. Burder, Esq., Mr. J. T. Smith, Chairman of Committee, presided. The funds show a balance in favour of the Society. The report and balance-sheet, read by the Hon. Sec., Mr. D. Roberts, were adopted. The President was thanked for his services and unanimously re-elected. The Committee were elected, Mr. W. H. Cooke, gardener Kingston Hall, and Mr. H. Hawkes, of Garendon Park, being selected in the place of two retiring members. The Chairman of Committee, Mr. J. T. Smith, Vice-Chairman Mr. J. Lane, Hon. Treasurer Mr. A. McVinish, and Hon. Sec. Mr. D. Roberts, were all re-elected. The Annual Dinner was held at the King's Head Hotel after the meeting, about thirty members and friends participating in the repast.

KINGSTON GARDENERS'.—The first meeting of this newly-formed society was held on September 30, when a lecture was delivered by Mr. E. H. Jenkins, President of the Society, on "Daffodils." Messrs. Barr & Sons supplied specimens of bulbs illustrating the lecture. After dealing with the evolution of the Daffodil, and mentioning the labours of Leeds, Backhouse, Barr, and Engleheart in producing new varieties, Mr. Jenkins gave full details of the cultivation they require. The chief points dealt with were soils, suitable and otherwise; the superiority of British over continental-grown bulbs; planting in grass; the benefit many varieties derive from association with plants in the herbaceous border or beds and with grass; the stronger growth of deeply-buried bulbs, and detailed directions on forcing. *J. T. B.*

HEADLEY GARDENERS'.—On September 30 Mr. H. Wright gave the second part of his lecture on "The Potato." Very fine specimen plants of Up-to-Date and Northern Star were brought by some of the gardeners of the neighbourhood. The lecturer remarked that "Up-to-Date" Potato, as shown by the splendid root produced, was steadily improving in spite of the predictions of many that it would gradually deteriorate, while Northern Star, although producing an enormous number of tubers, would never attain great popularity. Being of a peculiar constitution it had a great tendency to grow out and make long underground stems before producing tubers, and this independent of season or soil, as the verdict from the best Potato lands in the country, Dunbar, Edinburgh, Lincoln, the Fens, was substantially the same.

CARDIFF GARDENERS'.—The opening meeting of Session 1904—5 took place at the Sandringham Hotel on Tuesday, October 4, when the President (J. Lynn Thomas, C.B., F.R.C.S., J.P.), occupied the chair, supported by the President of the Cardiff and District Chrysanthemum Society (J. W. Courtis, Esq., J.P.), and a very large attendance of members. Professor Trow, of the University College, Cardiff, delivered a lecture entitled "The Chief Work of Plants," illustrated with lantern views, and from an educational point of view the lecture proved to be highly interesting and was very much appreciated. Mr. T. Clarke, on behalf of the members, presented the President with an engraving of the group of members who attended the Reading outing in August last. Several new members were enrolled.

TRADE NOTICE.

Mr. Geo. Springthorpe, late of West Leigh Nursery, Leicester, has removed to Maycroft, St. Albans Road, Kingston-on-Thames.

Obituary.

Edward Bennett.—This well-known gardener died at his residence at Ash Vale, near Aldershot, on October 8, aged seventy-eight years. Edward Bennett came to the fore in the early sixties as an exhibitor of fruit, &c., from Osberton Manor, Worksop, the residence of G. S. Foljambe, Esq. In this capacity he exhibited fruit at the Great International Horticultural Exhibition held at South Kensington in 1866, when a dish of fruit of the Vanilla secured a valuable extra prize. From Osberton he appears to have passed into Enville Hall, Stourbridge, and being greatly interested in the bedding-out system, at that time so popular, he made Enville famous for the extent and elaborateness of the outdoor bedding arrangements. While there he took a great interest in the series of international Potato exhibitions then being held at the Crystal Palace, and was the means of largely introducing the once popular "Schoolmaster" Potato to notice, though it was said to have been raised by another Mr. E. Bennett, a private gentleman residing near Enville. He ultimately became gardener to the Marquis of Salisbury at Hatfield, and while there applied the system of lime-kiln heating introduced by Mr. Jno. Cowan, in the efficiency of which he became an ardent believer, though it was eventually abandoned. While at Enville, and also at Hatfield, he took a warm interest in horticultural matters, and his services as a judge at flower shows were in frequent request. On leaving Hatfield he became a grower of fruit for market near Potters Bar, and ultimately dropped out of horticultural circles. He was a man of singular activity and tenacity of purpose, his cheery optimism always making him an agreeable companion.

THE APIARY.

All colonies should be put in proper order for the winter as soon as possible. Choose a day that is not too hot, or the bees will be on the wing and a nuisance to the worker. Draw back each frame and examine the ends and bottom bar, also the floor board, for wax grubs, and destroy any that are found. Remove all pollen-clogged frames and allow the bees enough frames only to fill properly—say eight or nine, removing the remainder for extracting, or place in a colony not so well off for food. Do the extracting away from the hives, and after it has been done place the frames in the hives for the bees to clear out, but in no case leave them outside even at a good distance from the hive or robbery will ensue. The colony should not be kept open longer than possible. Should a number of bees be on the frame, hold it in the left hand and brush the bees off gently into the hive with a small brush. The frame of honey taken should be immediately removed and covered over from the bees. Do not scrape the top bars as this allows the bees more room to crawl about. For a covering place next to the frames a piece of calico, with a hole cut in the centre to place on a cake of candy later on. After this has been done add an extra blanket and also several thicknesses of brown-paper, running from back to front and from side to side. Make a note as you proceed as to condition of each hive, &c. Have carbolic solution at hand to put cloth down at the entrance in case of "robbing," which should be at once stopped. Plenty of fuel should be at hand as well for the smoker, and a few flakes or lumps of naphthaline put in each hive on the top quilt and also in the back of the hive. Reduce the entrance to enable only a few bees to enter at a time. When the entrance is deep, cover it over with a little queen-excluder zinc to prevent mice from getting into the hive. All roofs should be properly secured for the rainy weather. In damp places the hives will require to be lifted. Rest them on bricks, with pieces of wood on top of the bricks. All feeding in a liquid state should be accomplished as soon as possible, and if the bees do not take syrup fast enough give it them warm. *Expert.*

ANSWERS TO CORRESPONDENTS.

Books: *G. H. L. Elementary Botany*, by Percy Groom, M.A., published by George Bell & Sons, London.

Carnation Disease: *S. S.* Your plants are affected with eel-worm. Burn the affected plants and sterilise the soil before potting fresh plants.

Carnations: *Dickson.* This appears to be the early stage of the fungus Helminthosporium. Send specimens again in a week or two, meanwhile syringe the plants with liver-of-sulphur ½ oz. to 1 gallon of water. This may do good, and can do no harm.

Chestnut and Hazel: *Selsdon.* If the plantation is intended for coppice, it would be as

THE GARDENS AT SUMMERS PLACE, BILLINGSHURST.

Interview with Mr. H. Best.

THE charming gardens at Summers Place, which I visited by the courtesy of Mr. F. D. Leyland, soon after Easter, are approached from the road by a pleasant drive, which, though a considerable quantity of Daffodils have been naturalised at the side, does not give an idea of the many features of interest which lie beyond the house. The latter is practically clothed with Ivy, carefully clipped, and facing the front door is a large flower bed.

"At present," said Mr. Best, the head gardener, who met me on my arrival, "this bed contains three varieties of Tulips—Murillo Albano (the favourite), La Grandeur, and Rex Rubrorum, edged with Myosotis. In summer there is a row of Dahlias at the back, then a row of Pentstemons, next a row of Calceolaria Golden Gem, alternating with Alonsoas, with Ivy-leaf Geraniums in front, edged by Lobelias and Pyrethrums, alternating.

"The conservatory," continued Mr. Best, as we entered an admirably planned, capacious, and lofty building, "is always a centre of interest, and instead of plants in bloom being kept in a greenhouse, they are brought here in pots."

How to Fill a Conservatory.

"The conservatory is decorated with such brilliant effect that I should be glad if you would tell me the scheme of arrangement."

"You see, first of all, that there are masses of Cyclamen and of Cinerarias, Sutton's Superb and stellata. In the middle of the stage are Eupatoriums (white), Schizanthus, Cinerarias, Amaryllis (a fine scarlet), and Tulips (Carmine Brilliant). On the lower shelf are chiefly Begonias (Gloire de Lorraine), Hyacinths (blue and pink), and Primula Kewensis. At the sides are Arum Lilies, a few Ferns, a few Azaleas, Grevillea, and Deutzia gracilis, while suspended from the ceiling are four baskets of Asparagus Sprengeri. With the exception of these baskets, and a few climbers on the walls, all the plants are in pots. The climbers are principally Roses (Niphetos) and Bougainvillea glabra. There is a specimen plant of the latter grown in a pot, balloon shape, from which we get a mass of flower. Of course, there are constant changes, but save in a portion of the London season, the conservatory is always decorated as completely as it is to-day; and there are literally flowers in it all the year round."

"Some of your Cyclamens must be remarkable for their size and number of blooms."

"I had one this season, Sutton's Giant, with thirty-nine blooms on it. The average size is, I think, good. I have a double Cyclamen, but it is not yet in full bloom. Plants are not brought into the conservatory until they are in full bloom."

The Treatment of Cyclamen.

"What is your treatment of Cyclamen?"

"I sow the seed in August and September, using shallow pans for the purpose, and placing each seed about an inch apart. By this means I avoid the necessity of moving the seedlings until they are potted off into thumb pots in January. The pans are placed on a shelf in the stove. I move to a cooler house in April, and repot as required. For the final potting, I find 6-in. pots suitable. In May I place the plants in a cold frame—one with a cool ash bottom, and facing north, is much the best. Cyclamen must be shaded from the hot sun, and syringed twice daily. If the lights are removed in the evening after bright days, the heavy night dews will do the plants a vast amount of good. Fumigating must be done occasionally, otherwise thrips may inflict much damage. In October I take the plants to a house with a temperature of about fifty degrees, and give them as much sun and light as possible. Blooms soon commence to appear under these conditions, and with proper attention to watering, and picking-off decayed leaves and flowers, the plants go on flowering until the following May."

MR. H. BEST.

Schizanthus and Cinerarias.

"Your Schizanthus are coming on splendidly."

"They run from eighteen inches to four feet in height, and the value of the trusses of flower is greatly augmented by the fine foliage. They are very useful for table decorations, and last for five days in water. I get a mixed packet of Sutton's hybrids, and give them cool treatment, as Cinerarias."

"As your Cinerarias also look so flourishing, I should like to know your system of cultivation."

"I shall be all the more pleased to explain it to you, because I think that, for house and conservatory decoration in spring, the Cineraria is one of the most useful plants. Another point in its favour is that it is quite easy to grow. At all times it requires a very cool treatment. I sow the seed in June, and as soon as the seedlings are large enough to handle, I prick them off into pans or boxes. Keeping them shaded and syringed, I can get them large enough for 3-in. pots. When these pots are full of roots, I move the plants into 5-in. or 6-in. sizes, which are very convenient for flowering them in. Cinerarias are better wintered in a house with sufficient pipe heat to keep out frost, such as a Vinery or Peach house, but this is not absolutely necessary. I have kept plants in a cold frame all through the winter, and they did very well, so long as they were covered up every night to exclude the frost. As soon as flower-spikes begin to show, I find that a little manure or soot-water is beneficial."

An All-the-Year-Round Garden.

As we left the conservatory, which is of its kind quite a model, I enquired whether the pleasure garden is kept up all the year, and Mr. Best rejoined,

"It is altogether an all-the-year-round garden. The spring bedding, in a corner on one side of the house, consists of Wallflowers—Blood-red, Cloth of Gold, and Sutton's Dwarf Bedder, which are followed in summer by Geraniums and Heliotropes."

"We may as well take the contents of other beds as we pass them, unless they are formal."

"No, there is nothing formal, the object in view being to have masses of colour in different parts of the garden, and to come upon them unexpectedly. Here are several beds, filled for spring with Hyacinths, or Tulips, of the varieties already mentioned, all edged with Myosotis; these are also succeeded in summer by Geraniums and Heliotropes, edged by Ageratums or Lobelias. Of course, the beds vary each year. Here are two beds, now occupied with dark and light blue Hyacinths, edged with Myosotis, whose places will in due time be taken by Phlox Drummondii, grown from a packet of mixed seeds, edged by Lobelias and Pyrethrums. Near these is a bed of pink and white Hyacinths, which we shall presently fill in with Heliotropes, dot with Nicotiana affinis, and edge with Geraniums Little Trot. The aspect at this point is north, and therefore we have here a late herbaceous border. Just now, you see it contains Daffodils right along, edged with London Pride. Features later on are Anemone japonica, Tritomas, Phlox, and Irises in variety."

Bedding Combinations.

Passing along the lawn, which is rich in two stately Cedars, golden Cupressus, and still has other relics of the past in the shape of Apple trees (including Red Astrachan), we came to another long border, devoted mainly to Montbretias, Phloxes, Michaelmas Daisies, and Roses.

"There is a bed of Pæonies in the centre," I observed.

"Yes, they come on after the Daffodils die down. By the way, the Daffodils are edged with Crocuses, which we find very useful. The fine red flowers of the Pæonies make a good show during June in big vases. We cut the plants down in the autumn, and give them a nice top-dressing of manure."

Digitized by Google Original from CORNELL UNIVERSITY

"You have more combinations of Hyacinths. What are these succeeded by?"

"Ten-week Stocks, with a panel of red Cannas in the centre, edged by Lobelias and Pyrethrums. Then there are two Rose beds, one with Crimson Rambler as an umbrella. Just outside is Church Walk, where we have a great show of Rhododendrons at the end of May."

"What follows your bed of Tulips here?"

"Zinnias grown from seed of various colours. They make a nice show, edged with Geranium Little Trot."

"The bedding combinations are very interesting, and your beds have the advantage of being on undulating ground."

"There is no doubt that they are more effective than they would be on flat ground. Of the two we are approaching now, filled with Wallflowers, edged by double white Arabis, one will later contain single Dahlias, and the other Pompones in variety, chosen for brilliance of colour, edged with Linum. Another combination, following Tulips, will be standard Heliotropes in the centre, with Lobelia cardinalis, filled in subsequently with Asters in variety, and edged by small Coleus. In the two beds of red, white, and blue Hyacinths which correspond, there will be dark Heliotropes (Lord Roberts), and Cannas in the centre, and an edging of Geranium Little Trot."

Sweet Peas in Clumps.

"In this corner," continued Mr. Best, "I grow clumps of Sweet Peas of one variety. They are sown in pots early in January, hardened off, and, if the weather permits, planted out in April."

At this point my attention was attracted by the number of Yews, and the beauty of the Yew hedges. From the summer houses there is a fine perspective of the sundial, and the Yews forming different shapes, right on to the house. The great number of specimen trees and shrubs also impressed me, and I asked for the names of some of them.

Trees and Shrubs.

"The collection of trees, most of them planted in 1880, embraces many varieties of Abies, Piceas, Pinus, Elms, Planes, Chestnuts, Sycamores, Poplars, Catalpas, English Yews, Pyrus, Cedars, Cryptomerias, Wellingtonias gigantea and g. pendula, Araucarias, Cupressus (notably erecta viridis), Juniperus, the Maidenhair tree, the Judas tree, Liquidambars, Tulip trees, Thujas (of which occidentalis is largely used for hedges), and many others. As to shrubs, flowering and otherwise, they include Rhododendrons, Hollies, Laurustinus, Cotoneasters, Sambucus, Syringas, Kalmias, Andromedas, Mahonias, Retinospora, variegated Acers, Berberis, flowering Almonds, Clematis, Olearia Haasti, Loniceras and Lilacs (Charles X., alba grandiflora and aurea elegantissima)."

SUMMERS PLACE, BILLINGSHURST.

A Rockery Two Years Old.

"You have a fine situation for your rockery?"

"Yes, it is on very high ground, but it needs wire to protect it from rabbits. Less than two years ago it was a rubbish heap, and it required some thought to plan it out, as I wished to combine Roses with the rock plants. The rockery is fifteen yards long and three yards wide."

"What are its principal contents?"

"There are too many to mention, but I grow, in quantity, Veronica prostratum, Primulas in variety, Sedums in variety, Aubrietias in variety, Androsace tomentosum, Aster Asteroides, Geranium grandiflorum, Lithospermum prostratum, Gentiana acaulis, Papaver alpinus, Arabis rosea, Linaria macedonica, and Cyclamen africanus. All round the Yew hedge are Montbretias, which, as you can judge, do extremely well. I never do anything to them except cut them down and clear them off. The Roses in the special bed are Killarney, Robert Scott, and Kaiserin Augusta Victoria."

"You have more Rose-beds on the other side of the Yew hedges."

"They are chiefly Caroline Testout, Mrs. Paul, Duke of Edinburgh, and Frau Karl Druschki. Crimson Rambler and Dorothy Perkins are grown on poles, with Crocuses at the foot, for spring, and subsequently Nigella Miss Jekyll."

ONE OF THE WALKS AT SUMMERS PLACE, BILLINGSHURST.

Special Gardens.

Another feature of the pleasure grounds consists of two special gardens between the hedges.

"One of these," said Mr. Best, "consists entirely of herbaceous borders, two hundred feet long, edged by tiles, over which grow Arabis, Aubrietia, and other rock plants. In the border itself, Delphiniums are prominent; also Heleniums, herbaceous Phlox, Tree Lupins, Solidagos, Doronicums, Hemerocallis, Oriental Papaver, Lychnis, and Asters. Between the Yew and Laurel hedge is the Rosery, approached through an archway of Dorothy Perkins, Hiawatha and Psyche, and Briers at either side."

"And your main beds?"

"There are seven, with eighteen trees of one variety in each. These varieties are Madame Ravary, General Jacqueminot, Caroline Testout, Mrs. W. J. Grant, Madame Hoste, Frau Karl Druschki, and Rainbow. The wall at the end is covered with Ramblers?"

Apples on Bushes.

"How large is your kitchen garden?" I asked, as we entered.

"There is an acre between walls and hedges, and about the same quantity outside for growing the rougher vegetables. We do not devote the inside kitchen garden entirely to fruit and vegetables, but make it as pretty as we can, with Roses on arches along the centre, while Pæonies are a great feature of the borders, which run all round. As to other flowers outside, we grow

Digitized by Google Original from CORNELL UNIVERSITY

Border Carnations in front of one of the houses. I layer them in August, pot them in October, keep them in one of the Vineries, and plant out in March."

"Do you grow Apples entirely on bushes?"

"Yes, and prune them severely in summer and winter. A few Pears are grown, such as Winter Nelis, and Williams's Bon Chretien, but the soil suits Apples much better. We get good crops of bush fruits and Morello Cherries. Of Black Currants we have Baldwin's Black, newly planted, and we are not troubled with the mite. From two or three plants of Loganberry we gather a quantity of fruit. Of Strawberries, only one variety, Royal Sovereign, is grown."

The Cultivation of Early Peas.

"What is your principal vegetable?"

"Decidedly Peas. I suppose the garden Pea is a favourite vegetable with almost everyone. On our very clayey soil, we often have a difficulty to get the ground in fit condition for sowing early Peas, but we like to do this in January. Sometimes we have sown them with frost on the ground, and obtained very good results, though we take care not to sow until there have been two or three mild days, the frost being only just sufficient to make the soil crumble and stop it sticking to one's boots. When the drills have been drawn out, we put in a mixture of soot and ashes. Before sowing the seeds they are sprinkled with water, and then covered with red-lead, to scare away mice. When the seeds have been covered in, I place a few more ashes on the top, which helps to keep the soil more open. A little more soot is sprinkled round the plants as soon as they appear, in order to keep away slugs. When the plants are about an inch high, we draw up some soil round them with a hoe, and then stake them as soon as possible. The pods should be gathered directly they are ready, so that any later pods may have a better chance to fill out."

Forcing Cauliflowers and Rhubarb.

"Do you care to say anything about other vegetables?"

"Between the Peas we grow a row of ordinary Spinach, and sometimes early Cauliflowers. The Spinach Beet is largely grown, and stands well. A certain quantity of Asparagus is forced in a frame, and we start cutting in beds the beginning of May, continuing until the middle of June. It is a mistake to cut later. We force a few Dwarf Beans in pots, using Sutton's Forcing for the purpose, and, for outside growth, Canadian Wonder. Only a few Potatoes are grown, the varieties being May Queen, Harbinger, Up-to-Date, and Superlative. Cauliflowers, brought on in boxes, are planted out in the middle of April."

"I see you force a quantity of Rhubarb outside?"

"We have been pulling it for three weeks. My system is to put pots on the plants after the frost comes, and straw round. But the pots should not be put on till the frost has done its work."

The Range of Glass.

"Then, there are the houses?"

"They include a Peach house, which is entirely cold, with an inside border. We get good crops of Bellegarde, Sea Eagle, Late Devonian, Dymond, Hale's Early and Waterloo. Here we keep in winter our Agapanthus, Hydrangeas, and Campanulas."

"How many Vineries are there?"

"Three. In the first we have Black Hamburgh (which are just set); and in the second, Muscats, Buckland's Sweetwater, and Black Hamburgh. This Vinery is also used for pot Roses for the conservatory, the favourite varieties being Liberty, Richmond, Lady Roberts, and Mrs. W. J. Grant. In the late Vinery, which is planted inside with the roots growing out, the varieties are Lady Downe's Seedling, and Black Alicante. Here are the Oleanders, which we stand in front of the house in June, and the Fuchsias, of which the varieties are Ballet Girl, Lieutenant Moriarty, Brilliant, and Royal Purple."

"Do you grow many Carnations?"

"In the cooler house we are now entering are Malmaisons and Perpetual-flowering varieties, of which we grow several up-to-date kinds."

How to Get a Good Display of Chrysanthemums in November.

Then, noticing in one of the houses Mr. Best's double Cyclamen, with a white and crimson centre, and a collection of Orchids in the stove, with a few Dracænas and Crotons, I enquired about the Chrysanthemums.

"They are a big feature with us, and we have a large group of the Japanese varieties in the conservatory. I endeavour to have a good display in November, and to secure this I like to start propagating at the beginning of the previous December. I always select the strongest cuttings because they make the best plants. Before they are put into pots, I invariably dip them in Abol, which prevents them from being attacked by mildew or fly whilst they are in the propagating cases. Using 3-in. pots, I fill them with a mixture of loam and leaf-mould, passed through a fine sieve, with plenty of coarse sand. When this has been firmly pressed into the pots, I place a sprinkling of sand on the top, and the pots are then ready for the cuttings. I put in twice as many of these as I require, so that I may have plenty from which to select the best plants. Four cuttings are inserted round the side of each pot, and they always root better like this than in the middle of the pot. They are next plunged in cocoanut fibre to the rims, in handlights placed in the late Vinery. If they are well watered in, they require little or no water until well rooted. I shade them from the sun, but admit a crack of air to let off excessive moisture. At no time should the cuttings be allowed to droop. On bright days, I spray over with a fine syringe, and find it very helpful."

SPRING FLOWERS AT SUMMERS PLACE.

Artificial Heat.

"What about artificial heat?"

"I only use it in frosty or very damp weather. As the cuttings become rooted, they are taken from the cases and gradually hardened to the sun and air. In about five or six weeks they make sufficient root to be potted up singly. Three-inch pots are again used, and I find a mixture of fine loam and leaf-mould, with a little sand and wood ashes, and a slight sprinkling of soot, very suitable for this potting. I only pot the best plants, and just the number required. Towards the end of March these plants are taken from the Vinery to a cold frame, the frame being well covered on frosty nights by mats. Careful attention is given every day to watering and airing, and as the weather becomes warmer, more air is admitted. The pots become full of roots about the middle of April, and the plants are then ready for another shift."

The Final Potting.

"What size pots do you use on this occasion?"

"Five and six-inch pots, and the soil is used in a coarser state, with a little artificial manure and sifted horse-droppings incorporated. To make the soil firm when potting, I use a rammer. The plants are still kept in the frame, but an abundance of air is admitted on all favourable occasions. Towards the end of April the lights are taken off in the day-time, and by the middle of May I am able to stand the plants outdoors altogether. By the second week in June they are ready for the final potting in 9-in. or 10-in. pots, when the compost used is a mixture of roughly chopped, loamy leaf-mould, horse droppings, wood ash, bones and soot. The soil having been made very firm, the plants are then stood in their summer quarters."

"Do you stake them at once?"

"Yes, it is the only safe plan. As the pots become full of roots, I water the plants with manure and soot-water, also giving them top-dressings of artificial manure about once a fortnight. To avoid any trouble with fly, it is only necessary to occasionally spray the plants with insecticide. A sharp look-out must also be kept for earwigs. I consider that the first week in October is a good time to house the plants, though if any of the buds show colour before this date, they are taken in at once. As the blooms open, a light shading becomes necessary if the sun is very bright. I never allow the flowers to touch one another, or to touch the stakes, because the contact bruises the petals. With a little more watering and ventilating, the result of one's labours will soon be seen."

"How long have you been at Summers Place, Mr. Best?"

"I came here early in March, 1908. With regard to my previous experience, I started under my father at The Vyne, Basingstoke, my father being gardener to the family by whom I am at present employed. I was then for three and a half years at Sandbeck Hall, Lord Scarborough's seat in Yorkshire, next at Deepdene, Dorking, for eighteen months, and then I went to the gardens of Lord Lansdowne, at Bowood, where I remained for two years in charge of the plant house."

ALFRED WILCOX.

MR. WILCOX's article for next week is entitled "Orchids for Amateurs," being an interview with Mr. Arthur Cross, of Achnacone Gardens, Braiswick, Colchester.

THE Asparagus is a genus of the Lily tribe. It is only found in a wild state on the south-western and western coasts, and in Wexford and Waterford, in Ireland.

THE finest form in cultivation of that charming plant, the Japanese Quince (Pyrus or Cydonia japonica), is that known as Simoni. It is not a new plant, but its exquisite colour should ensure it a place in every garden.

ONE of the most beautiful of all deciduous shrubs is the little-known Exochorda grandiflora; this is a near relative of the Spiræas, and by some is included with them, but, charming as many of the shrubby Spiræas are, none of them can equal this for sheer beauty. The large blossoms are of the purest white, with a central ring, or eye, that is quite unique. It is a perfectly hardy subject, and by no means expensive.

Digitized by Google Original from CORNELL UNIVERSITY

of receiving others for the purpose of dissection, the author has now made a careful examination of the insect. He described the forms of branchiæ in different genera of *Neuroptera*, and pointed out that the peculiarity of *Pteronarcys* consists in its possessing in its winged state, both branchiæ for aquatic respiration and spiracles for the direct respiration of air.

He then described the branchiæ, their connexion with the respiratory organs, and the mode in which the blood circulates through them, as he has seen in a neighbouring family, *Sialis*, and reviewed what is yet known of the habits of the insect in connexion with these remarkable structures.

The author regards *Pteronarcys*, from the circumstance of its possessing in its winged state the means of both aquatic and aërial respiration, as an *Insect Proteus*, the representative of the *Proteus* of *Vertebrata*, both in structure and habits.

The anatomy of some parts of the dermo-skeleton, of the spiracles, and of the distribution of its internal respiratory organs, as compared with that of neighbouring genera, is then described, as well as of the digestive organs, and nervous and reproductive system. These are minutely examined and the structures delineated on an accompanying plate.

Anniversary Meeting.

May 24.

The Lord Bishop of Norwich, President, in the Chair.

This day, the Anniversary of the birth of Linnæus, and that appointed by the Charter for the election of Council and Officers, the President opened the business of the Meeting, and stated the number of Members whom the Society had lost during the past year; and the Secretary read the following notices of those Fellows with whose decease the Society had become acquainted since the last Anniversary.

Mr. Arthur Biggs was for some time gardener to Isaac Swainson, Esq., and afterwards Curator of the Cambridge Botanic Garden. He was elected an Associate of the Linnean Society in 1815, soon after his appointment to the latter office; and in December of the same year he became a Fellow of the Society. While in the service of

Mr. Swainson he contributed to the first volume of the 'Transactions of the Horticultural Society,' a paper entitled "An Account of some new Apples which, with many others that have been cultivated, were exhibited before the Horticultural Society on the 2nd of December last [1806]." He died in the early part of the present year.

John Dunston, Esq., of Castle House, Sidbury, near Honiton, Devon, became a Fellow of the Society in 1818, and died on the 11th of August 1847, at the age of 68.

John Ellis, Esq., became a Fellow of the Society in 1797, and of the Royal Society in 1801.

William Finch, Esq., M.D., of Bellevue, near Salisbury, became a Fellow of the Society in 1837, and died on the 7th of January 1848.

George Townshend Fox, Esq., was a gentleman of property in the county of Durham, and warmly attached to the study of natural history, and especially of British ornithology. He published in 1827 a "Synopsis of the Newcastle Museum, late the Allan, formerly the Tunstall, or Wycliffe Museum: to which are prefixed Memoirs of Mr. Tunstall, the Founder, and of Mr. Allan, the late Proprietor, of the Collection, with occasional Remarks on the Species, by those Gentlemen and the Editor," Newcastle, 8vo. This volume is chiefly remarkable, in a natural-history point of view, for the notes on the capture of the rarer species of British birds, and on the distinctions of the more doubtful, which evince considerable research and knowledge of the subject. Mr. Fox was himself a large contributor to the museum he described, and in which he continued to take great interest up to the time of his death, in April of the present year. He became a Fellow of the Linnean Society in 1825.

The Rev. John Hailstone, M.A., F.R.S., F.G.S. &c., was born in the neighbourhood of London, in the year 1759, and at a very early age was placed under the care of a maternal uncle at York, and afterwards sent to Beverley School in the East Riding of that county. At the usual period he was entered at Catherine Hall, in the University of Cambridge; his talents, however, attracted the notice of his friends, and he removed by their advice to a larger place of competition and honour, Trinity College, where he took his degree of B.A. in 1782, and was the second Wrangler of his year, in company with Dr. Wood the late Master of St. John (who was Senior Wrangler), Dr. Raine (late Master of the Charter House), Professor Porson and many other distinguished men. He was soon afterwards elected Fellow of his College, and in 1788 became Woodwardian Professor of Geology in the University, which office he held until 1818, when he relinquished it and his Fellowship, upon

THE GARDENS OF THE ATTORNEY-GENERAL, AT FOXHILL, READING.

THE feature of the gardens of Sir Rufus Isaacs, K.C., M.P., the Attorney-General, is the splendid Rosery. But the whole of the pleasure grounds at Foxhill are interesting, and on the occasion of my visit at the end of April. Mr. Blackwell, F.R.H.S., the gardener, showed me, to begin with, the skilfully decorated conservatory adjoining the house. The scheme of decoration included a bank of Cinerarias, doubles mingling with singles, while upwards of a score of different shades of colour were represented, blue, pink, and mauve especially prevailing.

"As to the arrangement," said Mr. Blackwell, "there are four layers of pots tier above tier, and their occupants go on flowering for seven or eight weeks. Onposite to the Cinerarias is a collection of Primula obconica, and several tiers of Schizanthus, Wisetoniensis hybrids in baskets. They were small plants at the outset, but the experiment has answered expectations. Other baskets suspended from the roof are filled with Asparagus Sprengeri, and on the top of the roof itself are Roses and Cobea scandens variegata. At the end of the conservatory are two Tree Ferns."

"They are very handsome specimens. But you have not mentioned the standard Fuchsias, which make an effective background."

"We shall put most of them outside in June. Close to the steps is a collection of Clarkias, Salmon Queen and Firefly, from which we get a great show of colour."

"You have already a fine show of colour just outside the conservatory, with Kerria japonica a mass of golden blooms."

Kerria japonica for Table Decoration.

"Yes, I suppose that the tree has thousands of flowers on it. We use them for decorating the table, and cut some splendid sprays, the fine colour of the blooms being emphasised by the pretty green foliage. It was planted here five years ago."

"Is the small range of glass devoted to plants?"

"No; entirely to Grapes, Black Alicante in one Vinery, and Muscats in the other. On the shelf are Strawberries, which we commence picking the week before Easter. We manage to bring on a number of Ferns in the Vineries."

"How do you fill up the border in front of them when the spring flowers are over?"

"The present combination of Myosotis Royal Blue, Daffodils, and Giant White Daisies will be followed by one of Antirrhinums, Asters, and Stocks, with an edging of Alyssums. The Roses in beds here are Hybrid Perpetuals. The weeping standards are Flora, Waltham Beauty, Ruga, Dorothy Perkins, Elisa Robichon, Lady Gay, Souvenir de Pierre Notting, L'Ideal, and Grace Darling. As an edging, fibrous-rooted Begonias are used. In this warm corner the Roses flower in June. The soil is heavy loam, with a clay subsoil. For the pergola, the varieties, in addition to Lady Gay, are Debutante, Hiawatha, Madame Alfred Carriere, Blush Rambler, Crepuscule, William Allen Richardson, and Rubin. The border by the pergola, now filled with Polyantha grown from our own seed, will be replaced by annuals, such as Sweet Peas, Clarkias, Antirrhinums, Stocks, and Godetias, mostly pink in shade. The border of Sweet Peas is blue, Mrs. Heslington and Mrs. Charles Foster (navy-blue), and Flora Nora Spencer and Mrs. George Higginson predominating. The border in front of the conservatory is entirely blue. It is made up of the blue varieties of Sweet Peas, Delphiniums, Aconitums, Veronicas, Eryngiums, Lupins, Anchusas, Michaelmas Daisies, Nigellas, and Canterbury Bells, with an edging of double blue Lobelia, and small Campanulas. The Wistaria sinensis trailing over the conservatory reaches right up the house. Under the verandah are Hydrangeas in tubs, and on the pillars Honeysuckle and Clematis. The Wallflowers in the border are succeeded by Ivy-leaved Geraniums and Ageratums."

Flower Beds Facing South.

"What is the position of the flower beds shaded by that noble Beech tree?"

"They face south. The border near the house with Wallflowers, Daisies, and Forget-me-nots, will be filled in summer with Marguerites and Ivy-leaved Geraniums, Madame Crousse. Two of the beds with the sundial in the centre, with double Arabis, intermixed with

THE ROSE GARDEN AT FOXHILL, READING.

Digitized by Google Original from CORNELL UNIVERSITY

Tulip Cottage Maid, will have Heliotropes, edged with fibrous-rooted Begonia Princess Beatrice, and the two with Myosotis and Tulip Pottebakker, Zonal Geranium Mrs. Lawrence, edged with a double row of Begonia Fairy Queen. In all the beds there are dot plants of Fuchsia Mrs. Marshall. Pink and blue are the favourite colours of Lady Isaacs, who takes the keenest interest in her gardens."

"Before we discuss the herbaceous borders, you might mention the names of the creepers which adorn the house."

"Golden Euonymus, Magnolia grandiflora, Solanum jasminoides, and Ivy. There is no scheme of colour in either of the herbaceous borders, but one is backed by mixed Sweet Peas. The principal contents are Phlox, Irises, Pæonies, Heleniums, Harpaliums, Thalictrums, and Veronicas, with standards of Lilac, flowering Cherries and Peaches, edged with Pansies Lord Beaconsfield (blue), and Mrs. Sinkins Pinks. The other border, joining the park, is eighty yards long, with tripods of Roses, Dorothy Perkins, at intervals. In addition to some of the varieties already named, it contains Pyrethrums, Asters, Solidagos, Hollyhocks, Delphiniums, Liliums, Rudbeckias, Helianthus, Spiræas, Asphodelines, Sedums, Lychnis, Gypsophilas, Echinops, Hemerocallis, Alternantheras, Erigerons, Saxifrages, Aubrietias, Aquilegias, Monardas, Galegas, Geums, Veronicas, Poppies, Campanulas, Chrysanthemums, Heucheras, Gentians, Violas, Achilleas, and Crassulas, several, of course, not being herbaceous. Now we approach the Rosery, which was made under the direction of Lady Isaacs since Sir Rufus bought the property, six years ago."

"What is the extent of this lovely pleasaunce?"

"About an acre and a quarter. You will notice that it has a hedge of Penzance hybrid Sweet Briers all round, and that all the beds are edged with Violas, chiefly Maggie Mott, Kitty Bell, Mauve Queen, and a yellow and white seedling."

Sixty-seven Rose Beds.

"Can you give me an idea of the number of beds?"

"There are sixty-seven beds of dwarfs, occasional pillars, weepers, Roses on logs, Roses on posts, on rustic arches, and on pergolas. The weeping varieties consist of Lady Gay, Dorothy Perkins, Jersey Beauty, Flora, Waltham Rambler, Felicite Perpetue, Waltham Bride, Bennett's Seedling, Evergreen Gem, Dundee Rambler, Gardenia, Aglaia, Hiawatha, Bas le Duc, Rubens, The Farquhar, Sweetheart, and Elisa Robichon. Most of these are budded on Briers, five to six feet high; and the growths reach the ground in most cases when they are tied down."

"Some of these you have also, I see, on posts?"

"Yes, Hiawatha, Lady Gay, Dorothy Perkins, The Farquhar, Aglaia, and Rubens. The other varieties include, notably, Madame Hector Leuillot, which is doing exceptionally well, and grows eight feet high. Then there are Gruss an Teplitz, Bouquet d'Or, Alberic Barbier, Claire Jacquier, Climbing Caroline Testout, Climbing Captain Christy, Ard's Pillar, Mons. Deserg, Francois Crousse, Reine Olga de Wurtemberg, Climbing Cramoisie Superieure, Persian Yellow, Blush Rambler, Madame D'Arblay, Madame Jules Seigfried, Madame Berrad, Golden Queen, Madame Jules Gravereaux, Madame Boursin, J. B. Clark, W. A. Richardson, Crepuscule, and White Dorothy Perkins."

Beds of One Variety.

"I will not ask you to indicate the names of the Roses in the mixed beds, but I should like to have those which you consider it worth while to select for bedding of one variety?"

"The Hybrid Teas are Warrior, Lady Battersea, Killarney, Madame Ravary, La Tosca, Madame Abel Chatenay, Richmond, Liberty, General McArthur, Mons. Joseph Hill, Madame Pernet Ducher, Lady Ashdown, Jules Grolez, Papa Gontier, Betty, La France, Madame Leon Pain, Madame Edme Metz, Madame Melaine Soupert, Earl of Warwick, Gustave Regis, Caroline Testout, Countess Cairns, Konigin, Corola, Etoile de France,

MR. E. BLACKWELL.

Mrs. A. Byass, Pharisaer, Lord Bacon, and Gloire Lyonnaise. The Teas in beds by themselves are Madame G. Nabonnand, Morning Glow, Lady Hillingdon, Madame Antoine

ROSE—LADY GAY, AS A WEEPER.

Mari, General Schablikine, Anna Olivier, and Corallina. Then there are the Hybrid Perpetuals, Mrs. J. Laing, Captain Hayward, Ulrich Brunner, Alfred Colomb, Annie Wood, Dr. Andry, Earl of Dufferin, Hugh Watson, and Mrs. Sharman Crawford."

"Was any particular plan carried out in the construction of the Rosery?"

"To some extent, no doubt; but no hard and fast line was drawn. The object in view has always been to make the Rosery as beautiful as possible. The beds vary in shape and size, and all of them have been cut out of the grass. The varieties on the Rose Temple are Dorothy Perkins and Lady Gay, and round the centre Lavender has been interspersed. The climbers (W. A. Richardson)), pegged down, are also intermixed with Lavender, and the varieties in the centre on the rustic pillar are Gruss an Teplitz and Crimson Rambler. In one corner Wichuriana Roses are trained over old logs, with Rosa rugosa and Chinese Roses in the front, and Cherries planted outside as a border."

"What do you consider the average life of a Rose?"

"Five years. There is one variety, a Hybrid Tea, which thrives for six years; its name is rather appropriate, The Warrior. During the last three years a number of new varieties have been planted, and they are breaking well now Before the Roses are planted we trench the soil from two feet six inches to three feet deep."

Then, after strolling round the Rosery for some time, we passed through an arch of Rubens, into the spacious tennis-courts. Here, too, were Roses, especially a bed devoted to Madame Abel Chatenay, with a groundwork of white seedling Violas. Facing this is a bed of Rhododendron Pink Pearl, and a bed of R. Cynthia.

Specimen Trees.

"The aspect of the carriage entrance is north-west," said Mr. Blackwell, "and the front of the house is covered only with Ivy. From this point many of the specimen trees and shrubs are conspicuous. They include Abies pinsapo, the White Thorn, Cedrus atlantica glauca, Acacias, and Berberis stenophylla. The Roses close to the front door are mixed Hybrid Teas."

"You have some fine specimen trees on the other side of the house sloping down to the lake?"

"Particularly the Chestnuts and the Junipers. Three large clumps of Hybrid Rhododendrons merit notice; they have been in their present position for a number of years, and give a quantity of flowers. The three flower beds in this vicinity will be scarlet and white in the summer, the scarlet Paul Crampel, the popular Geranium, and Marguerites in the centre."

Retracing our steps, we proceeded through an avenue of fine trees, towards the stone lodge at the entrance to the grounds, and crossing the road, which is on high ground commanding an excellent view of Reading, we turned our attention to the picturesque little orchard adjoining the kitchen garden.

"Do you grow many varieties of Apples here?" I asked.

"Blenheim Orange, Cox's Orange Pippin, Fern Pippin, Rosemary Russet, Lord Suffield, Ribston Pippin, Pott's Seedling, and Wellington. In addition to the Apples, we grow in the Orchard the Brassica section of Vegetables, and a plantation of Raspberries, put in two years ago. There is a Nut walk opposite. The kitchen garden is three acres in extent, but only a portion of it is enclosed in walls. Fruit is the chief feature. Apples are grown on pyramids. In addition to the varieties in the orchard, we have Allington Pippin, Worcester Pearmain, Hawthornden, and Lane's Prince Albert. The Pears, also grown on pyramids, are chiefly Pitmaston Duchess, Winter Nelis, Doyenne du Comice, Beurre Diel, Catillac, and Uvedale St. Germain. The aspect of the kitchen garden is northerly, and consequently fruit and vegetables are rather late, but most of them do well."

"What about Peaches?"

"Planted on the south wall, they give excellent crops, the varieties being Crimson Galande, Belgarde, Amsden June, Rivers' Early York, Sterling Castle, Walburton Admiral, Sea Eagle, and Nectarine Pineapple. Plums and Apricots

Digitized by Google Original from CORNELL UNIVERSITY

are also grown on the same wall. In order to secure a late crop, Currants and Gooseberries are grown on a north wall, and in an ordinary season, we can pick them as late as September. For earlier purposes, they are grown under a cage."

"How long have you been cutting Asparagus?"

"We commenced on the first of April. There are three beds, four years old, and another much older. We have a special south border for early vegetables, where we pick Peas at the end of May; cut Cauliflowers and Beans about the same time; Spinach during May; and Lettuce in June. Potatoes are also dug in the middle of June."

"How long do you go on picking Peas?"

"Up to the end of September. The varieties are Fillbasket, Duke of Albany, Duke of York, Gladstone, and Centenary. There is one feature in the kitchen garden which I think is still rather unusual. We grow French Beans on poles and wires."

"What is the effect on your season?"

"We started cutting last year, the first week in July, and picked on an average, a bushel daily until the frost cut them down. They not only look better than the rows, resembling a nest of summerhouses, but the foliage on the wires shades the roots and increases the crops. I sow in pots and plant out the last week in May. The varieties are Prizewinner and A1."

"Do you grow many flowers in the kitchen garden?"

"Five rows of Sweet Peas, thirty yards long. I have to supply, not only Foxhill, but the house of Sir Rufus Isaacs in town, with flowers all through the season, and therefore a great number are needed. Under a north wall, Lilies of the Valley, which like a little shade, are coming on well. In frames, where we grow early Turnips, Carrots, and Potatoes on the French system, Violets are a feature. They are struck in boxes before we plant them out in the spring. But the principal feature of the frame ground is the collection of large flowering Japanese Chrysanthemums. All the glass we have is represented by the two Vineries."

"Have you done any showing, Mr. Blackwell?"

"Last July I won first prize at Reading Rose Show for twelve bunches of garden Roses or Ramblers. That is all the showing I have done at present. But I have only been head gardener here for three years. Before that time I was foreman for three years. My previous experience was gained at Holme Park, Sonning; Cavenham Park, Suffolk; and Sandhurst Lodge, where, under Mr. Townshend, I had charge of the houses."

ALFRED WILCOX.

THE gardens of Captain Wiener, at Ewell Castle, Surrey, will be described next week.

CLIMBING ROSES UNDER GLASS.

THE blooming of climbing Roses under glass is practically over, and those left are of small value now that the outdoor Roses are in bloom. A thorough pruning of the plants should therefore be done, so that good, strong shoots may be made for producing blooms next autumn and spring. Strong shoots are already breaking out in various places, and in most cases the whole of the old wood may be cut back to these breaks. This severe pruning is not only good for the Roses, but it is just what is wanted to let in light and sun to plants underneath, which would otherwise become drawn and useless for producing blooms.

Pruning Marechal Niel.

Some varieties of Roses require harder pruning than others. The good old Marechal Niel should be pruned hard back every spring after the blooming is over. I frequently take out six feet lengths of old rods as soon as a strong young shoot shows some sign of breaking. I like to see one of these starting before I cut so severely, and if there is no signs of one growing, I shorten the rods a few feet, and cut the sideshoots back rather close to the rod, which generally has the effect of causing some good breaks to which the rods may be further shortened. Such severe pruning will generally cause a few strong shoots to grow from ten to fifteen, or more, feet long. It is from these the finest blooms are produced the following spring; also these strong shoots will send out other strong shoots from near their base the following season after flowering, when they are cut back again.

Climbing Niphetos is another variety which is best cut hard back at this time. There is no difficulty in getting this to break into a number of strong growths—so much so that it is sometimes necessary to remove some of them to prevent overcrowding.

Climbing Perle des Jardins always produces young shoots plentifully when pruned hard back. This is a good climbing Rose for the greenhouse, having the deep golden-yellow colour of Marechal Niel, when the latter is at its best. It is a continuous bloomer. The first batch of blooms is over before Marechal Niel comes into bloom, and the second commences by the time the Marechals are over. It blooms again in the autumn, and sometimes continues into the winter.

WELL-GROWN AND BADLY-GROWN RADISHES.

Good Greenhouse Climbers.

Madame Pierre Cochet is another deep golden-yellow, which is as continuous in blooming as the preceding. It is a strong grower, and breaks freely. It is very sweetly scented.

Climbing Mrs. W. J. Grant is a wonderfully floriferous variety under glass. It requires hard pruning now, or it will continue blooming, and become stunted in growth. The blooms are a nice shade of pink, a colour which is scarce in good, indoor climbers. The buds come a nice shape for buttonholes and general cutting purposes.

Belle Lyonnaise is a pale yellow, of good shape, and sweetly scented. It is very free and continuous blooming. I have had many of the autumn blooms continue into the winter, when they are much appreciated.

Molly Sharman Crawford is not considered a climber, but it climbs enough for most greenhouses. It is a very fine Rose under glass, large, on stiff stems, coming pure white, and is a free and continuous bloomer. The hard pruning at the present time prevents the continuous blooming during the summer, and less pruning must be practised if blooms are required during the summer months.

Striking Cuttings.

Cuttings may be put in from the prunings, if these are required to produce Roses for future planting. Shoots which have produced blooms are the best, and these should be cut off close to the stems with a slight piece of the old stem on the heel. These may be put in the soil on the north side of a wall or building, burying the whole of the shoot except the top bud and leaf. The soil must be kept quite moist. They will strike more quickly if put in the same depth in pots, inserting about six around the inside of a 6-in. pot, in soil composed of half sand. The pots should be put into a frame, which should be kept quite close and shaded with a mat, and the cuttings should be sprinkled every morning.

This is a good time to plant Roses in the greenhouse, but these should always be first grown in pots. They can still be obtained from most Rose growers.

ROSEUM.

RADISHES

RADISHES figure in collections of salads at shows, but they are very extensively grown by amateur gardeners for home use.

After the early part of June cultivators very often find it rather troublesome to grow tender roots. Now, there is no better place than a border on the north side of a low wall after the very hot weather sets in, and especially in the case of light, sandy soils. But even the best soils will not avail much if strawy manure, or any foreign matter, be dug into it wholesale. The soil must be rich, but it should be made so by the addition of well-rotted manure, broken up thoroughly, and mixed with the soil.

How to Get Good Roots.

Fig. 1 shows how clean and straight the growth of a Radish root is in properly-prepared ground; and Fig. 2 how worthless roots are, when grown in badly-prepared soil. When in contact with lumps of soil, bits of wood, or even fresh straws, the roots begin to fork, and the crown is soon lifted above the surface. Furthermore, the best-shaped roots generally possess the smallest tops, and the ill-shaped ones the largest leaves.

The prepared ground should be quite eighteen inches deep, then there will be ample moisture below. Sift the soil if exhibiting be the chief object in view.

DELAMERE.

GARDEN LIFE "PARLIAMENT."

ALTHOUGH time has proved that the benefits derived from artificial manuring are real and permanent, there are many who still regard it as a vain illusion or agreeable theory. With the object of convincing these, we invite readers to contribute brief, pertinent accounts of their experiences and practice in the matter of the application of artificial fertilisers, and the results obtained thereby. We shall style the discussion:

ARTIFICIAL MANURES IN THE GARDEN: ADVANTAGES AND RESULTS DERIVED FROM THEIR USE.

To the writer of the most interesting letter published each week, we will send a Postal Order for 5s., and to the writer of the second best a Postal Order for 2s. 6d. Letters must be written only on one side of the paper.

All communications should be marked "Parliament," and be addressed to the Editor of GARDEN LIFE, Hatton House, Great Queen Street, London, W.C.

Digitized by Google Original from CORNELL UNIVERSITY

tion by artificial cultures is a fraud is equally wrong. No amount of inoculation or anything else will make up for an imperfectly-prepared seed-bed, bad season, and poor cultivation." What, then, is left? Merely that inoculation, like any good artificial fertiliser, may be some small help to a cultivator who knows his business. Evidently, then, we are still very far from the horticultural millenium which we were led to expect we were entering on. The time when we can sit down and watch our crops grow bountifully, year after year, has not yet arrived, after all. We must still dig and weed and hoe, still manure the ground, still raise our crops with the sweat of our brow (my present assistant will surely groan when I tell him the sad mistake that has been made); but if we do these things properly, inoculation may, in some cases, be of some slight service to us. That is all. It is just another fall for Humpty-Dumpty. The fellow has no business to be getting on walls.

The Scarborough Lily.

October 25th.—The Scarborough Lily (Vallota purpurea) is frequently described as a window plant, and certainly it may often be seen grown to perfection in the windows of cottages. A native of South Africa, it needs protection from frost in winter, and it gets in such positions just the baking in the sunshine which suits it while it is growing. These plants, again, when grown in windows, are not often repotted, and this is also favourable to Vallotas, for they flower much better when they are left undisturbed as long as possible.

H. C. DAVIDSON.

The Gardens at The Heights, Witley, Surrey.

INTERVIEW WITH MR. JAMES BINNINGTON.

IT would not be easy to find eight acres of land turned to better account for horticultural purposes than they are at The Heights, Witley. This charming country residence was the property of Colonel Lord Edward Pelham-Clinton until his lamented death, in the summer of this year. It now belongs to his niece, Mrs. Farnham, to whose courtesy I am indebted for the visit which I paid to the gardens on August 31st. The house itself is worthy of its beautiful setting; the exterior is extremely attractive, and the interior has recently been greatly improved. The improvements were only, in fact, completed just before Lord Edward's death, though Mrs. Farnham has the satisfaction of knowing that her uncle was pleased with the manner in which they were carried out. She was good enough to point out to me some of the additions, which have been made with much care and taste, and I had the privilege of seeing some of the very fine paintings which adorn the walls. From the windows of almost every room there is a magnificent prospect. As the name implies, the house stands on an eminence, and the outlook includes some of the most delightful Surrey and Sussex scenery.

An interesting episode in the history of The Heights is that from 1876 to 1880 it was the home of George Eliot, and the famous novelist, like the present owner, must have intensely appreciated the natural charms of the diversified landscape. With these charms, the grounds harmonise in the most remarkable manner, and from the terrace, at the top of the slope, to the kitchen garden, at the bottom, everything is in the most perfect order.

"And, first of all," I said to Mr. James Binnington, the head gardener, as he commenced to show me round, "will you tell me how long it is since the gardens were laid out?"

"About forty-six years. They were designed by Sir Joseph Paxton, and, though many alterations in detail have been made, during the progress of years, pains have always been taken to preserve the main features."

"In what order do you suggest we should take the features?"

THE HEIGHTS, WITLEY, SURREY.

"Perhaps I should explain at the beginning that while we grow an ample supply of fruit and vegetables, the main object always kept in view is to have an adequate supply of plants to decorate the interior of the house and beautify the pleasure grounds."

MR. JAMES BINNINGTON.

"Yes, I observed that there were many beautiful flowers in the house, and the general appearance of the pleasure grounds proves that you are able to fulfil your main purpose."

"As we are speaking of flowers, then, we might deal with the bedding on the terrace, as it is made up at present. For instance, here is a bed of single striped Petunias, edged with Stachys lanata, grown for its silver-grey foliage, which affords an excellent contrast in colour."

"Begonias appear to be a favourite?"

"Yes, there are several beds of fibrous-rooted Begonias, single and double, the edging alternating with either Alternantheras, Mesembryanthemums, or Echeverias. In the two stone vases are planted Ivy-leaf Geranium (Mauve Beauty), with Ageratums underneath. Another bed consists of yellow Lantana and dwarf blue Ageratum, with a centre plant of Abutilon."

"Then there are the four round beds, and two large ones in close proximity?"

"The former are made up of Ageratums, with Iresine, edged with Pyrethrums, and the latter of Iresine (the tall-growing), with Madame Crousse Geraniums, and dwarf Iresine edged with Stachys lanata. Several other beds consist of pink Begonias, with Mesembryanthemum cordifolium (variegated), edged with Alternanthera. Two beds are composed chiefly of Heliotropes (Lord Roberts) nearly a foot across, with Abutilons as dot plants, edged with Alternanthera. I find, by the way, that the Heliotropes do better planted out than in pots."

Cannas and Geraniums.

"I see you have also a large bed of Cannas?"

"Yes, the soil here suits Cannas remarkably well. The Geraniums mixed with the Cannas are Souvenir de Charles Turner, and the edging Geraniums Flower of Spring. In another corner, with a long border edged with Stachys

lanata, and dwarf Iresines, are more Cannas, mixed. Yet another bed consists of Geraniums (White Vesuvius), with Acacias as dot plants, edged with blue Lobelias."

"How do you fill all these beds in spring?"

"Almost entirely with Wallflowers, of which we raise between three and four thousand. The varieties include Cloth of Gold, Eastern Queen, Purple Queen, Fairy Queen, Blood-red, Ellen Willmott, and dwarf bedders, brown and yellow."

"I notice that you have Geraniums growing among the shrubs."

"They are scarlet and pink varieties, in baskets, and are placed there in summer for the sake of colour. In the spring we have Rhododendrons in flower."

"You go in considerably for Rhododendrons?"

"Our collection includes some of the best and rarest varieties, such as Pink Pearl (of which we have four beds), George Hardy, Ingramii, roseum elegans, perspicuum, Duchess of Bedford, Mrs. J. Waterer, and Princess Mary of Cambridge. These are for the beds. Then, as standards, we have Mrs. John Waterer, Mrs. Mendel, The Warrior, Sappho, Alexander, The Queen, and roseum elegans. We put peat in the soil of the beds only."

A Picturesque Spot in the Garden.

Combinations near the House.

"Perhaps we might now take the immediate surroundings of the house."

"Under the windows in front are Plumbagos, Campanulas (blue and white), and Hydrangeas, all in pots. When they have done flowering, we fill the pots with other varieties. Facing the front door, and backed by trees and shrubs, is a border of mixed flowers, Nicotiana, Tagetes, Nasturtiums, Petunias, and Ageratums being prominent, while one little corner is entirely devoted to Nicotianas of various colours, which are much valued, also, for indoor decorations. On the house itself, Ampelopsis Veitchii is the principal feature, with Myrtles underneath. The kitchen entrance is enriched with a wealth of Laurels, and we think that Irish Ivy on wire makes a better screen for the stable yard than a wall."

"You ought to say a word about the garden round your own pretty cottage."

"The blue and white Campanulas have been a great feature, growing seven feet high; when we were talking about spring bedding, I should have said that the bank of the terrace, which now is bright with St. John's Wort, is in spring planted with Daffodils. In fact, thousands of Daffodils are planted out, as well as a large number of Crocuses. But, before we go down the slope, I should like you to observe the plantation of Scotch and other Pines, among which have been introduced a few Oaks, Spanish Chestnuts, Limes, Beeches and Robinias. The shelter afforded to the house and garden by these trees is appreciated in hot weather."

A Corner of the Pleasure Grounds at the Heights, Witley.

Notable Conifers.

"Which do you consider the most notable of the numerous specimen Conifers which stand by themselves on the lawn?"

"They include Abies pungens glauca, A. pinsapo, A. Douglassii, Cedrus deodara, Retinospora plumosa, Wellingtonia gigantea, Cupressus Lawsoniana erecta viridis, Juniperus chinensis aurea, Pinus cembra, Cryptomeria japonica, Thujopsis borealis, Cupressus Lawsoniana, C. L. monumentalis glauca, C. L. erecta viridis, C. L. gracilis, Pinus macrocarpa, Abies excelsa, and Taxus Dorastonii aurea."

We next came to a Heather garden, containing a great number of varieties of Ericas, admirably arranged. Here, and in several parts of the pleasure grounds, I was impressed with the complete manner in which the principle of ornamentation has been carried out. For example, there are not only handsome carved stone seats and tables in particular places, but at various points are oak and other rustic chairs, comfortable and artistic. Further, are beds of Golden Privet and Golden Yew, and a very pleasing effect is created by Clematis montana, planted on the stem of a Scotch Pine, with Ivy round, and a bed of white Petunias below. More striking still was a pyramid planted entirely with West Brighton Gem Geraniums, which last from the end of May till the frost sets in.

"Geraniums," said Mr. Binnington, "are followed in spring by double white Arabis, which, I think, forms even a more effective pyramid than the Geraniums."

Then, having admired the croquet lawn, with its display of fine old lead vases, containing Geraniums (chiefly pink), and the excellent arrangement of shrubs, I asked whether the ground suited Bamboos.

"We have only lately formed that plantation," rejoined Mr. Binnington, "but, so far, they have done very well; the soil and shade suit them, and in about three years' time I hope they will look very well indeed."

"You might tell me the names of the varieties."

"The Arundinarias are aristata, falcata, Hindsii, anceps, insignis, nepalense, japonica and nitida; the Bambusa, fastuosa, Marmorea, palmata, quadrangularis, and tesselata; and the Phyllostachys, aurea, Castellonis, flexuosa, henonis, nigra, Quilloi, and viridi-glaucescens."

From the tennis court we proceeded under several Rose arches, into the kitchen garden, which is approached by two winding walks,

skirting the woods on both sides, and is quite hidden from the pleasure grounds. The kitchen garden, however, is distinctly attractive. The central walk, a hundred and fifty yards long, is also the central feature. There are numerous arches of Roses (Queen Alexandra, Crimson, and other Ramblers), Loniceras and Clematis, and the wide herbaceous border on either side of the walk is planted with great judgment in the matter of colouring.

"As a matter of fact," said Mr. Binnington, "we go in for wealth of colour in this border, from the tall Sunflowers (growing twelve feet high), and the Cactus Dahlias, to the Nasturtium border. Another contrast in colour is supplied by the Snapdragon (Sutton's new carmine-pink), planted against silver and gold Holly hedges."

"The Sweet Peas deserve a special paragraph to themselves."

"They are grown in rows, according to colour. We used to have a hundred varieties, but I selected the best twenty, and now confine myself to these. They include such popular varieties as Miss Willmott, Dorothy Eckford, King Edward VII., Lady Grisel Hamilton, Helen Pierce, Black Knight, and Navy Blue."

"How many varieties of Violets do you grow?"

"Four—Marie Louise, Mrs. J. J. Astor, Neapolitan, and double white. Border Carnations are grown in quantity for cutting, namely, Old Clove, Duchess of Fife, Pride of Penshurst, Raby Castle, and Rennie Payne."

"Do you go in for any other section of Carnations?"

"Yes, the Trees, for pots, in winter. Then we plant the best of them out in May, and thus get a quantity of flowers, lasting from the end of August until the cold weather sets in. The best varieties are Enchantress, Fair Maid, Lady Bountiful, Mrs. Thomas W. Lawson, Mrs. M. A. Patten, Floriana, G. H. Crane, The Belle, and Royalty. Altogether, we have about five hundred of these."

The Glasshouses.

"How many houses are there?"

"Six. In the first we grow, as you see, Melons and Cucumbers together. The varieties of Melons are Hero of Lockinge, Carter's Blenheim Orange, and Earl's Favourite; the Cucumbers, Carter's Improved Telegraph, Lockie's Perfection, and Rochford's Market. In the second house, Sunrise and Outdoor Tomatoes are grown, with Gloire de Lorraine Begonias, in pots, hanging on the nails."

"You have a fine specimen of Allamanda on the roof of your stove."

"It has been there for three or four years, and lasts in flower nearly all the year. The stove plants include Crotons, Acalyphas, Asparagus, Bougainvilleas, Pancratiums, Pandanus, Dracænas of sorts, Caladiums, Eucharis, Gardenias, and Hibiscus."

"And the greenhouse, in which I observe Fuchsias are a conspicuous feature?"

"There are several varieties, and also several of Geraniums, Ivy-leaved Geraniums, Begonias and Coleus. The other plants are, chiefly, Heliotropes, Achimenes, Acacias, Aspidistras, Grevilleas, Kalanchoes, Plumbagos, and Gloxinias. In the Fernery are Palms and Ferns in variety. The Vinery, which completes the list, contains Black Hamburgh, Foster's Seedling, Madresfield Court, and Muscat of Alexandria."

Fruit and Vegetables.

"Have you any specialities in the way of hardy fruit?"

"Pears on cordons do very well with us, notably Beurré Hardy, Beurré Jean van Gwert, Alexandre Lambre, Bon Chrétien, Charles Ernest, Colmar d'Ete, Conference, Dr. Jules Guyot, Doyenné du Comice, Durondeau, Emile d'Heyst, Fondante d'Automne, Jargonelle, Louise Bonne of Jersey, Olivier de Serres, Pitmaston Duchess, and Princess. Our best Apples are Blenheim Orange, Cellini Pippin, Dumelow's Seedling, King of Pippins, Warner's King, Lord Suffield, Ribston Pippin, Mère de Menage, Beauty of Kent, Scarlet Custard, Bramley's Seedling, and Irish Peach."

"What about vegetables?"

"Most vegetables succeed in this garden, because the soil is very light, and is composed mainly of sandy peat. But, of course, it has been necessary to use a quantity of manure. We go in largely for salads, and you may like to mention specially Raphanus caudatus, or the Rat-tailed Radish. This used to be grown largely many years ago, and I think might with advantage be revived. These Radishes are planted in a row, and supported with sticks, like Peas. They are very useful for salads all through the summer, when it is difficult to get other Radishes."

"Have you been at The Heights ever since Lord Edward Pelham-Clinton bought the place?"

"I came here five years before Lord Edward's time. I was previously for three years head gardener at Brome Hall, Suffolk, and my earlier experience was gained at Claremont, four years; Millburn House, Esher, three years, under Mr. Gardiner (who has just been appointed superintendent of Hyde Park); and Dalton Hall, Yorkshire."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 273.—PLANTS FOR EARLY FLOWERING.

Dear Kate.—One of the special charms of gardening is this—that it shortens the winter, for, directly the frosts cut off our summer flowers, we set to work to provide bright blossoms for spring, and there is no time in the year when we cannot have plenty of flowers, if we do this. The earliest bulbs (Roman Hyacinths, etc.) are already showing waxen buds; the Poinsettias are unfurling their carmine bracts; the fire-coloured blooms of Libonia floribunda are opening; and the Chrysanthemums are in full beauty, especially in the cold glass porch, where they always last longer and grow more sturdily than in the warm conservatory. But these are autumn flowers, and we must now think of spring.

Deutzia Gracilis.

Deutzias and Spiræas.

Of course, you have plenty of the snowy-white Deutzia (gracilis) which is so easily induced to blossom early? There is now a new pink variety of this graceful plant, Deutzia gracilis carminea, with deep red buds opening to show pale pink petals inside. It is very bright and cheerful looking, and can be grown as easily as the white Deutzias, if you pot up the roots now, let them stand in a sheltered place out of doors until the end of the year, and then bring them into slight warmth, and give them plenty of tepid water. Then there is a new pink Spiræa, called Peach Blossom, which is like the white Japanese Spiræa in habit, but produces erect plumes of pink flowers instead of white; and another variety, Queen Alexandra, is more spreading in shape, with very pale pink blossoms, in fact, they are almost white when forced for early bloom, but deeper in tint when grown in a cool place. All the Spiræas need an abundant supply of water, and the herbaceous varieties, especially, are best treated as semi-aquatic plants; out of doors they enjoy a bog, or a bog-tub in a dry garden, and indoors they should have saucers which can be kept half full of water, for the least check to their growth, when they have once started, is likely to be injurious to them.

Both these shrubs are quite hardy, and yet force well; the Spiræas should be planted out after flowering, choosing a damp spot in the garden for them, and if you divide a large clump into several pieces before doing this, you will have plenty of plants to pot up in the autumn. But if the clump has been much forced, it is better to let the pieces grow undisturbed in the garden for eighteen months or more, taking them in when November comes round the second time after they are divided and planted out.

BINKS Alan of 44 Greycote Shortstown **Bedfordshire** died 14 April 1941 at 3 Kimbolton-road Bedford Administration **Birmingham** 24 July to Mary Ella Binks (wife of John Henry Binks). Effects £123 14s. 9d.

BINNS Alfred George of 36 The Triangle Altrincham **Cheshire** died 1 February 1941 Probate **Manchester** 19 March to Jeanette Binns widow. Effects £801 0s. 11d.

Gardener's Chronicle, 1894

Obituary.

MR. HENRY BIRCH.—We regret to announce the death of this widely-known and highly esteemed gardener, who died suddenly of apoplexy, on his return from Northampton to Castle Ashby, on Tuesday, November 27. The deceased, who was forty years of age, began his gardening career with his father at Hatherop Castle, subsequently being placed in the gardens at Sandringham. He filled the situation of foreman in the gardens at Croxteth Park, was head-gardener at Waddesdon, Aylesbury, and for the past eleven years has held the head place in the gardens of the Marquis of Northampton at Castle Ashby, Northamptonshire. A widow and two children survive him.

phate of copper in winter, but the remedy is one which should be applied with caution if there are other plants in the bed. Indeed, if they are evergreen, it would almost certainly injure them. Spraying in spring with a solution of sulphide of potassium (half an ounce to the gallon of water, with the addition of some adhesive, such as a little soft soap) is much safer.

Seed Germination.

August 14th.—What proportion of seed out of a packet should germinate? Of course, much depends on the kind of seed and the conditions. But, generally speaking, a good sample, gathered, sorted, and sown under favourable conditions, should yield 80 per cent. of plants. In some American experiments, which extended over thirteen years, it was found that over 89 per cent. of Onion seed germinated. When the seed was two years old, however, the percentage fell to 79; at three years to 57; and at four years to 10. These figures were affected by weather and climate. They were lower in a cold, wet summer than in a dry, warm one, and they were higher in California than in Connecticut. Even for a single plant, it is impossible to lay down a hard-and-fast rule, while the figures which generally hold for one kind cannot be safely applied to any other. The period required for germination is equally variable. Some seeds germinate in a few days, while others, like those of many Palms, often take several years. With regard to Palms, however, a French grower has found that, by treating the seeds like those of Cannas—soaking them for twenty-four hours in very hot water—they will germinate in a fortnight. If this is true, it should make Palms even cheaper than they are at present.

H. C. DAVIDSON.

The Gardens of Boldre Grange, Lymington.

INTERVIEW WITH MR. W. S. BLACK.

IN all the New Forest there is no fairer spot than Boldre, and the pleasure grounds of Boldre Grange are lovely beyond description. Mrs. John Lane Shrubb, the owner, to whose courtesy I am indebted for a visit paid to the gardens early in July, is herself an enthusiastic horticulturist, and revels in the beauty of all kinds of flowers. Arriving on a perfect summer morning, Mr. Black, the head gardener, first of all showed me some of the attractive surroundings. These are characteristic of New Forest scenery at its best. The feature of the principal drive is a fine show of Rhododendrons on either side, but there is another drive, from the pretty house occupied by Mr. Black, through picturesque woods, fragrant with the perfume of Pines. Near the Grange are several specimen trees, all the more notable because they were all planted when the place was laid out but thirty years ago.

"The soil must be very congenial?" I observed.

"Yes," rejoined Mr. Black, "it is a light, gravelly soil, and everything grows quickly. One of the best specimens here is the Sciadopitys, and the Tulip-tree and Wellingtonias do

A WALK AT BOLDRE GRANGE, LYMINGTON.

particularly well. The soil suits the Elæagnus, of which we have numerous varieties. The only bedding at this point consists of Digitalis, which is nearly over, and will be succeeded by Hyacinthus candicans."

Proceeding to the south front, from which a charming view of the sea and the Isle of Wight is obtained, we entered the spacious and lofty conservatory. I at once noticed a remarkable

BOLDRE GRANGE, LYMINGTON.

specimen of Cyathea, and a Palm bed is quite a feature. Out of this bed several trees with stems a foot in diameter have been taken. Noticing, also, a Camellia bed, I asked the names of the numerous climbers.

"They include Asparagus in variety, africanus being one, Bignonia Tweediana, Bougainvillea glabra, Jasminum grandiflora, Lapagerias alba and rosea, Plumbago capensis and capensis alba, Solanum Wendlandii, Streptosolen Jamesonii (in flower), Bomarea Carderi (a splendid climber, with bell-shaped, rose-coloured flowers), Pleroma sarmentosum (a fine variety, with violet-purple flowers, very free flowering and effective), Tecoma jasminioides (white, streaked red in throat), Acacia dealbata, and Hoya carnosa."

"The flowering plants vary, of course, according to the seasons, and now, I see, you have some Francoas in bloom. Do you give them special treatment?"

"No, merely the ordinary greenhouse treatment. There are two rather nice specimens of Crassula in flower, and the Tracheliums (cœrulea) are very useful because of their colour."

"When did your fine collection of Gladioli begin to flower?"

"The middle of June, and they will last for about three weeks longer. The varieties are Blushing Bride, Prince of Orange, Ne Plus Ultra, Peach Blossom, Rosy Gem, and The Bride."

"Which do you consider the best of the Pelargoniums in bloom?"

"Miss Jessie Cottie, Mars, Godfrey's Pride, Eucharis, Richmond, and Hamlet et Ophelia. Four of the best Ivy-leaved Geraniums are Ryecroft Surprise, Baden Powell, Ryecroft Scarlet, and Galilee; and six of the best Zonals are Countess of Jersey, Mary Pelton, Mrs. Ewing,

THE PERGOLA AT BOLDRE GRANGE.

Queen of Italy, Fragrance, and Lady Tennyson. Of Verbenas, we think Miss Willmott the best for colour."

"What is the name of the pretty golden flower?"

"Tritonia aurea. We treat it the same as a Gladiolus. The Malmaison Carnations in flower include Princess of Wales, Prince Consort, and Nell Gwynne."

"And the yellow variety?"

"Duchess Consuelo. But that Carnation is more of a Tree than a Malmaison. It is very difficult to get a yellow variety good. The conservatory also contains a number of Japanese Maples, Eulalia japonica variegata (a splendid dwarf plant), and Clerodendron Balfouriana (scarlet and white), in pots."

"There are several climbers on the Grange?"

"Chiefly Banksian Roses, Magnolias in variety, Jasminum revoluta, Myrtles (angustifolia and Communis), Habrothamnus, Mandevillea suaveolens (pure white, scented), and Pomegranate (Punica granatum). By the way, in front of the conservatory is a rather rare evergreen climber, Lardizabala biternata, with racemes of purple flowers and glossy green leaves."

"Then, there are the tubs on the terrace."

"They are filled with Hydrangeas, American Aloes, and Agapanthus umbellata, mainly. The last thrives wonderfully here."

"Do you give it protection in the winter?"

"Only a little, in a cool house. The mild climate and dry air suit the Agapanthus. This applies also to the Yuccas, and still more to the Chamærops Fortuneii."

The Italian Design.

"You go in for Begonias for bedding purposes?"

"There are four beds, two of Heliotrope, and two of Salpiglossis. The straight borders fronting the Grange have, for a first line, Salvia splendens and Bethelii, Calceolarias amplexicaule, and Ricinus; the second line is composed of Geraniums Hermione and John Gibbons alternating; and the third line of double blue Lobelias."

"But the formal bedding faces east, with two lofty specimens of Dracæna australis at the top."

"Yes, that is an Italian design, with a terra-

cotta bed in the centre, consisting of Lobelia cardinalis, Ivy-leaf Geraniums Charles Turner and Little Pet, and Coleus Verschaffeldtii. The remainder of the design is made up of Fairy Queen Begonias, Geraniums La France, Flower of Spring, Henry Jacoby, Hermione, Mrs. Pollock, and Harry Hieover, golden and brown Calceolarias, and dwarf Heliotropes, edged with Lobelias and Diascia, the whole enclosed by Box."

Beyond the bedding on the east side of the Grange is a unique summer-house, with a weeping Elm for a roof, and Laurels on the sides of the corrugated iron. Even when the thermometer, as at the time of my visit, showed ninety in the shade, the summer-house was quite cool. Near it was a Palm tree twenty feet high, just coming into flower, to which no protection whatever is given in winter; and, beyond, on the sloping lawn, are Maples in variety, Cedars, Prunus Pissardi, and Tamarix gallica. Passing the lovely tennis court, surrounded with trees and shrubs, we arrived at one of the most striking pergolas I have seen.

The Decoration of the Pergola.

"How long ago was this highly-decorated archway erected?" I enquired.

"Six years ago. It runs the entire length of the south side of the pleasure garden, has brick and metal pillars alternately, with trellis-work on the top. A little of the brickwork is visible here and there, and the whole has a splendid effect. My experience is that the plants grow as well on brick as on wood, and, in fact, you can judge for yourself."

"Roses are largely represented?"

"Considerably, but there are many other plants intermixed. The Roses are the principal of the newest climbers, notably the Macartney section, and the Wichuriana, such as Réné André. Ampelopsis is represented by Veitchii and hederaceà, Clematis by paniculata and many other varieties, and other climbers in evidence are Aristolochia, Azara microphylla, Berberidopsis corallina, Buddleia variabilis, Ceanothus Gloire de Versailles, Hydrangea scandens, Lathyrus latifolia, Magnolia stellata, Pyracantha Lælandii, Solanum jasminioides, Vitis in variety, and Wistarias. Under the south brick wall, against which the climbers are planted, is a border filled up by a collection of herbaceous plants chosen for colour, in front of these being a wall fifteen inches high."

"I should like to know the names of some of the varieties you consider the most striking."

"Cephalaria alpinus, Galega alba, Antirrhinum, Anchusa (Dropmore variety), Lilium candidum, Alstrœmerias, Campanulas, Geraniums Endresi, and Potentilla Congo (quite new, a pink flower). These are now in flower."

"How is your Yew hedge walk planted?"

"On either side there are Nicotiana in variety, Salvias in variety, Lobelia cardinalis, Abutilons, Maize, Begonia Reading Beauty, edged with variegated Alyssums and Begonia semperflorens. Near the Palm at the end of the walk is a bed of hybrid Calceolarias, edged by Pyrethrums. The hill leading to the kitchen garden is chiefly noticeable for the Eucalyptus tree and Acacias, the border consisting of Sweet Williams, Antirrhinums, and Canterbury Bells. Here, also, are the Sweet Peas, in clumps of one variety, sown in December."

"When did you plant them out?"

"The last week in April, and they flowered the first week in June. The varieties are Henry Eckford, Dorothy Eckford, Miss Willmott, Lady Grisel Hamilton, Gorgeous, and Coccinea. The breadth of Border Carnations consists of Cecilia, Primrose League, Gardenia, Viscountess Melville, Crombie's Pink, and Raby Castle, the most prolific of them all. We find the bed of Pentstemons Chelone (the pink form) most useful for cut flowers. Before we go into the kitchen garden, we might look into the glasshouses at the end. They consist of four parts."

"I see that you have borders to the Vineries both inside and out."

"Yes, I like to have both. In some respects, it saves work, and it certainly gives the late Vines a better chance. The Grapes grown here, which are brought on for cutting in August and September, are Madresfield Court, Duke of Buccleuch, Black Hamburgh, Gros Maroc, and Muscat Hamburgh."

"You have an extraordinary specimen of an Aloe in these Vineries."

"It is so enormous that it cannot be lifted out. I think you would like to mention the quite rare plant, in a tub, with a splendid flower, light lavender striped. It is Mackaya Bella, and has just finished blooming. In this house is also a batch of double-crested Begonias, Phenomené, which come in for August. The varieties of Peaches in the other houses are Rivers' Early, Nectarine Peach, Dymond, Goshawk, Royal George, and Crimson Galande, which latter is about the best. The Nectarines are Chaucer, Humboldt, Lord Napier, and Spencer."

The Newest Dahlias.

"The herbaceous borders are quite a feature of your kitchen garden?"

MR. W. S. BLACK.

"Half the herbaceous borders here were replanted last year, and a considerable number of plants added to the collection. Before we replanted, soil to the depth of nine inches was taken out, and replaced by good loam. The varieties now in flower are chiefly Alstrœmerias chilense and lutea, Delphiniums in variety, Dianthus in variety, Gypsophila, Hemerocallis, Heuchera sanguinea, Kniphofia ruta, Onopordon bracteatum (the Giant Silver Thistle), and Ostrowskia magnifica. Pinks are also planted in these borders, the best six varieties being Richard III., Monarch, Ernest Ladhams, His Majesty, Mrs. Sinkins, and Dauntless. Dahlias also do well, and are largely used for cut flowers. The most noteworthy varieties are Pink Pearl, Mabel Tulloch, Effective, Victor, Septor, and Lincoln. These are all new."

"What about Roses?"

"The Rose border was specially made two years ago. Owing to the natural soil being stony, as well as light, a quantity of heavy loam was added, as well as stable manure. The result is that the Roses thrive and flower splendidly. As to varieties, I consider that Frau Karl Druschki, Maman Cochet, Muriel Grahame, Madame Jules Gravereaux, The Bride, and Boadicea are about the best.

"How many Chrysanthemums do you grow?"

"About four hundred, in pots—Japanese, singles, Spidery, and a few Anemone-flowered. We have a hundred plants for large bloom, but the most useful are the decorative varieties, which are disbudded. For cut flowers the singles and Spidery are valued, but the Japanese last longer for the conservatory. We cut some nice flowers from these in March."

"Which do you recommend for large blooms?"

"F. S. Vallis, Reginald Vallis, Mr. W. Knox, W. A. Etherington, Mrs. George Mileham, and Mrs. J. Dunn. The six best Decorative varieties are Beau de Lawson, Golden La Triomphante, Madame A. Nonin, Madame P. Radaelli, Madame R. Oberthur, and R. H. Pearson. The best singles are Earlswood Beauty, Eureka, Edith Pagram, Felix, Miss Irene Cragg, and Ladysmith. Of the Spidery varieties, I prefer Cannell's Favourite, King of the Plumes, Mrs. James Carter, Mr. Filkins, Sam Casswell, and Mayflower."

"You seem to have some very good crops of hardy fruit."

"Strawberries, which are all protected by netting, were very early. We picked the first dish of Royal Sovereign on June 8th. The only other variety grown is Noble. Black Currants and other small fruits are a good crop, but the fruit is small, owing to lack of moisture. Considering the Raspberries (Superlative) were only planted two years ago, they are very satisfactory."

"Are you satisfied with your Apple crop?"

"It is fair. Apples are grown as standards and espaliers, and the varieties which have given us the best results this year are Beauty of Bath, Bismarck, Cox's Orange Pippin, Duchess of Oldenburgh, and Irish Peach. Pears on the walls have done very well, indeed, but the crop on some of the standard trees is poor. Clapp's Favourite, Jargonelle, Pitmaston Duchess, Princess, and Souvenir du Congres are the pick of them. The crop of Plums and Cherries is only fair, and I expect they have felt the strain of an over-abundant crop last year. Peaches are doing tolerably well on the walls. Waterloo is a good early variety, and Yellow Eagle comes in very late."

The Vegetable Crops.

"Is the soil congenial to vegetables?"

"No, vegetables are very difficult to grow, and it takes time and labour to obtain anything like satisfactory results. Peas and Beans have to be mulched, and this year they have been watered and syringed twice weekly. They have, however, repaid the time spent on them."

"When did you begin to pick Peas?"

"The second week in June, and unless the frost interferes we go on till November. We begin to plant about the middle of July for late crops. The varieties following in succession are Little Marvel, Early Giant, Early Sunrise, Congress, Maincrop, Prolific, Eureka, Telegraph, Ne Plus Ultra, and Latest of All. Cabbages and Cauliflowers do best when treated with a liberal supply of stable manure between the rows after they have been earthed up."

"Do you sow Onions twice?"

"In addition to sowing in spring and autumn, I plant a few specially in boxes, in order to secure size. The varieties are Ailsa Craig, James's Keeping, and Reading. Both Onions and Carrots do exceedingly well, and do not need any extra care."

The Plant Houses.

"You have some more houses at this end of the kitchen garden?"

"One is devoted entirely to Peaches and Nectarines, and contains some very fine trees, the varieties of Peaches being Sea Eagle, Magdala, and Gladstone; the Nectarines, Lord Napier and Darwin. There are two Vineries, one containing Muscats only, and the other Lady Downe's Seedling and Alicante. The Cannas in one of the Vineries are being kept back for August; the varieties are Cannell's Newest, W.

Watson, Gladiator, Auguste Chantir, J. B. Vanderschol, Linary, and others.

"We have a big batch of Begonias—Gloire de Lorraine and Turnford Hall—in the stove, which we shall bring on in October. In the intermediate house there are some nice Orchids, including Dendrobiums, Cymbidiums, and Cypripediums, also a batch of seedling Coleus, a collection of Bilbergias (the flowers being of many colours), Anthuriums, and Phyllocactus. Cucumbers, Melons and French Beans are grown in the frames outside. Then there are Violets, the varieties now in their summer quarters being Marie Louise, Mrs. J. J. Astor, Lady Hume Campbell, Duke of Parma, and Compte de Brazza. These start flowering about the beginning of October, and supply us with bloom until the end of March. I ought to add that we are extremely well off for water; a pump, driven by a hot-air engine, furnishes us with the needful supply."

"I presume, Mr. Black, that you are a native of Scotland?"

"Yes, I was born in Aberdeenshire thirty-six years ago. I served my apprenticeship at Haddo House, and then went to Broxmouth Park and Gosford House, both in East Lothian. I was next general foreman at Scone Palace, Perth, my first appointment as head gardener being at Hendersyde Park, Kelso. I was there for nearly four years, and I came here in November, 1904."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 316.—GREENHOUSE FERNS.

Dear Kate,—Many conservatories are not as beautiful as they might be, if the plants were well arranged, and also set off with some of the beautiful foliage plants of which I wrote to you last week. But, besides these, plenty of Ferns in pots will be needed to show flowers to the best advantage, and without these the shelves are apt to look bare. The early autumn is an excellent time in which to remedy this state of things, and start a number of young Ferns, as they are then sold (as seedlings) very cheaply, and they soon grow to a useful size.

The Giant Fern, Woodwardia Radicans.

First Favourites.

Adiantums (Maidenhairs) are always first favourites, and, although they are not amongst the easiest of Ferns to manage in a sitting-room, they usually do well in the moist air of a greenhouse, especially if they are not placed in a sharp draught. Adiantum fragrantissimum (which ought to be fragrant, but isn't) is the finest of the greenhouse Maidenhairs, with large and handsome fronds. Then there is the finely-cut Adiantum gracillimum, like delicate lace in appearance, which is very pretty and distinct; A. grandiceps, with tassellated fronds; A. Mariesi, A. decorum, and A. Williamsi, all good varieties (the last of which is slightly golden beneath its fronds); A. tinctora and A. fulvum, with pink fronds when unfurled; A. Pacotti, with doubly-pinnated fronds (making it look something like Parsley), and A. formosum, a very handsome Fern, quite unlike the rest. If you have a warm Fernery, with a minimum temperature of sixty degrees, you may add the beautiful Adiantum Farleyense, growing to the height of two feet, and the fringed fronds of A. macrophyllum bipinnatum, with many another rare and lovely Maidenhair; but even in a cool greenhouse, from which the frost is only just excluded in winter, you can grow the Canadian Maidenhair, A. pedatum, and our native A. capillus veneris, still found occasionally in the south of Devon and Cornwall, usually in inaccessible caves near the sea, for every scrap of it which is within reach of the collector is sure to be confiscated. There are about a dozen varieties of this Fern, however, which are equally hardy, the one called A. imbricatum being one of the prettiest, though A. elegantissimum is larger in growth.

For All Purposes.

The best group of Ferns, both in the house and the greenhouse, is that of the Pterises, many of which are hardy enough to survive a little frost, if kept fairly dry in winter, when they are nearly dormant. From New Zealand we have P. tremula, an elegant plant, which seeds itself all over the floor of a moist greenhouse, and appears in the pots of other things sometimes. Then there is the Ribbon Fern, P. serrulata, with its crested varieties of various kinds, so often seen in a room; and the silvery-centred fronds of P. cretica albo-lineata are also easily grown, P. sempervirens, with fine evergreen fronds, being an excellent variety, too, but without the white lines. P. argyrea is very handsome, with large, silver-banded fronds, but not quite so hardy as the above-mentioned, as it comes from India and other parts of the East Indies; and the loveliest of all the Pterises, P. tricolor, with crimson, silver, and green fronds, is only to be managed in a hothouse, for it looks miserable, and soon dies, without plenty of moist warmth. P. Victoriæ is a new variety, also variegated; but it is as delicate as P. tricolor, or nearly so.

Lomaria Gibba is a Tree Fern from New Caledonia, and its two varieties, crispa and tincta, are also most distinct and handsome. These Ferns are very subject to an attack of thrips, if kept in a room or any dry atmosphere; they enjoy moist warmth when starting into fresh growth, but will grow in a greenhouse if syringed often. Lomaria l'Herminieri is a tiny Tree Fern from Florida, very pretty, for a glass case, where L. Gibba does well, but soon grows too large for its quarters; and there are others, such as L. Banksi, which are also miniature Tree Ferns.

One of the most useful of greenhouse Ferns for cutting (Onychium japonicum) comes from Japan, and has finely-cut fronds, which are shining, and they quite glitter in artificial light. They also last far better than the fronds of the Maidenhairs when cut, and give a very light appearance to a bouquet. Amongst the Aspleniums, two of the most desirable are A. viviparum and A. bulbiferum, both of which produce innumerable tiny plants on drooping their fertile fronds, whilst the rest (being unfertile) stand upright above them. They are good room Ferns, growing to a large size if well tended, and they are almost hardy. You can propagate them very easily by means of pinning down one of their fronds covered with plantlets into a box of compost (peat, leaf-mould, and loam in equal quantities, with some charcoal in small lumps intermixed, will suit nearly all Ferns), and the little plants will grow roots quickly, if you keep them moist.

An Evergreen Fern.

A most beautiful greenhouse Fern (or for a room without gas) is Osmunda palustris, a bog Fern, which must always stand in a saucer of water, for any one of its lovely crimson-tinted fronds which once droops will never recover itself. It is a so-called flowering Fern, which grows to the height of two feet, and is evergreen. The large Osmundas (Claytonia and cinnamonea), as well as our British Osmunda regalis, are hardy enough for a cool Fernery, and so is O. gracilis, which we grow in a bog-tub in the garden. All are decidedly handsome in the summer, but, as the three last are deciduous, they die down completely in the winter.

The climbing Ferns, Lygodium scandens and L. japonicum, are very elegant; they clothe the greenhouse walls on strings or wire netting. There is much confusion between the two, the latter being often sold as L. scandens, which it certainly might be called with truth, as "scandens," of course, means climbing; but the deciduous one, with very light foliage, is L. japonicum, and it is not quite hardy, whilst L. scandens is evergreen—a more robust and taller-growing plant altogether; and L. palmatum, from North America, is almost hardy, except where exposed to severe frost. These beautiful climbing Ferns should be in every greenhouse, but they are usually conspicuous by their absence, unfortunately. Nothing can be more perfect than their long sprays for table decoration, and we ought to grow plenty of them. L. japonicum looks well if trained over a wire balloon, and can be used in the autumn for room decoration, cutting down all the dead

deformans. There is yet an earlier cause—a severe check, such as drought, or, worse still, a keen east wind. It is this that gives the fungus its chance. "The under surface of the leaves," says Dr. Cooke, "in the hollows of the blisters, assumes a hoary or frosted appearance, and when examined under the microscope is found to consist of a number of cylindrical cells formed of a transparent membrane closely packed together side by side, each cell, or ascus, containing the elliptical sporidea in the same manner as in the Pear-blister and the Plum-pocket. This disease is sometimes called the curl, from the curling and distortion of the leaves." It is infectious, and, unfortunately, there seems to be no remedy beyond the removal of the infected parts. "Diseased or fallen leaves should be burned. Branches bearing infected leaves should be pruned back beyond the point of infection. The disease is rampant if the leaves receive a sudden check from fall of temperature. Activity of the disease has been checked by a sudden increase of temperature." Bordeaux mixture, which has proved effective against Pear-leaf blister, a very similar disease, cannot be safely used for Peach trees, because their foliage is much more delicate. Plum-pocket, to which Dr. Cooke alludes in the passage just quoted, is caused by a closely allied fungus, which produces wrinkled blisters on the fruit itself. Here, again, there is nothing to be done but remove the affected fruit as soon as possible—it is bound to drop in any case—and to destroy any parts likely to contain the mycelium.

March 25th.—There is no lack of water this spring. Two years ago, when sinking a well, no trace of moisture could be discovered for a considerable depth; now the water seems to be close to the surface. Raspberries ought to do well, and I doubt whether the usual mulch will be necessary. A mulch helps to keep the moisture in the ground, which is often an advantage, but at the same time it also keeps the heat out, and that may be a more than counter-balancing disadvantage. Rule of thumb won't work in the garden; rule of head is better.

H. C. Davidson.

(To be continued.)

Famous Gardeners at Home.

No. 130.—Mr. W. M. Blackwood, at the Gardens, Hethersett, Reigate.

There is one feature about the gardens at Hethersett which is very unusual. They were planned and laid out forty-five years ago, under the auspices of the late Mr. Baxter, who also built the beautiful mansion and resided in it till he died, in 1894. Mr. Baxter not only exceedingly disliked anything in the shape of formality, but he would not have any arbitrary division between pleasure grounds and kitchen gardens. The result is a mixture by no means wanting in charm, and has certainly not been attended by any cultural disadvantages.

Hethersett, Reigate.

"But," said Mr. Blackwood, the present head gardener, as we strolled towards the glasshouses, on the afternoon of my visit in the second week in March, "although in the main the gardens, which are between seven and eight acres, are kept up in the same way as they were when Mr. Baxter owned the property, several important additions have been made. A wing has been built on to the mansion, and four houses have been erected."

"Who bought the place when Mr. Baxter died?"

"Mr. D. C. Apperly. He built the comfortable lodge in which I live, and the bothy was added the first summer I came. Mr. Apperly also finished the north kitchen garden."

"Did you come here from the South of England?"

"No, from the North. I was born at Highcross, Benwell, Northumberland, my father being head gardener there at that time. I first started work in the gardens at Ferndene, Gateshead-on-Tyne, in 1882. I served at Ferndene for three years and a-half, principally in the glasshouses. Subsequently, after gaining experience in several gardens in Northumberland and Durham, I became head gardener to Lord Decies, at Bolam Hall, Northumberland, in 1894, leaving that post when the estate was sold to come here. In 1903 Mr. Apperly sold this place to my present employer, Mr. J. Auerbach, who takes much interest in the gardens, and likes to have everything grown as well as we can do it."

"How many glasshouses, pits, and frames do you run now?" I asked, as we entered the Cucumber house.

"Eleven. With regard to Cucumbers, we begin to cut in March, and keep up a supply until the following Christmas. The only variety

Mr. W. M. Blackwood.

grown is Sutton's Every Day, and I find it the best. It is a nice size for the table, a good setter, and a good doer. We have, in addition to this house, a pit of six lights in the summer for Cucumbers; a great quantity are used for salads."

"What varieties do you grow in the Melon house?"

"In summer we grow Melons in three houses. The first batch was planted the first week in March. The varieties are Royal Sovereign and Hero of Lockinge. Last year we tried the French Melon, Canteloupe, and shall try a few plants again this summer. The fruit is large, very juicy, and of good flavour. Last year also we had a few of the Eastnor Castle variety, which is very good, but I prefer Hero of Lockinge to any other."

"I see that you have some Tree Carnations in your mixed house?"

"Yes, about a hundred. On the other side are about a hundred Geraniums, including some seventy varieties of the best kinds. Here, too, we grow about seventy plants of Cyclamen, chiefly Sutton's Prize. For next year the two leading sorts will be the Giant White and the Cherry Red. We grow Tomatoes in this house in summer."

"What varieties?"

"Only one, Sutton's Perfection. The year before I came here I showed this Tomato in the North at seven shows, and won the first prize at every show."

"How do you manage to do so well with it?"

"My system is to sow the seed in January. As soon as the plants are large enough, we put them into small pots, and, when ready, transfer them into 5-in. or 6-in. pots. When they are nicely rooted we put them into 10-in. pots. It takes about sixty pots to fill the house."

"Perhaps you would tell me about the compost?"

"The plants are potted in about two parts of loam, half a part of rotten manure, half a part of lime rubbish, half of leaf-soil, and a good sprinkling of bonemeal. We add the soil about twice or thrice, as the plants require, during the season. After we have obtained a good set, we feed with cow-manure liquid about twice a week, never allowing the plants to get dry. Watering is a vital point with Tomatoes; in dry weather they should be watered twice a day. In the early part of the season we generally set the flowers with a camel's-hair brush, but later on we simply tap the trellis-work."

"So far," continued Mr. Blackwood, "I have been speaking of the main Tomato crop, but our earliest Tomato, usually cut in April, is Winter Beauty, which we also grow for a late batch. Perfection, if sown in January, is cut at the beginning of May, and we cut from the same plants until October. Each plant of the main crop grows about nine feet high, and we fruit the whole of the plants right to the top. It is quite an ordinary thing to cut three or four fruits, weighing about half a pound each, off one bunch of Perfection. There is another Melon house in which two crops are grown during the summer."

"What do you grow underneath them?"

"Caladiums and various other decorative plants. On the shelves we have about forty pots of Calanthes."

Entering another span-roofed house, I inquired if it was devoted to Carnations.

"Entirely," rejoined Mr. Blackwood. "Carnations are special favourites. We grow about four hundred in pots, as well as several hundreds out of doors. We commenced cutting Tree Carnations in November, and have been cutting every week since. We have also cut several Malmaisons during the same period, and, being much larger and finer than the Trees, they are more appreciated."

"How do you treat the Tree Carnations?"

"We strike them in January, in sixty degrees of heat. They are then potted off into 3-in. pots, and gradually hardened off until they are put into cold frames in May. They are potted into 6-in. pots, when ready, and pinched generally twice. The lights are entirely removed in fine weather. They are put into the house again in August or September, and grown in fifty degrees of heat during the winter. As soon as the pots are nicely filled with roots they require to be fed twice or thrice a week until the flowers begin to open. Then they should only have soot-water and clear water alternately. We disbud all the Carnations in order to get long stems and finer flowers. They require to be neatly staked and tied. We find that thin green Bamboos and the green raffia look very neat."

"And Malmaisons?"

"They are layered, when ready, generally in August. We layer them in frames, in loam, sand, leaf-soil, and a little peat. As soon as they are nicely rooted they are potted into 4-in. and 5-in. pots—some will hardly go into the larger size—then stood in frames and shaded for a few days, gradually receiving more light and air. They are housed in September or October, giving all the air possible in favourable weather. In December or January they are potted into 6-in. or 7-in. pots, their flowering-pots. A few keep blooming, but the best show is in May and June. We cut several last season six inches across the blooms. The potting-soil consists of two parts of loam, one part of peat, half a part of sand, and half a part of rotten manure, with sprinklings of soot, lime rubbish, and Ichthemic guano. The first potting-soil is not made so rich as this last. We also pot some of the one-year-old plants into 9-in. or 10-in. pots, and grow eight and ten flowers from each."

"Which do you consider the best of the Malmaisons?"

"Princess of Wales. The next best are King Oscar, Horace Hutchinson, Robert Burns, Valetta, Mrs. Trelawny, Mrs. Martin Smith, Calypso, Albion, Lady Grimston, Mrs. Everard Wood, Lord Rosebery, Prime Minister, Sir Evelyn Wood, Churchwarden, and Trumpeter."

"You have a fine variety of Crotons in the Croton house."

"We grow them on the one-stem system, suitable for table plants, and in this house various other table plants, such as Dracænas, Cocos, Pandanus, and several varieties of Begonia are grown."

"How many trees are there in the Peach house?"

"Six of Peaches and Nectarines. The varieties of Peaches are Noblesse and Bellegarde; and of Nectarines, Elruge, Rivers' Orange, and Lord Napier."

"They look well set and very promising for the season."

"The Bellegarde tree was only planted as a maiden tree three years ago last February, and last year we gathered a hundred and twenty Peaches from it. This year we ought to gather Peaches in July, just after Strawberries are over. The collection of plants in the Peach house is miscellaneous, Azaleas being a feature."

"How many varieties are there?"

"Thirteen. Some of the best are Hinodegiri, Madame Harman, Leidal, Madame van Cruyssen, Madame Louise van Houtte, Deutsche Perle, Vervaeneana, and Madame José Vervaene. The other varieties, all very good, are Dr. Moore, Bernard André alba, Madame Van van Langenhove, Empress of India, Simon Mardner, Emperor of Brazil. In this house are also a number of Pelargoniums, several Japanese trees, Hydrangeas (chiefly of the Dr. Hogg variety), and from thirty to forty pot Roses, Hybrids and Teas."

"When did you plant the Vinery?"

"Three years ago. The second year after the planting-canes were put in we fruited them. In 1902 we had three bunches from every Vine, and last year five. The varieties are Muscat of Alexandria, Madresfield Court, Buckland Sweetwater, Alicante, Lady Downe's, and Black Hamburgh. Considering the time they have been planted, they are, I think, showing well for this season. In this house we grow early Tomatoes, and Royal Sovereign Strawberries, and we bring in such things as Gloxinias, Maidenhair Ferns, and Streptocarpus."

"Do you have many pots of Streptocarpus?"

"Forty. It blooms all through the summer. We have a good variety of colours. As to the growth, it can either be raised from seed or the plant can be divided. If Streptocarpus is grown from plants it should be grown in about sixty degrees of heat. This should be continued until the flowers are expanding, and they should then be taken into a cooler house. There the plants stand and bloom, but they should be fed twice a week to keep the bloom continuous. I use cow manure liquid chiefly, and in the potting compost a sprinkling of Thompson's manure. I find them useful for cutting, as well as for decorative purposes."

"You have some Orchids in the Fernery?"

"The front stage is devoted to Odontoglossums, of which there are about a hundred plants. There are also a few Cymbidiums and Disas, which we bought last year. They look very well now, but they are rather difficult to grow. In the stove we have a number of Cattleyas and Cypripediums in flower—Sedenii candidulum. In this house there are two of the best varieties of Anthuriums—Andreanum and Scherzerianum."

In the flowering house the first thing that claimed attention was a grand show of Callas, the feature being the extraordinary strength of the plants.

"What number do you pot?" I inquired.

"About forty. Calla Æthiopica is the chief variety, though we have a dozen of the yellow also, which bloom in May. The latter needs much more heat than the white."

"I suppose you do not plant the Callas out?"

"Never. After the plants have been rested a little in the pots, they are potted up in September in a mixture of good loam, rotten manure, lime-rubbish, leaf-soil, a good sprinkling of bonemeal, and some of Thompson's manure. Then, if the season be wet, they should be stood indoors, but if it be fine they are better out. They should be carefully watered until the pots are well filled with roots. After they begin to bloom we begin to feed chiefly with cow-manure water—my mainstay. We feed twice a week, and give, for a change, a little of Thompson's manure or Clay's fertiliser."

"When do you begin to cut Callas?"

"In December, and keep on until June, almost without cessation. In the same house are more Azaleas, Primula obconica, Freesias, Narcissi, and Cinerarias of both the large-flowering and stellata varieties, the latter being more light and graceful for cutting. The Orange tree here has nearly a score of Oranges on it."

"Now we come to the pits."

"There are ten lights of bedding Geraniums, and Chrysanthemums are just being potted into 5-in. pots. We grow about four hundred of the Japanese and Incurved varieties, mostly

A Stand of Miscellaneous Plants, Shown at Reigate, 1903.

Japanese. Violets are largely grown. The double varieties are Marie Louise and Mrs. J. J. Astor. The latter is the new purple Violet, and a very free bloomer. Our singles are Princess of Wales and La France. We have had a quantity of Violets all through the winter. One frame contains Potatoes, another Lettuces, and a third various vegetables and bedding plants."

"I conclude that you go in considerably for bedding?"

"Yes; for instance, in one of the beds on the sloping banks in front of the mansion there are six hundred Tulips of various sorts. They make a great show when they are in flower. The south border is composed of Wallflowers, the Blood-red and the Yellow, edged with Forget-me-nots and Polyanthus. The "S" beds are full of blue and white Hyacinths, and those of the centres contain red Hyacinths; for the groundwork, Myosotis, which flower underneath, is very effective."

"Do you go in for bedding Begonias?"

"Very largely. We have a house full in the summer. Also I forgot to mention that we grow winter-flowering Begonias largely, both Gloire de Lorraine and Gloire de Sceaux. Reverting to the outside, there are herbaceous borders in two or three parts of the garden, and we have several hundred of very good varieties of Roses. On the front lawn there are four beds shaped according to the four suits of cards—the heart-bed, the spade-bed, the club-bed, and the diamond-bed—and various beds of standards. In one bed only the varieties are mixed; all the others are planted with one particular Rose."

"Then you have a pretty Rose border?"

"Yes, that looks very charming when it is covered with Roses. There are more Roses in the kitchen garden in front of the house. We have all the best varieties."

"I greatly admire the Yew hedge which surrounds the bowling green."

"It is said to be one of the finest in the county, and was planted when the gardens were made. In addition to the bowling green we have large tennis and croquet lawns."

"What do you put, for the summer, in the terrace border close to the mansion?"

"Sub-tropical plants; and we also fill the verandah in front with flowering plants."

"Shrubs and trees are not a great feature, I gather?"

"We have only a few flowering shrubs, but there are plenty of evergreens, and last winter we planted a bed of Rhododendrons and Azalea mollis. There are a few nice Cedars, and a good specimen of Wellingtonia on the lawn."

"You have an orchard as well as kitchen gardens?"

"Two orchards. These are quite independent of the gardens, and contain a varied assortment of Apples, Pears, Plums, Medlars, Quinces, and Nuts. The kitchen gardens are cropped largely both for fruit and vegetables. I may mention that Sweet Peas (like Roses and Carnations) are special favourites at Hethersett, and that we grow all the best named varieties in the front kitchen garden."

"How long has the continuous arch, planted with single cordons, been put up?"

"It is quite new, but we hope that it will be of practical value, as well as ornamental, in the future. There are eighty-four Pear trees, planted two feet apart, in the archway, with the intention of each tree coming right over to the opposite side. The varieties include Beurré Bosc, B. Alexander Lucas, B. de Jonghe, B. Easter, B. Fouqueray, B. Mortillet, B. Superfin, Charles Ernest, Conference, Doyenné d'Alencon, Doyenné du Comice, Durondeau, Emile d'Heyst, Fondante de Thierot, Jargonelle, Glou Morceau, Louise Bonne of Jersey, Marguerite Marrillat, Marie Benoist, Michaelmas Nelis, Nouvelle Fulvie, Pitmaston Duchess, and Triomphe de Vienne. We have a dozen trees each of Doyenné du Comice and Pitmaston Duchess."

"Does your wall fruit include Apricots?"

"A few. Peaches, Victoria Plums, and Morello Cherries also grow on the wall. At the back of the mansion there are Raspberries, Gooseberries, and Red, White, and Black Currants. By the way, we grow about forty plants of the Cape Gooseberry in the front kitchen garden. They reach five feet in height, and are delicious when the fruit is stewed. We plant them between the Potatoes."

"How many persons are employed in the gardens?"

"Six, four of whom live in the bothy."

"Finally, as to showing. Have you any time for it at Hethersett?"

"I only exhibit at Reigate. Last year I took, at the summer show, six firsts, four seconds, and one third. At the Chrysanthemum Show, in November, I took five firsts, five seconds, and two thirds. The year before I came South I won ninety-five prizes at seven shows in Northumberland. That was my record. I have shown Chrysanthemums, Orchids, specimen and table plants, fruit, flowers, and vegetables. It is absolutely necessary in these days to be an all-round gardener."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 87.—SPRING FLOWERS, THE LAWN, AND ASPARAGUS.

DEAR KATE,—At last it is dry enough to work in the garden, and we have been busy putting in (and removing, where necessary) fresh plants for the herbaceous border. This work might have been done a month ago, if the fates had been propitious, but what can we do when it snows and hails every day, as it did during the first half of March?

Pyrethrums, of which we have many first-rate varieties, can only be put in safely during the early spring, for those planted later than September (in the autumn) are very apt to "slope off" during a cold, wet season, and never reappear. We are now propagating them, by taking off small pieces (with roots, if possible) from the side of the clump, and potting each of these in a 4-in. pot, after which they are placed in the greenhouse (or a frame) until they are in full growth, when they can be planted out, but must never be allowed to suffer for want of water during the first summer. After that they will take care of themselves, only needing a little fresh soil over their roots each year in March. It is not desirable to raise the whole clump in taking these offsets, because it will put the whole plant back for the season, but we fill the holes made around it with rich soil.

AQUILEGIAS.

Agnes Mary Kelway is the name of a lovely Pyrethrum in rich pink, and James Kelway is almost scarlet in tint; Mary Anderson is one of the first to blossom, in pale blush-pink; Lorna Doone is deep rich maroon; Queen of the Whites is distinguished by its white cushion in the centre (instead of yellow), and is very valuable as a cut flower. Decoy is a lovely carmine Daisy, of perfect shape; and Apollyon, in bright pink, blooms all the autumn, in a most obliging way, for many of them only flower in spring. But if you wish for plenty of exquisite blossoms for table decoration in May, before flowers are plentiful, put in some of these lovely Marguerites without loss of time. Another favourite flower of mine for cutting is the Aquilegia, especially those varieties which have long spurs, for they are so light in effect, and almost like Orchids, though much easier to arrange, as they have nice long stems. Some years ago I procured some good seed of the best varieties (mixed), and ever since I have been delighted with the beauty of the hybrids raised from the original plants. One of the loveliest is in pale pink, with a creamy-white centre. Most of the flowers (except a few in pure white) have two distinct tints, contrasting, yet harmonising, such as violet and apricot, terra-cotta and yellow, primrose and cowslip-yellow, blue and cream-colour, etc., and it is quite exciting when a new batch of seedlings open their first flowers. We "rogue" them at once, pulling up all those which fail to show long spurs, and especially those in a dull purple, which always have small, close flowers, instead of the broad, elegant petals in the photograph I send you; their foliage is so pretty, too, almost like Fern, and these plants will do well in a city even, for they are asleep under the ground all the winter, and only start into life in March, when the worst of the fogs are over. If you have not a good stock of Aquilegias, you should get some seed of a first-rate strain at once, and sow it in a well-drained box of fine soil, which can stand in a greenhouse, or in a frame, until the little plants are well up, after which they should be hardened off gradually, and planted out in their flowering quarters in September. They will soon, however, disappear for the winter, and if there is a danger of their being "tidied" away when the borders are done up in the spring, it is better to prick them out into rather deeper boxes, when large enough, and keep them in a cold frame through their first winter, planting them out in the spring, just as they appear above the soil. Or you may sow the seed in the kitchen garden in May, but if we should have a dry summer many of the tiny plants will die, for they need to be kept moist in their first stages.

The lawn looks as though there had been snow again, for we have had it top-dressed with lime to destroy the moss which has sprung up these last few months between the grass. The late sunless, wet season has made this a common trouble, I believe, but if not removed the moss will increase and kill the grass in time.

The lime, which we obtained unslaked, was slaked before using it, and mixed with fine, rich, sifted soil, in the proportion of one part to two or three, then spread thinly over the mossy parts of the lawn. The effect looks disastrous for a few weeks, but after that the grass grows with increased vigour, and the moss dies, so that it is worth while to go through the ugly stage of top-dressing to ensure a good sward for the summer.

In February and March we were busy sprinkling lawn-sand (or waste salt) on the Daisies, etc., which are sure to appear every spring; this can be done all through the summer, if necessary, but spring is the best time, as

Oxford Dictionary of National Biography

Blaikie, Thomas (1751–1838), *landscape gardener and plant collector*
by Suki Urquhart
© **Oxford University Press 2004–14** All rights reserved

Blaikie, Thomas (1751–1838), landscape gardener and plant collector, was born at Corstorphine Hill, Edinburgh, on 2 March 1751, the youngest in the family of two sons and two daughters of Thomas Blaikie, who owned a small market garden at Corstorphine, and his wife, Janet Fiddes (*b*. 1719). He grew up in a strong Presbyterian household of plain living where the whole family shared in the work of the market garden. A variety of sources indicate that he attended the parish school at Corstorphine (Taylor, 8–9), where he would have studied Latin, writing, arithmetic, and English (his native tongue was Scots and his fluent French was reported to be heavily accented and peppered with Scots words right up until his death). His love of nature was nurtured at Corstorphine, and he wrote later in his diaries that nature was the key to creating a beautiful garden. His familiarity with the Linnaean system of nomenclature, as well as those of Haller and Jacquin, points to the likelihood that he studied at the Royal Botanic Garden, Edinburgh, under John Hope, who promoted the careers of many young Scottish gardeners.

Blaikie's plant collecting tour of Switzerland in 1775, which established his reputation, was financed by two of Hope's correspondents, the distinguished amateur botanists William Pitcairn and John Fothergill, while Joseph Banks laid out his duties and determined his salary. The Alps in 1755 were unknown territory for travellers and botanists and considered very hazardous. During Blaikie's trip, which earned him about £20 for eight months' travelling, he managed to send back 3500 plants and cuttings of 440 species. Blaikie is now credited with about thirty or so new plant introductions to Britain (Taylor, 53). The diary he kept during the expedition is recognized as an unusually detailed record of alpine life, mountaineering, and travel.

Through another Scottish gardener, the Hammersmith nurseryman James Lee, Blaikie received in 1776 the first of the commissions that established him as a notable gardener and landscape designer to the French aristocracy, and members of the French royal family, in the pre-revolutionary era. He was requested by the comte de Lauraguais to accompany a consignment of trees from Lee's nursery to the comte's Normandy estate at Mont Canisy, the beginning of a thirty-year association with the Anglophile Lauraguais. Blaikie's main work on the Lauraguais properties was the creation of *jardins à l'anglaise* (essentially a landscape where it was possible to wander and enjoy a variety of contrived ‘natural’ aspects and vistas complemented with glades, woods, hillocks, and streams) and ornamental farms.

In 1778 Blaikie accepted an invitation from the duc d'Artois, youngest brother of Louis XVI, to do similar work for him at Bagatelle, to the west of the Bois de Boulogne. Surplus trees were brought from the Mont Canisy and Manicamp gardens of Lauraguais to plant there. The pace of work was as erratic as the flow of money to pay for it, but there were enormous bouts of activity (involving hundreds of workers) when royal visits were impending or some other important function was to be held in the gardens. Plants were brought across the channel from

Blaikie's associates in England, including Lee and his partner Lewis Kennedy, as well as many thousands from the French royal nurseries including the Jardin du Roi in Paris. Demand was so great that Blaikie opened his own nursery at Bagatelle, later supplying other royal gardens. Completion of the Bagatelle gardens was marked in May 1780 by a fête attended by Louis and Marie Antoinette, with whom he developed a friendship.

Blaikie's third major commission of the pre-revolutionary period was for the duc de Chartres (later duc d'Orléans and during the revolution Philippe Égalité) at Monceau, where work began in 1781, Le Raincy, and St Leu.

Blaikie had a son, born to a servant, Thérèse, who worked at Bagatelle. He records payments to her but these apparently ceased after 1783. His amorous attentions to another servant named Barbe resulted in a daughter called Constance Blaikie. She was brought up by Citizen (Barbe) Thuillaux, who in 1803 renounced all claims to money from Blaikie. At some point Blaikie married Charlotte Letitia Lockier, who was born in Ringwood, Hampshire, about 1771, and was possibly the Betty, daughter of George and Mary Lockier, whose baptism is recorded there in May 1771.

The revolution proved financially ruinous to Blaikie, who was left to recoup wages and debts incurred by his royalist clients. In 1792, penniless, he narrowly escaped the wrath of the revolutionary guards, who ransacked his house and placed him and his wife under house arrest. In his diary he records harrowing descriptions of the fate of various of his aristocratic employers. Citizen Blaikie, having turned down the post of director of a national botanical school at Versailles, retired to Chauny as farm manager at the Lauraguais estate, supplying in 1793 the seed potatoes—a crop favoured by the revolutionary government as an alternative staple to wheat—which were cultivated in the Tuileries.

Trapped by the Napoleonic war in France, Blaikie worked on some seventy commissions between 1802 and 1815, including gardens for the empress Josephine at Malmaison and for Marshal Ney at Coudreaux. On the return of the Bourbons in 1814 King Louis Philippe (the duc d'Orléans) awarded him a pension of 600 francs per annum. He was invited in 1819 by the prince of Salm-Dyck to landscape his estate near Düsseldorf; Schloss Dyck, completed in 1820 and now restored, is the only one of Blaikie's gardens now to appear largely as it was when first laid out. In 1822 he made his first visit to Edinburgh in fifty years. After settling in Paris in 1825 he contributed to J. C. Loudon's *Gardener's Magazine* in London between 1827 and 1836, and continued to undertake commissions in France until well into his eighties.

Blaikie died on 19 July 1838 at his home in the rue des Vignes, near the Arc de Triomphe, Paris. He was buried in Montmartre on 21 July, but in 1962 the city of Paris removed his unclaimed remains to the Père Lachaise cemetery. His widow continued to live in Paris after his death, receiving an income from Corstorphine until her death on 20 May 1850. The publication in 1931 of Blaikie's two volumes of diaries, covering eight months in 1775, and from October 1781 to August 1792, renewed interest in his methods and achievement, as well as revealing ‘a man of undoubted charm, shrewd, frank, single-minded and with extraordinary physical stamina’ (Taylor, xiii).

LGM, 1838

Art. VI. *Obituary.*

Francis Blaikie, M.H.S. — By a letter received from Mrs. Blaikie, dated Paris, August 6., we learn that this venerable horticulturist and excellent man died in that city on the 19th of July, in his eighty-ninth year, and was buried on July the 21st. We trust that some of Mr. Blaikie's friends will enable us to give a memorial of Mr. Blaikie's life; which, considering that he was in France during the whole period of the revolution, is one of extraordinary interest.

very fine seed. Two or three quarts of these were left behind and sown in my own garden for private use. Planted in really good soil, a very fine yield resulted." He had a similar experience with Potatoes. "Nineteen hundredweight of Snowdrops were planted (on very poor

MR. P. BLAIR.

ground), cultivated and manured according to the most approved theoretical formula. The seed had been obtained from first-rate growers, and from good land. The entire crop of Snowdrops was thirteen hundredweight. After such a failure the growth of these varieties was, of course, discontinued, but the stock was sent to various remote districts. The result was surprising. One grower wrote the following season to say that the one hundredweight of Snowdrops had yielded an extraordinary crop of fine tubers, with which he had obtained six first and two second prizes at various shows." And, again, "A new variety of Radish was obtained, the best specimens grown were carefully selected, seed saved and sown. Some of this, sown on very poor land, produced plants which were not particularly good; the best were selected and allowed to seed, chiefly because the ground, being poor, was not needed. I have always thought with pride that the finest Radishes I ever grew were those obtained from the seed thus produced, although until recently no reason could be given for the result." These are facts worth thinking over, and the principles involved are worth testing. At present the ordinary practice is to destroy old seeds and poor plants growing on poor land, but if reliance is to be placed in Mr. Baker's experience—and it certainly has a rational backing—these might prove to be the most valuable in the whole garden. It is not very long, either, since a French experimenter wrote to recommend the sowing of old seeds of Marrows and Melons, so that his results went to confirm those of Mr. Baker.

July 13th.—The picture which appeared with my notes last week was a photograph of my lawn. The colour supplied by Lilacs, Laburnums, Azaleas, Rhododendrons and Mays cannot be shown, unfortunately, but the grouping is wonderfully effective. I wonder whether anyone could guess what caused the white splash in the right-hand corner. The photograph was taken from my bedroom window, and a spray of Wistaria happened to come immediately in front of the camera.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 146.—MR. P. BLAIR, AT TRENTHAM GARDENS, STOKE-ON-TRENT.

EVEN the fact that on the occasion of my visit to Trentham the weather was more like November than the last week in June, did not prevent me from appreciating the great beauty of the gardens, the splendour of the Duke of Sutherland's Staffordshire home, and the successful manner in which, under difficulties arising from climatic disadvantages, and the proximity of the chimneys of the Potteries, outdoor cultivation is carried on. As, however, it rained hard at the time of my arrival at Mr. Blair's pretty residence, he suggested that the fruit houses, which are a very great feature at Trentham, should be inspected at the outset, and, accordingly, we commenced the run of a mile, which represents the length of the glass. The first house we entered was one of the cool Orchid houses, and here were some very fine spikes of Odontoglossums. I remarked on the number, and Mr. Blair observed:—

"Stafford House is a big place to supply with flowers during the London season. We have cut two hundred spikes of Odontoglossums this week."

"And fruit, also?" I asked, as we passed into one of the late Vineries, with Black Hamburghs and Madresfield Court looking remarkably well.

"Yes, and fruit, too. The Vinery we are now entering was recently planted, and the varieties are Lady Downe's Seedling, Alicante, Gros Colmar, and Appley Towers. In the third Vinery half the space is devoted to Muscats and Gros Colmar. We consider Black Hamburgh our prop."

"How about Peaches and Nectarines?"

"In the early houses we have Royal George the best of Peaches, and Lord Napier, one of the finest of Nectarines; also Violette Hative. We crop very heavily. For instance, one day this week I sent twenty-three dozen Peaches and Nectarines to London, and another day ten dozen, all the fruit being fine enough to show."

"You have still some of the original cases?"

"Several. A portion of them have, however, been pulled down and new ones put up in their places. In this case Tomatoes and Figs are grown. The Figs are Brown Turkey, and the Tomatoes are a selection of my own, grown from seed which I saved. I have tried a great many varieties, but have found no advantage in growing them."

"What Strawberries do you force?"

"Royal Sovereign and Sir Harry. The former is the best, and we force about four thousand of them. We cannot grow Sir Joseph Paxton or British Queen here at all."

"Is that owing to the soil?"

"Partly, and partly to the climate. We cannot, for similar reasons, grow Peaches, Plums, or even Apples and Pears, out of doors. The soil is strong clay, loam and gravel. Though the gardens are in a hollow and sheltered, the climate is cold; and the fact that the river Trent runs through the gardens is not an unmixed advantage."

"When were the cases built?"

"They were built by Fleming between sixty and seventy years ago. The cases answer the purpose very well in the case of Cherries."

"You certainly have good crops. Are they easy to grow?"

"Quite. Only a little peat is required, the most critical time being at the flowering and stoning periods. The varieties are Black Tartarian, the Noble, Governor Wood, May Duke, Rivers' Early, and Elton."

"Which varieties of Plums do you go in for?"

"Jefferson's, Coe's Golden Drop, Transparent Gage, and Kirke's. Transparent Gage is the finest of all. In the late Plum house we have much the same varieties; and also Reine Claude de Bavay, a first-rate dessert Plum. In the late Vinery we have just entered we grow only Black Hamburgh, which we usually cut up to Christmas. The object is to get these as late as possible."

"You have some Tree Carnations in the pits?"

"About a thousand, for winter-flowering. I think that the pick of them are Madame Frau Frau, Mrs. S. J. Brooks, Winter Cheer, Lady de Ramsey, Mrs. T. W. Lawson, and Herbert Kitchener."

Passing through a Palm house, where, in spite of thirty-six Palms from ten to twenty feet high

TRENTHAM FROM THE GARDENS.

being in London, there was a goodly collection, we entered one of the Carnation houses."

"It is impossible to do Carnations well," said Mr. Blair, "unless they have a house to themselves. We grow most of the best varieties of Malmaisons, such as Mrs. Martin Smith, but the Princess of Wales and Thora are the most useful. When the Malmaisons are in flower we often cut about a thousand blooms in a week. Calypso is another favourite."

"Have you any of the very newest varieties?"

"Yes, the most recent one being the Duchess of Westminster. It was raised by Mr. Barnes, of Eaton, and flowers in April without trouble. The feature of the flower is that the calyx does not split, which is a great drawback with most other varieties of Malmaisons. The blue shade of the foliage is very striking."

"Apples in pots under glass seem to be an important feature?"

"We have about two hundred and fifty. In fact, Trentham is famous for its Apples. We have the finest dessert Apple grown—Calville Blanche. To get it to perfection, this must be grown under glass. It is grown largely in France; but it is no use out of doors."

"Of course, it is an expensive fruit?"

"When it is sold at the shops the price charged is half-a-crown an Apple. We pot the trees down annually, and they fruit about October, continuing until March. They are very good keepers. In colour the Apple is a fine transparent, rich yellow, of the most delicious flavour."

"Which is your earliest Apple?"

"James Grieve. Peasgood's Nonsuch, Lady Sudeley, and Beauty of Bath are very fine under glass; and among other varieties that do exceptionally well are Cox's Orange Pippin, Allington Pippin, American Mother, Wealthy, and Ribston Pippin. Of cooking Apples, Bismarck gets a beautiful colour under glass, and the varieties include Gascoyne's Scarlet, Bramley's Seedling, The Queen, and Newton Wonder."

Next we inspected an Orchid house, in which Cattleyas are grown for cut flowers, the principal varieties being Cattleyas labiata, Mossiæ, Mendeli, and Schroderæ, none of the choice hybrids being grown, as the former are found most useful.

In another Carnation house, I enquired how many houses there were set apart at Trentham for that flower.

"Five. This is the earliest, and the varieties include Cecilia, which is certainly one of the best. Here, too, are some of the Border varieties, notably Mrs. Herbert Cutbush and Sundridge."

In other Peach houses were Lord Napier and Violette Hative Nectarines, kept close to the glass and the light, in order to secure the splendid colour which is their characteristic.

"One tree seems to fill the entire house."

"Yes, that is a Lord Napier, from which last year I took six hundred and thirty-seven Nectarines. It is one of the original trees, and is about thirty years old. The house which it fills is quite forty-eight feet long."

"You have also a fine Brown Turkey tree in the Fig house?"

"It has been here about fifteen years, but it was a large tree when it was put in. The first crop is over, and a second is coming on."

"Pears you appear to grow largely on walls under glass?"

"Chiefly. We find that most of the varieties thrive on the walls. The finest of all Pears is Doyenné du Comice, but among others which do well here are Jargonelle, Louise Bonne of Jersey, Winter Nelis, Josephine de Malines, Beurré d'Aremberg, Beurré Rance, Marie Louise, Bergamotte Esperen, Beurré Fouqueray, and Le Lectier."

Before we reached the large conservatory, we inspected yet another Peach house, containing Bellegarde and Pineapple Nectarines; also Barrington, which take the Peaches up to the middle of October, none being grown after.

"The conservatory," continued Mr. Blair, "really serves the purpose of a small winter garden. Formerly it was full of Camellias, but we did away with them. Just now Palms and Bamboos predominate. In the winter, Chrysanthemums, which we grow in quantities, are brought here, and into the Peach houses."

"Is there anything special in the stove?"

"No; there are only the ordinary plants, such as Crotons. We grow a large quantity of Begonia Gloire de Lorraine, which we keep in flower six months of the year. It is particularly useful for decorative purposes."

"Do you grow many varieties of Melons?"

"I am trying a new one—Sutton's Invicta, which seems to promise well. Other varieties are Eastnor Castle, The Countess, Sutton's Superlative, Hero of Lockinge, and one or two selections of my own. I grow Melons in batches instead of having a house full of them at a particular time."

"What is the extent of the kitchen garden?" I asked, as we passed a pretty show of Flag Irises, and a large break of Sweet Peas comprising twenty-four of the best of the pinks, scarlets, whites, blues, and creams.

"About three acres and a half. The grounds, including the kitchen garden, cover about a hundred acres. The pits here are used for forcing Beans and Asparagus. We have Beans all the year round. Other houses include a late Vinery (all Hamburghs), another Vinery of Muscats, a third of Black Hamburghs and Foster's Seedling, and a house of Nectarines (Hale's Early)."

"You do not grow all your vegetables in the three acres and a half of kitchen garden," I observed.

"No; we have a piece of ground of two acres, where all the rougher vegetables are grown, such as Potatoes. Our early varieties of Potato are Sharpe's Victor, Snowdrop, Up-to-Date, and Windsor Castle. I am just trying Northern Star and Discovery."

"With regard to the pleasure grounds, what is the leading outside feature?"

"Rhododendrons and Azaleas, which, as you see, are getting over. We have a few single specimens of Rhododendrons, but they are mainly grown in clumps."

"How many bridges are there over the Trent in the grounds?"

"Three. The gardens also run on both sides of the lake, which is between seventy and eighty acres in area, the woods and hills being on one side. Hollies are very fine here. Our bed of Milkmaids is one of the finest in the county."

"What is the length of the archway near the terrace?"

"A hundred yards. It looks very pretty covered with Crimson Rambler."

From the front close to the conservatory attached to the mansion, which is used as a tea-room, there is a view of the monument erected on the hill by the tenantry to the first Duke of Sutherland. Here, also, the magnificent collection of Yews in the Italian Garden can be admirably seen. These Yews, twenty-four in number, are perfect specimens.

"How many varieties do you use for the two big beds in the Italian Garden?"

"Four, namely, Calendulas, Pentstemons, Lythrum roseum, and Candytuft. These make a mass of colour when the family are in residence at the end of July. The beds on the terrace are principally filled with Geraniums, Calceolarias, Violas, Candytuft, and other showy flowers."

"You do not have Roses in the beds?"

"The manufactories and chemical works in the neighbourhood prevent us from growing either Roses or Violets. They also affect the Conifers and the trees in the park. Plants and shrubs which used to flourish at Trentham years ago, before they existed, will not grow now."

"Do you decorate the entrance to the mansion elaborately?"

"Only when the King, or some other illustrious personage, visits the Duke and Duchess. In the corridors on each side we have flowering plants."

With a glance at the noble front of Trentham, and the charming little garden surrounding the model dairy, we paused to notice a wall covered with some wonderful Ivy.

"That variety," said Mr. Blair, "is the Amurensis, and does better than the old dentata. It lasts all through the year, and is very much admired."

If it had not been for the pouring rain, we should have spent much more time in the open, but we were obliged to retrace our steps to the houses which I had not seen.

In one of these was a lovely show of Masdevallias and Oncidium macranthum.

"You grow these Orchids in great quantity?" I remarked.

"There are a couple of thousand of Masdevallias. Both the varieties flower from April to the end of July, and the long sprays are valuable for decorating the tables. They do so well for groups of plants."

"I see that you have Hydrangeas in the show house?"

"We fill the show house with things in season. Just now, in addition to Hydrangeas, there are Fuchsias, Geraniums, and Lilium longiflorum giganteum. From a single bulb of the last we had twenty-six flowers. By the way, although Roses will not grow at Trentham, we have an orchard at Hanchurch, a mile away, on higher ground, containing some fine old Yews, where outside Roses of different varieties do very well."

"Does the soil suit Rhododendrons, or have you to make it suitable?"

"We have to prepare all the beds before the Rhododendrons are planted. There is plenty of peat in the locality for the purpose. According to my experience, Rhododendrons cannot be grown without peat."

"I suppose that in the season you grow a quantity of Lilies?"

"A great quantity, and also of Lilacs. As to Chrysanthemums, we grow between three and four thousand, about a thousand for large blooms."

"When did you come to Trentham, Mr. Blair?"

"I have been here nineteen years as head gardener, and I had been foreman for four years previously."

"Then you have not held many other appointments?"

"No. I started under my father at Shrublands Park, Suffolk. Then I went to Trentham Gardens as foreman under the late Mr. Stevens, where I stayed four years. Afterwards I was appointed to Messrs. Veitch's as foreman in the decorative department, and there gained great experience in decoration, which, subsequently, proved very useful to me. I stayed there eight years, until appointed to fill my present position."

"I should be glad if you would tell me something about your record in exhibiting."

"I have done a good deal since I have been at Trentham, principally showing groups of plants for effect, with very great success, but I gave it up four years ago, after I beat Mr. Cypher, at Shrewsbury, in a large group of decorative plants. Previously, I had taken the challenge cup at Hull, a first at Manchester and York for groups of plants and Chrysanthemums, and also prizes at all the local shows."

"But not in the South?"

"I have not shown in the South. The distance is greater, and they give better prizes in the North. Since the Shrewsbury show in 1900, I have gone in for judging, instead of showing."

"How large is the staff under you?"

"The number of men employed in the grounds and houses is forty-five. There is accommodation for thirteen in the bothy. The Duke opens the park without any restrictions to the public, and, though a great quantity of flowers are used to decorate at Stafford House, the Duchess gives away largely."

ALFRED WILCOX.

GLADIOLI are sometimes left in dry, warm soils all the winter, but they are always better taken up and stored indoors. In some soils Gladioli are somewhat disappointing, especially among the imported or purchased bulbs.

VOL. LIII.—No. 2,975. SATURDAY, NOVEMBER 5, 1910.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

International Horticultural Exhibition, 1912.

The meeting of the General Committee of the International Exhibition, to be held in London in 1912, of which a report appeared in our issue of the 29th ult., was of considerable importance and much interest. It was the first meeting which gave the Executive Committee an opportunity of stating publicly, or what was akin thereto, what had been accomplished during the six months that had elapsed since the meeting was held at which it was decided to hold an exhibition of an international character in the year mentioned. The meeting also afforded an excellent opportunity for obtaining an idea of the interest that is being taken in the proposed exhibition by the general body of horticulturists in the United Kingdom. We certainly regard the meeting as a safe base on which to form an opinion upon the latter point, and the presence of about one hundred and fifty of the leading horticulturists, many of whom had travelled long distances, should be an ample proof that the interest is widespread, and that there is a strong desire to assist in making the exhibition a brilliant success, and in every way worthy of a great country, world renowned for both the practical and scientific aspects of its horticulture. Mr. Gurney Fowler, who is the chairman of the Executive Committee, presided at the meeting in question, and gave a somewhat lengthy, but by no means too long, statement of the steps that had been taken in various directions since the last-named body had been formed. He stated at the commencement of his remarks that at the meeting held in April, when the exhibition was decided upon, a Provisional Committee was appointed to take the preliminary steps, and that this Provisional Committee had a meeting, and invited other gentlemen to assist in forming an Executive Committee. The first matter to receive attention on the last-named committee having been constituted was finance. It was at once recognised that the carrying out of the exhibition on the scale contemplated would necessitate a large expenditure, and it was also recognised that in the event of a loss the members of the Executive Committee would have to bear it. After a full consideration of this all-important question it was decided, as recorded in the report of the meeting which appeared in our issue of the 29th ult., to form a limited liability company. The next step was to form a General Committee, and to prepare a scheme for local committees, and to appoint secretaries of such bodies. A meeting of the latter was held previous to luncheon, as will be seen on reference to the report which appears in another part of this issue. Forty attended, and certain resolutions were passed. The probable cost of the exhibition was dealt with, and the privileges of subscribers and guarantors mentioned by the chairman. The preparation of the schedule, the selection of a site, and some other matters were referred to, and, as far as it went, the statement was satisfactory, but it hardly went far enough. The members of the General Committee were told that it had been said by some of the critics that the exhibition in 1912 would be a glorified Temple Show, and that the Executive Committee intended to hold a real international exhibition. We shall hope, and, indeed, expect, that the exhibition will be of a quite different character to the beautiful shows that have for upwards of twenty years been held in the gardens of the Inner Temple. The fact that the Schedule Committee has been engaged for several months in the preparation of the schedule should be a proof that the show will be of a different character. We have no doubt that cultivators will have such encouragement as will induce them to contribute of their best, and that there will be a large display of such subjects as are available for exhibition in the month of May. We have no apprehension as to the extent of the exhibition or of the quality of the plants, flowers, fruits, and other products; but we should like to know something about the manner in which they are to be displayed. Are they to be arranged in tents, such as have been in use at flower shows held in this country from time well-nigh immemorial? Or will exhibition houses be provided that are large enough for the artistic arrangement of the various objects, and are light and elegant in design, such as those at the international exhibitions at Ghent, Haarlem, Hamburgh, and other of the Continental centres? These are important questions, and unless the second of the two is answered in the affirmative the exhibition will fall short of what it should be. As yet nothing has been said with regard to the educational side of the exhibition, which should be on a considerable scale; or to the holding of a congress for the purpose of discussing matters of importance to horticulturists at home and abroad. It is most desirable that advantage should be taken of the opportunity the exhibition will afford for learning the views of our foreign friends upon the difficulties that have been placed in the way of British horticulturists in sending plants, etc., to a considerable number of European countries. It is advisable that countries should do what is necessary to prevent the introduction of

MR. PETER BLAIR.

insect pests and fungoid diseases, but the regulation should not be so drafted as to practically exclude stock that is perfectly clean, and may not be liable to infection. The formation of the Executive Committee into a limited liability company is not a matter to which objection need be taken, more especially as it places the committee in a better position to deal with those with whom they have to enter into business relations. We attach but little importance to its protective side because we are fully assured that when the full scheme is made public, provided it is commensurate with the character and the importance of the occasion, and an estimate given of the probable cost, the necessary funds will be forthcoming, and the sooner this is done the better. We are, indeed, of the opinion that it would have been an immense advantage had a broad outline of the scheme been published within a reasonable time of the formation of the Executive Committee.

Mr. Peter Blair, whose portrait we have the pleasure of giving in this issue, has so long occupied a prominent position among British horticulturists by reason of his remarkable ability that there is no occasion to make otherwise than the briefest reference to the excellent work he has accomplished. It is now many years since Mr. Blair was appointed to the charge of the Trentham Hall gardens, so long famous for fruits and flowering plants, and those who visited them in the days when the bedding system was in vogue will well remember the success achieved in the arrangement of the various classes of tender plants utilised in the production of summer effects. They will remember also the many valuable object-lessons that were to be obtained in the quarters devoted to fruits, and in the various fruit houses which have long constituted a great feature at Trentham. Mr. Blair has shown his administrative ability in other directions, and nowhere has it been more conspicuous than in the carrying out of the arrangements of the horticultural exhibitions held in conjunction with the shows of the Royal Agricultural Society and the Yorkshire Agricultural Society. The exhibitions held at Liverpool and Leeds during the past summer under Mr. Blair's superintendence were so remarkable for the completeness of the arrangements, as to afford examples that many secretaries of societies may follow with advantage.

Mr. Leonard G. Sutton was unanimously elected president of the Berks and Oxon Chamber of Agriculture for the ensuing year, at the annual general meeting, which was held at Reading on the 29th ult.

Election of Chief Officer of London Parks.—At the meeting of the London County Council, on Tuesday, the election of a Chief Officer of the London parks under the control of that body was proceeded with, and, as we stated in our issue of last week, the General Purposes Committee recommended the appointment of a military officer to the post. There were 145 candidates for the post, and from these sixteen had an interview with a sub-committee of the General Purposes Committee, and from these six were selected to meet the latter body. These were Mr. A. D. Blascheck and Mr. A. M. Caccia, of the Indian Forest Service; Mr. W. H. Morter, superintendent of the Birmingham Parks and Gardens; Mr. J. Weathers, horticultural instructor, Middlesex County Council; Major P. Maud, R.E., of the General Army Staff; and Major C. B. Winter, of the Indian Army. The General Purposes Committee selected Mr. Blascheck, Major Maud, and Major Winter, and recommended that Major Maud be appointed. Mr E. Gray, the chairman of the General Purposes Committee, in bringing up the recommendation, contended that the Council did not want "a Chief Gardener," but the "Head of a department," which was absurd, seeing that in this case administrative ability should be combined with technical knowledge of a high order. Strenuous endeavour was made by several members to have the recommendation referred back, but, on a division, the amendment was lost by 69 to 47. The recommendation was then agreed to, and Major Maud was introduced, and informed of his appointment.

Flowering of Fruit Trees.—At the general meeting of the Royal Horticultural Society on Tuesday next Mr. C. H. Hooper will give a lecture on "The Blossoming of Our Hardy Cultivated Fruits."

Orchids at Manchester.—A most interesting group of orchids was exhibited by Mr. E. Rogers, gardener to O. O. Wrigley, Esq., Bridge Hall, Bury, at the recent meeting of the Manchester and North of England Orchid Society, at the Coal Exchange, Manchester. The group extended to two-thirds the length of the centre tabling, and made a most remarkable display. The most prominent features were the finely grown examples of Vanda cærulea. Not only had these remarkable spikes of flowers, but the colour and substance of the flowers left nothing to be desired, which is the more noteworthy when it is considered that the plants have been grown under the smoky conditions of this particular neighbourhood. These remarks may also be applied to the large quantity of Dendrobium phalænopsis Schroderæ shown, which included a remarkably well-flowered plant of the rare D. p. hololeucum. Clusters of Epidendrum vitellinum, Cypripedium Fairreanum, C. Maudiæ, Odontoglossum grande, etc., were also included. Mr. Rogers was deservedly awarded the society's gold medal for high culture.

The Winter Moth and the destructive effects of its larvæ, was dealt with in an interesting and instructive paper by Mr. A. J. C. Biss, read at the fortnightly meeting of the Bath Gardeners' Debating Society. Mr. Biss described the life history of the moth, and the best means of preventing and checking the ravages of the caterpillars.

R.H.S. Trial of Peas at Wisley.—The Rev. W. Wilks writes: At a meeting of the Council of the Royal Horticultural Society on October 25, a letter was read from one of the leading seed firms, pointing out that it was not quite fair in the trial of peas at Wisley to compare, and to adjudicate on the merits of, varieties sown on different dates; and urging that all peas sent for trial ought to be sown on one and the same day. The Council quite saw the point, but felt, on the other hand, that it would not be quite fair to an admittedly late pea to sow it on the same day as an admittedly early one. After consideration it was decided for 1911, and in future, to ask for one pint (instead of half-pint) of seed peas, and divide it into three parts and make sowings of all varieties on three different dates, suiting early, mid-season, and late peas, as in this way only could the two difficulties mentioned be overcome. It is desired therefore to correct the list of trials which appeared in these columns a fortnight ago, by substituting one pint for half-pint of pea seed required to be sent to Wisley.

Lecturer in Horticulture for Fife.—At a recent meeting of the Education Committee of the Fife County Council Mr. George E. Greenhow, assistant lecturer in horticulture to the Edinburgh and East of Scotland College of Agriculture, was appointed resident lecturer in horticulture for Fifeshire, at a salary of £150, rising to a maximum of £250. Mr. Greenhow is a native of Cumberland, and began his career in the gardens of Hatton-in-the-Forest, Cumberland, the seat of Sir Henry Vane, Bart. After serving for several years as journeyman and foreman in the private gardens at Greystoke Castle and Styford Hall, he was engaged for a year with the Northumberland County Council as gardener at Cockle Park, Morpeth. He had charge of the fruit plots throughout the county, and he had also the supervision of the forestry section.

R.H.S. Awards to Fruits.—A special sub-committee of the Fruit Committee of the Royal Horticultural Society visited Wisley on October 13, and recommended Awards of Merit to the following, which were confirmed by the council at its meeting on Tuesday, October 25: Apple, Hounslow Wonder, Messrs. Spooner, Hounslow; peach, Salwey, the Duke of Richmond, Goodwood.

Yorkshire Horticultural Society.—This is the title of the new horticultural society which it was decided to found at a well-attended and enthusiastic meeting held in the Town Hall, Leeds, on Tuesday, October 25, under the presidency of the Lord Mayor. The hope was expressed at the meeting that everyone resident in the northern counties of England would support the society, but as yet the northern counties have not been approached in the matter. It was resolved that the minimum subscription for honorary members be one guinea, and for amateur and professional gardeners five shillings. A strong committee has been formed, and if the enthusiasm shown at the meeting be expressive of the feeling that obtains in Yorkshire with regard to the desirability of forming the society, there is full justification for anticipating that the society will assume large proportions and do splendid work in the advancement of horticulture in the Northern Counties. There is ample room for a strong horticultural society in the North of England, and we trust the new society may achieve a high degree of success. It appears highly desirable that other of the great centres in Yorkshire should co-operate with the horticulturists of Leeds in this important undertaking. The secretary is Mr. P. Clapham, Calverley, Leeds, and Mr. H. J. Clayton, Ulleskelf, is the treasurer.

Dahlia Brentwood Yellow.—Concurrently with the opening of the chrysanthemum season we received from Mr. J. T. West, Tower Hill, Brentwood, a box of blooms of his new decorative dahlia Brentwood Yellow, which he introduced to public notice for the first time at the exhibitions held during the past season. Mr. West has sent us a dozen or so growths, and the majority of these bear two well-developed blooms and buds. The blooms are large, full, of fine form judged from the decorative point of view, and borne on stiff, erect stems, of a sufficient length to carry them well above the foliage. The height of the plant ranges from 30in. to 36in., in height, and it is not difficult to imagine the fine effect produced by masses of the rich golden flowers.

BLAIN Henry Haughton of Ardmore St. Georges-road Abergele **Denbighshire** died 7 July 1937 Probate **Liverpool** 26 August to Agnes Helena Blain spinster and Midland Bank Executor and Trustee Company Limited. Effects £8002 6s. 1d.

BLAIN William James of 125 Ranelagh-road East Ham **Essex** died 26 June 1937 at Central Home Leytonstone Essex Probate **London** 24 September to Lydia Spurway Blain and Alice May Blain spinsters. Effects £704 15s. 8d.

BLAIN William Neill of Fossdene Mount Pleasant **Cambridge** died 6 October 1937 Administration **London** 30 October to Honoria Mabelle Long-Brown married woman.
Effects £256 8s. 8d.

BLAIR Andrew of 12 Edinburgh-road **Bathgate** died 28 July 1937 Confirmation of Margaret Blair.
Sealed **London** 25 October.

BLAIR or **GIBSON** Christina Ure of Endycot Dewar-street **Dollar** widow died 17 May 1937 Confirmation of the reverend James Thomas Hall and the reverend George Lyall clerks.
Sealed **London** 24 August.

BLAIR David Logan of Firfield Golf-road Clarkston near **Glasgow** died 24 March 1937 Confirmation of Eliza Jane Ann Blair and James King Walker writer. Sealed **London** 22 May.

BLAIR Ernest of Hillfield Underhill-road Cleadon county **Durham** died 14 March 1937 Probate **Durham** 6 September to Florence Jane Blair widow and Donald Harvey solicitor.
Effects £5135 6s. 2d.

BLAIR Frederick Henry of Glenroy 29 Bradley-road Trowbridge **Wiltshire** died 21 August 1937 Probate **Winchester** 5 November to William Frederick Mackett solicitor and George Frederick Snailum auctioneer. Effects £13313 11s. 8d.

BLAIR Harriett of 67 Fredericks-road Beccles **Suffolk** widow died 5 February 1937 Probate **London** 22 March to Samuel Edward Roofe dealer and James Brindy retired postal official.
Effects £99 13s. 1d.

BLAIR or **HARVEY** Helen of 49 Bannockburn-street **Greenock** died 12 May 1937 Confirmation of Colin Finnie clerk.
Sealed **London** 2 July.

BLAIR Jane Ann of Beacon Hill Cottage Sadberge county **Durham** widow died 16 July 1926 Administration **Durham** 16 June to Thomas White Taylor hay cutter. Effects Nil.

BLAIR Jane Ann of 7 Lonsdale-terrace Crosby Villa Aspatria **Cumberland** (wife of Tom Blair) died 19 August 1937 Probate **Carlisle** 28 September to Susanna Lowther (wife of Robert Lowther) and the said Robert Lowther railway guard.
Effects £406 10s.

BLAIR John of Waterside Coleraine county **Londonderry** died 22 September 1936 at Prospect-road Portstewart county Londonderry Administration **Belfast** to Robert Thomas Blair grocer. Effects £374 9s. 9d. in England.
Sealed **London** 27 May.

BLAIR John Albert Horace Frederick of Aberglebe Stourbridge-road Bromsgrove **Worcestershire** died 27 October 1937 Probate **Birmingham** 15 December to Milly Blair widow.
Effects £878 19s. 2d.

BLAIR John Hunter of 19 Sloane-court **London** died 25 January 1937 at 8 Beaumont-street London Probate **London** 4 March to Evelyn Hunter Blair widow Arthur Croke Morgan solicitor and Eustace Alfred Skinner Oldham stockbroker.
Effects £171200 9s. 2d. Resworn £166442 12s. 8d.
Resworn £166450.

BLAIR or **WILLIAMS** Josephine of 29 Ennismore-road Stanley **Liverpool** spinster died 8 March 1937 at Rainhill Lancashire Administration **Liverpool** 16 November to Alberta Stella Williams spinster. Effects £156 9s. 4d.
Former Grant (in the name of Josephine Williams) D.R. **Liverpool** 19 July 1937 Revoked.

BLAIR Laura Constance of 33 The Avenue Kew-gardens **Surrey** widow died 13 March 1937 Probate **London** 21 May to Barclays Bank Limited. Effects £3982 7s. 3d.

BLAIR or **FILSHIE** Leslie Ward of 7 Sandringham-terrace **Greenock** died 8 August 1937 at Rothesay Confirmation of John Dickie retired surveyor David Blair Williamson electrical engineer and David Laird Boyd solicitor.
Sealed **London** 30 October.

BLAIR Margaret of 33 Woodvale-road **Belfast** spinster died 29 January 1937 Probate **Belfast** to Robert H. Blair brass founder and James Macartney flax spinner.
Effects £585 9s. 5d. in England. Sealed **London** 6 April.

BLAIR Margaret otherwise Maggie of Cluny **Dunblane** spinster died 3 February 1937 Confirmation of reverend Robert Leighton Blair clerk and James Fisher Lindsay.
Sealed **London** 12 April.

BLAIR Nina Richmond of Atley Ranch Oliver British Columbia **Canada** widow died 17 September 1936 Probate **London** 19 February to Henrietta Richmond Blair spinster.
Effects £3777 9s. 2d. Resworn £4452 14s. 6d.

BLAIR Peter of 14 Lydgait **Haddington** died 23 February 1937 Confirmation of Alexander Ramsay (the younger) shoemaker and George Shaw commercial manager.
Sealed **London** 8 June.

BLAIR Peter of 101 Fairbank-road **Sheffield** died 25 August 1937 Probate **Durham** 25 November to Marion Blair and Elsie Moir Blair spinsters. Effects £203 8s. 5d.

BLAIR Peter Christie otherwise Peter of Hobart Lindum-avenue ~~Trentham~~ **Stoke-on-Trent** died 23 October 1936 Probate **Birmingham** 17 February to Doris May Blair spinster.
Effects £567 4s.

BLAIR Robert Douglas of 19 Hereford-road **Harrogate** died 2 February 1937 at Seletar Singapore Straits Settlements Administration **London** 16 August to Constance Blair widow
Effects £958 19s.

BLAIR Robert Westrup of Kuala Lumpur State of Selangor **Federated Malay States** died 10 October 1937 at 20 Devonshire-place St. Marylebone Middlesex Probate **London** 2 November to Victoria Marianne Prenter Blair widow. Effects £500.
Resealed **Singapore** 3 February 1938.

BLAIR Rosina of Blenheim 59 Dartmouth-road Paignton **Devonshire** (wife of William Blair) died 21 January 1937 Probate **Bristol** 26 February to Herbert Nelson Blair station master.
Effects £710 7s. 5d.

BLAIR Thomas Allan of 48 Meadway Ilford **Essex** died 30 April 1937 at King George Hospital Ilford Probate **London** 17 June to Henry Moses Geeson assurance inspector.
Effects £1930 6s. 4d.

BLAIR William of 66 Old Chester-road Lower Tranmere **Birkenhead** died 20 March 1937 at 56 Church-road Higher Tranmere Birkenhead Administration **Chester** 30 April to Hettie May Blair widow. Effects £558 17s.

BLAIR William of Shaken Bridge Brow Top near Bolton **Cumberland** died 31 March 1937 Probate **Carlisle** 16 June to Esther Blair spinster and Joseph Wells Crookes solicitor.
Effects £1118 12s. 9d.

BLAIR William Nisbet of 38 The Pryors East Heath-road Hampstead **Middlesex** died on or since 26 July 1935 at some place unknown Administration **London** 7 January to Kenneth Gloyne Blair zoologist. Effects £1635 9s. 1d.

BLAIRMAN Wolf otherwise Walter of 805 Finchley-road Golders Green **Middlesex** died 11 September 1936 Probate **London** 10 February to Irene Blairman widow.
Effects £15115 8s. 2d.

BLAIRS Daniel of 38 Dimsdale View Porthill Newcastle-Under-Lyme **Staffordshire** died 29 May 1937 Administration **Chester** 19 October to Laura Blairs widow. Effects £565 9s. 6d.

Thomas Blair

Gardeners' Chronicle 1875, n.s. 4

Mr. Thomas Blair, whose portrait we publish to-day, was born in the year 1819, at Aberdour, Fifeshire. He was early sent to the parish school, where he remained until he was fifteen years of age, at which period he went to Fordell, the seat of Admiral Sir Philip C, H. Durham, and there he served his apprenticeship under Mr. Robert Foulis, who is still head gardener and land steward — a situation which he has filled for nearly fifty years.

After going through the different departments of the garden establishment, under the careful direction of Mr. Foulis, he removed, for further improvement, to Whittingham, in East Lothian, then noted as one of the best kept gardens in Scotland, and here he commenced to collect the native plants and to study their names and peculiarities, with the assistance of a companion, who has now been for many years in America. After spending nearly two years at Whittingham, he engaged to go as foreman in the flower garden at Castle Temple, in Renfrewshire, and the year following had charge of the forcing department, which was extensive, and included the cultivation of various kinds of tropical fruits. He still, however, continued to pay some attention to the collecting of wild plants, the west of Scotland affording a good hunting-ground for them, so that he and his companions had frequent rambles over hill and dell in their pursuit, and they were, he tells us, always rewarded with something interesting.

“Having served two years at Castle Temple, I left Scotland,” writes the subject of our memoir, “and went to Mr. Jackson's nursery, Kingston-on-Thames, at that time famed for its fine collection of Cape Heaths and other exotic plants, and, indeed, the Kingston nursery has not lost its good name, but still maintains a high position as a plant nursery. After being over a year among the plants, I was sent by Mr. Jackson to take charge of the exotic department at the Royal Gardens, Claremont, under Mr. Malleson, the head gardener, and I remained nearly four years there, which ended my period of probation.

In November, 1845, I was engaged as head gardener to Mr. Dundas Durham, Largo House, Fifeshire, where I spent nine years comfortably; but, being desirous to advance in my profession, I entered the service of G. C. Arbuthnot, Esq., Mavis Bank, near Edinburgh, whose gardens were about to be renovated and improved, and remained there between two and three years, when Mr. Jackson, of Kingston (who had not forgotten my former services), offered me the situation at Bank Grove (the late W. Byam Martin), near Kingston-on-Thames, well known for its fine collection of Camellias, Roses, American plants, and rare Coniferae.

I left Bank Grove in the spring of 1862, and was recommended by Dr. Lindley to Admiral Sir George N. Broke Middleton, Bart., as head gardener at Shrubland Park. Of the gardens here it is not necessary that I should speak, their extent and variety being well known, and their keeping being admired by all who have seen them. Sir George Broke Middleton's taste for the beautiful is well known, and he is also a liberal supporter of the horticultural and agricultural societies in the neighbourhood.”

A.W. Blake

THE GARDENS OF THE EARL OF CARNARVON, AT HIGHCLERE CASTLE, NEWBURY.

IT was my good fortune to be able to spend a considerable amount of time on a glorious May day in the gardens at Highclere Castle. The more I saw of them the more I was confirmed in my first impression of the Earl of Carnarvon's famous historic seat. Highclere is majestic, from the magnificent castle, upwards of five hundred and fifty feet above sea level, to the far-stretching woods which form the framework of the pleasure grounds. And the gardens, in their expansiveness and their arrangement, completely harmonise with the architecture and appearance of the castle. The majesty of style is, in fact, preserved everywhere. Highclere is the centre of big things; the little ones do not count. As I started on a walk round in company with Mr. A. W. Blake, the head gardener, I told him I should only deal with the big things, and he said that the rest did not matter. Unquestionably, the trees largely contribute to the majesty of Highclere, whether in respect of age, size, or beauty.

A THOUSAND-YEAR-OLD YEW.

One of the most venerable stands like a sentinel under the shadow of the castle, in the shape of a wonderful Yew. Its age exceeds a thousand years, and it has been decaying for centuries. But there is a good deal of life left in it yet. There is not only life, but vigour in the Cedars, Beeches, Oaks, Black Walnuts, Chestnuts, and other specimen trees which abound in the park, and are amongst the ornaments of the gardens.

"Highclere," said Mr. Blake, "is one of the homes in England of the Cedar, and cuttings came here from Wilton soon after it was introduced in this country. Hence the presence of so many giants. The Cedar just outside the gardens at the east of the castle, which you see is entirely unsupported, was grown from one of the cuttings. It is the finest of all. In height between one hundred and fifty and one hundred and sixty feet, and of symmetrical proportions, it is two hundred and twenty feet through, and the butt is twenty-seven feet in circumference at two feet from ground level. But everywhere, as we proceed, you will observe the health and vigour of the trees of all kinds and every age."

"They are in keeping with the character of the place, or, perhaps, I should rather say, that they help to make it up; and so do the lawns, whose dimensions must be remarkable."

"There are thirty-six acres of lawns, chiefly undulating, which, of course, adds to their attractions. They are emphatically one of the striking features of Highclere, and no pains are spared to keep them fresh and green, pleasant to the eye and pleasant to walk upon. From the south lawn you get a fine view of the highest point of Highclere, Heaven's Gate, on Seddon Hill, nine hundred feet above sea level. The hill itself is clothed with Silver Firs, Beech, and Ash."

"But there are charming views from every lawn?"

"Yes, the country, whichever way you look, is delightful. Nature has been allowed to maintain her sway, and the variety of scenery increases its charms."

THE SHRUBBERY BORDERS.

At this point we paused near the base of one of the slopes to inspect closely a cluster of four splendid Beeches, and here Mr. Blake mentioned an important change which has been made during the five years he has been in charge of the gardens.

HIGHCLERE CASTLE, THE SEAT OF THE EARL OF CARNARVON.

"When I came to Highclere," he continued, "there were numerous displays of bedding on the lawns. They have all been done away with, and the new shrubbery border, started in March, 1911, with its three divisions, now contains our only show of mixed flowers. The border, which is broken up into three divisions, is about nine hundred yards long. The shrubs at the back include Staphyleas, Lilacs, Crabs for colour effect (chiefly John Downie), Golden Yews, Golden Cypress, the Sea Buckthorn, Berberis, Buddleia in variety, Paulownia, and most of the Conifers, which will do well in chalk soil."

"How is the border planted? Is it divided up for colour effect?"

"In three divisions. One is mainly a blue border, the second as far as possible pink, and the third lavender. In the blue border Delphiniums and Anchusas are prominent, with an edging of Viola Kitty Bell. The pink border is chiefly planted with pink Sweet Williams and Antirrhinums, the edging being of Viola Maggie Mott. We use the same edging for the lavender border, in which Lavender is a predominating element. The shrubs, generally speaking, harmonise with the Lavender, the main object of the borders being to give a suitable finish to the pleasure grounds."

A PICTURESQUE ROSE GARDEN.

In close proximity to the shrubbery border is the principal Rose garden, and I asked the plan of it.

"The primary purpose is to secure masses of colour. For example, there are four beds of Lady Ashtown, containing twenty-six dozen plants, with standards, four beds of Dorothy Page Roberts, and Paul Transom on poles. Hugh Dickson fills a very large bed. The arches of the wall which runs across a portion of the garden, are adorned with Ceanothus Gloire de Versailles; and behind the clump of Box at the end rises the head of Charlemagne. Below is a border of Golden Tulips and Myosotis. Through the arches we pass to pergolas of Yews."

"And a very effective border of May-flowering Tulips."

"The variety is Mrs. Farncombe Saunders, and with it is associated Viola Maggie Mott. This Tulip likes a cool atmosphere. It has been in flower all the month. On the wall above are climbing varieties of Roses. Further beds of Roses contain Madame Abel Chatenay and Madame Grolez, with Paul Transom on pillars; and a carpet of J. B. Riding. Behind the quaint old hedge are Roses on pillars, Hiawatha, Lady Gay, and Irish Beauty. Beds of red Roses are carpeted with Viola Swanley White; with Lady Gay, Viola Countess Campana is used; and with Jersey Beauty, Kitty Bell."

RHODODENDRONS IN THOUSANDS.

Ascending the slopes, the Azaleas and Rhododendrons challenged admiration. In all directions were magnificent masses of colour, and the air was delightfully perfumed. I singled out for special comment the gem of the whole, a huge bed of Rhododendron Pink Pearl flowering, and coming into flower.

"How many plants are there in that bed?"

"Exactly one hundred. Judging by the outside small plants, which average forty-three buds or flowers, there must be quite five thousand trusses of flowers and buds in the bed. This is the third year the bed has been in flower, and I think it looks its best this season."

"Next to the Pink Pearl, and indeed hardly next to it, is the Rhododendron Cynthia, which as you see, also throws out glorious trusses of rich colour, the height of some of the plants being ten feet. Close to the bed of Cynthia is a Rhododendron which comes into flower quite late in the season, and forms an excellent combination with an edging of white Heather. It would be impossible to speak of all the Rhododendron beds, but the principle we are observing is to sweep out all the mixtures and substitute varieties of one colour."

"Do you put peat in the soil?"

"All the Rhododendron beds are made with peat obtained on the estate, the ground being excavated three feet, and lined with clay. But if you feed shrubs annually, you can grow almost anything."

THE AZALEA BEDS.

"You observe the same principle in reference to Azaleas?"

"They are grown in masses both in beds and borders, the one-colour idea always being kept in view. One of the most effective beds is made up of golden Azaleas; in another, the late-flowering Ghent Azaleas, with a sundial in the

centre, in the shape of a wheel, seventy-two feet through. Many of the Azaleas have been raised as seedlings, and one of these plants, with salmon-pink flowers, is ten feet through, and thirty feet round. Almost every shade of colour, from delicate gold to deep orange, is represented by the Azaleas, and the season is one of considerable length. Later on Kalmias, which are just showing flower, will help to make a show. I said just now that Highclere is one of the homes of the Cedars, but it is supposed to be the original home of the first hybrids raised from the Ponticum Rhododendrons."

Mr. Blake showed me the original plant, which is quite a huge tree, twenty feet high, and seven or eight through. In this neighbourhood, too, I made the acquaintance of a Cedar planted in 1847 by the then King of Spain, and not far off another of the same tribe planted by King Edward when Prince of Wales. The latter formed one of a group planted to commemorate the Jubilee of Queen Victoria. Then, after a peep into the sunk Rose garden, planted chiefly with Caroline Testout and a groundwork of Viola Kitty Bell, Mr. Blake informed me that Roses were being substituted for other flowers in all parts of the pleasure grounds.

"They begin to bloom in the middle of June, and go on more or less to the middle of October. In fact, if the weather is open, there are some in flower at Christmas. This applies especially to the new Hybrid Teas. Nothing, I think, is more calculated to maintain the dignity and beauty of the gardens than the provision of great masses of colour, such as Roses are able to supply. It is also far better to have a large quantity of a few varieties than a few of several. Of all points in Rose growing, none is more essential than to find out the varieties which do the best in your district, and when that has been ascertained, to adhere strictly to them."

RHODODENDRON PINK PEARL.

THE PLANT HOUSES.

The kitchen gardens and plant houses are on a scale commensurate with the pleasure grounds at Highclere. The latter include a flowering house, which at the time of my visit contained a magnificent show of Schizanthus of every shade of colour; a fine collection of Tree Carnations; a number of Indian Azaleas; Lilium giganteum in pots, with nine flowers to a plant; a remarkable collection of Calceolarias; and a large quantity of Hydrangea hortensis with blue flowers, the blue shade being obtained by the use twice a week of sulphate of iron, one ounce in a gallon of water. Other houses are devoted to Grapes, Figs, Peaches, and pot-fruit, including Nectarines, Cherries, Apples, and Plums, all promising satisfactory crops.

There are many notable features in the eight acres devoted to the cultivation of hardy fruit and vegetables, and decorated in the centre with a very fine herbaceous border. Special prominence is given to forcing early vegetables, and a long succession is thus maintained in the supply of Peas, Potatoes, Beans, Cauliflowers, and Carrots.

"I should like you," said Mr. Blake, "to see the house in which I grow Climbing French Beans."

"Do you find that they answer better than growing Beans in pots?"

"Distinctly, and they are less expensive to grow in this manner. Sown in February, they give a supply from early in April to the middle of June. The varieties are Tender and True and Princess of Wales. Tomatoes are grown largely in pots, sown in November and ready in April. Cucumbers are sown in January in a span-roofed house, and a succession is maintained from April to the end of November, the only variety being Telegraph. In the Melon houses Superlative and King George are grown. They are sown in January, and ripen the first week in June."

THE RUN OF PEAS.

"When do you sow your first Peas?"

"On January 16th, and they are ready at the end of May. The variety is Carters' Six Weeks, which is a very prolific Pea. We have Peas outside from the middle of June until November."

"Do you force Strawberries largely?"

"They are grown inside and outside on a large scale, the plants being kept only for two years. I rely largely outside on my young plants for producing the best berries. The varieties grown out of doors are Royal Sovereign, Kentish Favourite, Reward, Utility, Givon's Late Prolific, and Laxton's Latest of All. The season starts with forced plants in the middle of March, and lasts until the end of July. The prolongation so far is partly due to the fact that I have a number under cloches."

"How long have you been using cloches?"

"This is the second season only, but I am well satisfied with the result. We get fruit quite three weeks before it is ripe outside. Strawberries are also grown in frames, but the cloches are a little in advance of the frames."

VIOLETS IN POTS.

"Have you any other novelties?"

"It is rather unusual to grow Violets in pots. We grow two hundred in this way, the only variety being Princess of Wales. Runners are put out in April, in the open, kept carefully watered and syringed in dry weather, lifted in the middle of September, put into a pit, kept close for a week, with air gradually admitted. When the plants have become established, the lights are removed (except when it rains) until October. Then the plants begin to flower. If desired, flowers can be produced in mid-winter, by the expedient of turning on a little fire heat."

"Have you any special varieties in your herbaceous border?"

"It is not limited to herbaceous plants, but includes bulbs in spring, and annuals in summer. Violas are grown in large batches of one colour. We carry out the principle of growing large quantities of a given colour in the herbaceous border. As you see, at the present moment, May-flowering, Darwin, and Parrot Tulips, all of very rich colour, are largely represented. Generally speaking, we work very largely in the herbaceous border on the blue and mauve shades. Very little yellow is tolerated, and we are careful not to let it predominate."

"What is the variety of Pansy, which you grow in quantity in front of the Peach case?"

"Admiration; at least, that is the variety in three rows, and the lighter shade in the row behind is Lord Beaconsfield. In another border, we grow a large number of Pansies mixed. Then there are Sweet Peas, as to which we adopt the modern system of disbudding, which gives on the average four flowers to a spike. The earliest are sown in September, and are now just beginning to show flower. We plant out eighteen inches apart. A wire is strained to two strong uprights, on which Pea sticks are tied, two growths being taken up from each plant, and tied to Pea sticks, all side growth being removed. Or the Peas can be trained along Bamboo canes. The varieties include Countess Spencer, Charles Foster, Mrs. A. Ireland, The King, Thomas Stevenson, Apple Blossom, Evelyn Hemus, Gladys Unwin, Elsie Herbert, and Helen Lewis."

"There are many questions I should like to ask, but as I cannot hope to exhaust the resources of Highclere, please tell me your previous experience before you took charge of these gardens?"

"For thirteen years I was general foreman at Wokefield Park, Mortimer. Previously I was with the late Colonel North, at Eltham, and two years with Sir Charles Seely at Brooke, Isle of Wight."

ALFRED WILCOX.

CHRYSANTHEMUMS IN JUNE.

DISAPPOINTMENTS with Chrysanthemums often result through inattention to them during June. How often, for example, does one find, after being at all the trouble to get plants into their final pots, that through neglect of staking them at the time, promising young shoots are broken off, either by rough winds, or through birds alighting on the growing soft shoots, presumably in search of insects? The sparrow seems the worst offender in this, often scratching the soil about the surface, and doing damage to the younger leaves. It is well, therefore, to place the stakes in the large pots at the time the shift is made, as if this is done the roots are less disturbed than if the stakes are inserted at a later period.

The summer position should, of course, be one where the plants will get plenty of sun.

GERSHOM.

is no chance of the spray reaching a painted surface. The solution is excellent for such plants as Hollyhocks, though, of course, only as a preventive measure, and not as a cure, for the fungus which causes the disease develops inside the tissues.

Libocedrus decurrens.

July 25th.—In Windsor Park, near Frogmore Cottage, there is a magnificent specimen of Libocedrus decurrens, often called Thuja gigantea. It was planted fifty-one years ago, and must be now quite sixty feet in height. In California it sometimes attains a height of a hundred and forty feet, but, of course, does not approach that in England. As it is not mentioned by Loudon, I suppose it had not been introduced in his time. Rose calls it "a fine species for grouping with Spruce and Fir," but, as they would tend to dwarf it, it would surely look best when standing alone, as it does at Frogmore. H. C. DAVIDSON.

The Gardens of Bushey House, Bushey, Hertfordshire.

INTERVIEW WITH MR. C. G. BLAKE, A.R.H.S.

SINCE Mr. E. H. Cuthbertson became the owner of Bushey House, eight years ago, both the mansion and the gardens have been greatly enlarged and extended. The mansion is in an elevated position, approached from the main road by a charming drive, and the gardens, which I visited in June, by the courtesy of Mr. Cuthbertson, are of a very varied and attractive character. The head gardener, Mr. C. G. Blake, under whose auspices the extensions and improvements in the gardens have been made, many of them being initiated by him, took me round on a lovely afternoon, when the brilliant sunshine augmented the beauty of the surroundings. The pleasure grounds slope from the mansion to an ornamental lake, and the prospect from the terrace is singularly picturesque. On the mansion are fine pieces of Aristolochia, Jasminum, and Pyrus japonica, while in front are hanging baskets, containing Fuchsias, Geraniums, Tradescantias, and Monardas. On the terrace were four tubs filled with Agapanthus, and a number of Bays.

"The Bays," said Mr. Blake, "we winter in a large house, and bring out at the end of April; also, at the same time, the Pomegranate. While we are standing here, I may say that the pyramids of Ivy-leaved Geraniums (Souvenir de Charles Turner) have three hundred plants to each, while the Rhododendrons, planted on the top of the slope in the park, provide at different times a show of colour which is rather pleasing."

Clarkias for the Winter Garden.

"Is the large glass building, which seems to form part of the mansion, a conservatory or winter garden?"

"A winter garden, and it connects the billiard-room with the gymnasium and ball-room. Among the plants in flower just now are a number of double salmon Clarkias."

"When did you sow them?"

"Early in the spring. They were grown on in the greenhouse, and pricked off, four or five in a 32-in. pot. I also sow a batch of Clarkias in the autumn, and these flower about March. They go on blooming for several weeks, and the shade of colour is very pretty."

"You have also a nice show of pink Spiræas."

"They are the new variety—Queen Alexandra. A cold house and perfectly natural treatment suits them best. The herbaceous Calceolarias, of which you see a number, need very careful treatment, and must not on any account be over-watered. I keep them growing, and do not let them get starved in small pots. They are Sutton's strain, some of them with lovely pips, and one plant is nearly three feet high, with a quantity of blooms."

"Do you grow your Cornflowers from seed?"

"Yes, and I have four plants in a pot, giving them greenhouse treatment. We are always glad to get the flowers. The Sweet Peas here were sown in spring, and grown on in a cold house. As to the Fuchsias in pots, the cuttings were struck in the autumn, and kept going all the winter. The varieties are Rose of Castile and The Doctor."

A VIEW IN THE ROCK GARDENS AT BUSHEY HOUSE.

The Terrace Bedding.

"What is the design of the terrace bedding?"

"Italian. There are two beds of scarlet Begonias, of which we have propagated a number, edged with Echeveria secunda glauca; two of Celosias, yellow and red; two of Fuchsias (Rose of Castile), carpeted with Petunias, and edged with Ageratums; two of Coleus Verschaffeldtii, dotted with Abutilon vexillarium, and edged with yellow Alternantheras; two of Geraniums Henry Jacoby (scarlet), edged with white Alyssums; and a centre bed of Geraniums Henry Jacoby (the golden variety), edged with Lobelias Lady Audrey Campbell (blue and white), which suits the golden Geraniums better than the blue. The wall behind is covered with Ivy, and the ten vases on the terrace walk are filled with Ivy-leaf Geranium Souvenir de Charles Turner."

"Then there are the other beds?" I rejoined, as we paused at a pretty little summer-house at the end of the terrace."

"The bed in a recess is a mixture of Pæonies and Phlox, the latter just coming on. Of the remaining beds, one contains Coleus Verschaffeldtii, and Geraniums Harry Hieover, another Iresines Lindenii and Heliotropes Lord Roberts, interspersed with Geraniums Madame Crousse; three beds are filled with Begonias Worthiana and white Alyssums—scarlet and white, again; two with Geraniums Mrs. Pollock, and Ageratums; one with Heliotropes Lord Roberts, carpeted with Portulaca, pink and white, grown from seed; two with Iresines, carpeted with white Violas, edged with Echeverias; and two with Geraniums Black Douglas, edged with Lobelias Lady Audrey Campbell; while the large centre bed, raised, is made up of Verbenas erinoides, and erinoides alba (mauve and white), dotted with Calceolarias Burbidgii. The Verbenas become

a mass of colour, covering the ground, and the effect is heightened by the ring of Ivy round the bed, two feet high."

The Best Roses.

"What sections of Roses are represented in the long border behind?"

"Teas and Hybrid Teas. Roses are a great feature in the gardens. A big bed on the lawns is made up of standards, and dwarfs

MR C. G. BLAKE.

underneath. Rosa rugosa alba, a very old plant, makes a fine show in another; and further, Alberic Barbier, a standard Wichuriana Rose, is doing splendidly. Jersey Beauty and Gardenia also make fine standards. The same may be said of Caroline Testout, and La Tosca, a magnificent autumn-flowering Rose, similar in colour to Viscountess Folkestone."

"Do you grow many other varieties on the lawns?"

"The principal of the others are Mrs. J. W. Grant, Viscountess Folkestone (the earliest of the Hybrid Teas this year), Madame A. Chatenay, Souvenir de President Carnot, Princess Augusta Victoria, Madame Ravary, Madame P. Ducher, Marie van Houtte, Lady Battersea, Mrs. S. Crawford (the best for cutting), Mrs. J. Laing, Duke of Wellington, Ulrich Brunner, Captain Hayward, Rev. Alan Cheales, and Heinrich Schultheis."

"You go in largely for Rhododendrons and mollis and Ghent Azaleas?"

"Yes. The former are mainly seedlings, but the named varieties include Pink Pearl, Lady Eleanor Cathcart, Cynthia, Kate Waterer, and John Waterer. As the soil is cold clay, we have to make it for the Rhododendrons. We put in a little peat, give a fair quantity of top spit from an old meadow, and afterwards top-dress each of them with a good coating of peat-moss litter from the horse-boxes."

"When were your rock and water gardens made?"

"They were commenced in September, 1903, on the site of a flat field. Messrs. Pulham designed the stonework, and I am responsible for the remainder, including the banks, which were thrown up and planted with flowering trees and shrubs. I had a big staff to help me, but the work occupied an entire winter. At the entrance, near the mansion and the terrace bedding, are planted many hardy British Ferns. It being very shady here, they do well."

"So, apparently, does the large specimen of Aralia Sieboldi."

"It has been growing outside for four winters. Here are the names of some of the other shrubs: — Amorpha canescens, Amelanchier candia, Andromedas (formosa, japonica, and speciosa), Bamboos, Arundinaria Veitchii, A. Simonii (this variety is, unfortunately, flowering this season), A. auricoma, A. Hindsii graminea, Phyllostachys violescens, P. nigra, Cæsalpina japonica (this has not flowered yet), Choisya ternata (this has stood without any protection during the last two winters), Cornuses in variety, Escallonia Phillipiana (a very pretty shrub, with white flowers, just coming out), Exochorda grandiflora, Erica carnea, E. alba cinera, Chamæropsis excelsa, Gaultheria Shallon, Hamamelis arborea (one of the first things to flower in the new year), Hamamelis mollis, Halesia, tetraptera, Hymenanthera crassifolia, Magnolias in variety, Spiræa Thunbergi (white, a pretty little shrub), Spiræa Anthony Waterer (which is cut down every year), Tamarix, Weigelas of sorts, Clethra alnifolia, Garrya elliptica, and Citrus trifolius (not often seen, and the only hardy variety of Orange in this country, as far as I know)."

Plants in the Rock Garden.

"I should also like to have the names of some of the plants that do best in these gardens."

"Androsace carnea, lanuginosa, sarmentosa, Aubrietias Fire King (a good variety), Cheiranthus alpinus, C. mutabilis, Dianthus, Drabas, Epilobiums, Erinus alpinus, Funkias in variety (near the edge of the water), Genista sagittalis, Herniaria glabra, Heuchera, Hutchinsia alpina, Iris, Lithospermum, Alpine Phloxes, Saponaria ocymoides, Saxifrages in great variety, and in a shady corner is Ramondia pyrenaica in flower —a pretty blue."

"Please mention any others that are notable."

"Caragaria jubata has a Pea-shaped flower, flesh colour. The leaves begin to die off after the plants have flowered, and the contrast between the green leaves and the dead is very striking. Another variety is C. pendula, a flower of the same shape, but yellow. A pretty scarlet Helianthus is Mrs. C. W. Earle, and Gypsophila repens does well. On the banks opposite I put in some Rice about a fortnight ago. It was sown in pots standing in pans of water, hardened off, and planted where it is. This is my first attempt at growing Rice."

Crossing the stream by a stone bridge, I noticed some Royal Ferns enjoying the shade and moisture, while in the top of the bridge were many varieties of Sedums planted in pockets. I inquired the names.

"The best varieties," replied Mr. Blake, "are album, Ewersi, E. turkestanicum, stoloniferum alba, rupestris grandiflorum, Middendorfianum, brevifolium, roseum, pulchellum, anglicum, obtusatum, oppositifolia splendens, and anacampseros. Then there are Sempervivum glaucum, arvenense, Fauconnetii, reginæ amaliæ, Boulignyanum, Rozeni, Verlote, arachnoideum Laggeri, fimbriatum, and tectorum. Amongst other plants are Dianthus corsicus and cœsius, Androsaces sempervoides, sarmentosa, carnea, villosa, and lanuginosa."

"You have a varied collection of bog plants?"

"Amongst the more noticeable of these are Pontederia cordata, Sagittaria japonica, and the fl. pl. variety, syphilatifolia, villarsia, and Nymphæoides, Glycera aqualicæ, Menyanthes trifolia, Mimulus, Myosotis palustris, Butomnus umbellatus, Calla palustris, and Ranunculus."

Saxifrages for Table Use.

"I see that the Dropmore Anchusas flower well."

"Yes, they like the soil, and so do the Aubrietias grown underneath. Arums, which are coming on strongly, flowered well last year. Amongst other plants in flower are Alpine Wallflowers, Citrus trifolia, Plumbago carpenteria (between the chinks of the stone), Papaver orientalis, Calycanthus floridus, Genista sagittalis, Draba aizoides, and Gentiana verna. We have several varieties of Saxifrage, and we use a considerable quantity of S. pyramidalis in pots, for house work. They want careful treatment. After flowering, we pot up the small plants, and then grow them on for one season. We flower them in 'forty-eight' pots, and they throw up immense spikes of flower, which we cut for the table. These gardens are flanked with La France Roses, and at the corner of the far entrance you see there is a bed of succulents which have just been put out."

ONE OF THE LAWNS AT BUSHEY HOUSE.

"How is the bed made up?"

"Chiefly of Aloes in variety, with Yucca gloriosa behind. The latter was transplanted from the top part of the garden, and has since flowered several times. In the bed are also several varieties of Mesembryanthemums."

"On the other side of the lake I observe you have Roses in the shape of bell tents."

"They are planted with Climbing Pèrle des Jardins, Alister Stella Gray, Noella Nabonnand, The Garland, Crimson Rambler, Félicité Perpétue, Flora, Carmine Pillar, Madame Pierre Cochet, Belle Siebrecht, The Lion, Bennett's Seedling, splendens, Leuchtstern, Dorothy Perkins, Aimée Vibert, and Gardenia."

"When did you build the terrace wall which divides the lawns, with steps on either side?"

"Four years ago. The wall stands on the site of a grass bank, and a considerable amount of levelling was needed to bring it into line with the new work. As the new wall was an eyesore to the tennis courts, I planted them with choice evergreen flowering shrubs, including Azara microphylla, Abutilon vitifolium, Cotoneaster pannax, Pyracantha angustifolia, Cistus ladaniferus, C. purpureus, C. crispus, Escallonias Langleyensis (a beautiful pink flower), Ingrami, illinita, and Exoniensis, Euonymus, Carpenteria californica (this flowers well), Ceanothus Marie Simon, C. Veitchianus, C. integrinus, Gloire de Marseilles, Camellias, and Grevillea rosmarinifolia, which latter needs protection in winter. On one side of the tennis courts are the aviaries, containing a variety of birds, and growing up the stem of a tall standard Rhododendron is Tropæolum speciosum. Near this is a tree of Davidia involucrata, and opposite the latter is the quaint tea-house."

"Is there a continual stream of water rushing from the mouths of the three frogs on the side of the lake?"

"Yes, it does not cease to flow into the lake. By the side of the latter are some fine specimens of Gunneras, and a bed of Japanese Iris. Then there are the headlands, planted in one instance with Pentstemons (Mr. Gleeson's new hybrid), edged with Cerastiums. Another headland is planted with Lobelia cardinalis and Veronica Andersonii, a third with Pyrus japonica, and a fourth with Begonias Worthiana, Cerastiums, and Aubrietias."

"On the walk at the other side of the lake the Acers seem to flourish well."

"So do the Vitis in variety, and Clematis, especially the new variety, montana rubens. The standard Roses behind these shrubs include Konigen Carola (a fine pink), Mrs. Paul, and Jules Margottin. Amongst the Roses opposite are Sunset, Mrs. John Laing, and Reynolds Hole; and the bank behind is made up of Roses, including Dean Hole (a grand variety), Phlox in clumps of one colour (the varieties being L'Embarrasment, Favourite, La Soleil, and Coquelicot), and Delphiniums Violet Beauty."

A WALK IN THE GARDENS AT BUSHEY HOUSE.
(This walk and its surroundings formed part of an ordinary field five years ago.)

Passing a pond, with a number of old stumps covered with Roses (Penzance Briers), and a bed of Iris, dotted with snowy Mespilus and small plants of Liquidambars, we came to one of the most striking features of the gardens, consisting of fourteen Rose arches, with Golden Privet on one side and common Privet on the other.

"On these arches," said Mr. Blake, "are planted Crimson Rambler, Madame J. Gravereux, Madame Alfred Carriére, Mrs. W. J. Grant, Caroline Testout, Francisca Kruger, Aglaia, and Dorothy Perkins. The Roses planted as standards and bushes, which you see near the arches, are planted in varieties of twenty-five each. Now, before we go into the houses, I should like to introduce you to our reserve garden, on the other side of the park, which was formerly occupied as a separate tenancy. We call it Rising Holme."

"You must find it a most useful addition?"

"One of the most valuable features is the range of heated pits, some fifty-six feet long. During the winter and early spring these are used for growing several thousands of bedding plants. Cinerarias do remarkably well when stood on the cool ashbed, and Roses forced in these pits, thrive; also Pelargoniums are grown here in large numbers. I fill one of the pits with Tomatoes, and another with a second crop of Melons, following on as they get empty with more Melons. Here, too, are our hotbed frames for early Potatoes, and Carrots, Radishes, Lettuce, etc. After the Potatoes are ready, I put in Marrows, and take the frames away as soon as the latter are safe from frost."

"Do you grow Violets here?"

"Yes, and I find the most successful plan is to plant them in their permanent quarters as soon as they have done flowering, and grow them on during the summer, syringing and watering. In September I put the frames on, keeping the lights off until the very wet weather and frosts set in. All our forced plants are brought to Rising Holme, are planted out after being carefully hardened off, and are given two seasons' growth; then they are fit to take up and force again, and make fine plants, as you see. For example, Prunus Pissardi, Lilacs, Laburnums, Wistarias, Stapelias, and Azaleas are treated in this way. Where you see the iron fence, there used to be a very old hedge, which I grubbed up one winter, putting the fence in its place. Having planted some young Gooseberries against it, I cut back all the branches I could not tie in, and they have surpassed my expectations. Last season the crop was enormous, and, grown in this way, Gooseberries do not take up much room. It is easy to net them, and protect the ripe fruit. The variety is Whinham's Industry. The Apple and Plum trees here bear well, and in this quarter are nursery beds containing the plants for spring bedding, such as Wallflowers, Canterbury Bells, and Pansies. These we cut when they are in bloom, to save robbing the other garden too much."

Carnations and Celosias.

Returning to the main garden, we explored the houses, starting with a cool Peach house, which also contained Plums in pots and a number of bedding plants. In the Melon house, Sutton's Ringleader is the chief variety grown, and in other plant houses are Calanthes in variety, Crotons, Ixoras, and Nerines, which are largely grown.

"What are your varieties of Caladiums?" I asked.

"Raoul Pugno, Ramond Lemonier, J. H. Laing, Haageana, candidum sanctonianthon, Marquis de Camden, John Peed, Comte de Germiny, Blue Major, and Rose Laing. These are used for house decoration during July and August. Winter-flowering Carnations are largely grown. The varieties include Enchantress (the best of them all), Flamingo, Mrs. T. W. Lawson, Mrs. S. J. Brooks, Mrs. Patten, Floriana, Madame Melba, and Royalty. The Malmaison varieties are Princess of Wales, Blush White, Calypso, Prime Minister, Maggie Hodgson, Lady Rose, Princess May, Mrs. Martin Smith, Miss Measures, Mrs. E. Hambro, Mrs. Trelawney, and H. J. Jones."

"Then you grow a number of Celosias?"

"They are chiefly coccinea aurea. I like to grow them in an intermediate house, and do not give them a check until they are well out, and then I carefully harden them off before bedding them."

"With regard to fruit grown inside, what are your varieties of Grapes?"

"Black Hamburgh (which, you see, are ripe), Muscat of Alexandria, Black Alicante, Lady Downe's Seedling, Mrs. Pince, and Gros Colmar."

"And Peaches?"

"You have seen the cold house. The varieties grown in heated houses are Grosse Mignonne, Sea Eagle, Crimson Galande, Royal George, Walburton Admirable, Noblesse, Dymond, Peregrine (one of Rivers' new varieties), and a very nice flavour), and Duchess of Cornwall. The Nectarines are Rivers' Early Orange, Cardinal, Early Rivers, Elruge, Pineapple, and Precoce de Croncels."

"Do you have good crops of Figs?"

"We gathered a nice quantity at the beginning of June, and shall have a second crop. Figs require very little attention, and not much water. After they have made about five or six leaves, the leading shoot should be pinched, to steady the growth, and then we get plenty of fruit."

A Rare Specimen Plant.

"In your little flowering house you have a remarkable specimen in a pot, which I do not recognise."

"I believe it is very rare. It is called Beaucarnea recurvata, and was as big as this seven years ago; its age must be very great. On the wall of this house, Heliotrope blooms all the year round. I cut it back hard in the early spring, and then it starts away into growth, and keeps on flowering. One of the stove houses is filled with this year's seedling Gloxinias (Sutton's and Peed's strains). We use them as specimen plants in vases during the season. The treatment is just the ordinary. I like to keep them fairly warm, and to thoroughly ripen the bulbs. After they have flowered twice, I throw them away. The next house I use for herbaceous Calceolarias in the winter, and, when cleared out, for Caladiums, Poinsettias, etc."

Fruit in the Kitchen Garden.

"Now, there remains the kitchen garden?"

"As you see, it is divided into four quarters, with a fine Holly hedge on the west side. In the centre of the hedge is a cut Yew archway. I find the top quarter to be the earliest, and keep it for first crops of Potatoes, Strawberries, Peas, and Cabbages. On this quarter, Spinach and Broccoli stand the winter best. The next two quarters are used in rotation for Onions, Carrots, Beets, Peas, Celery, Cabbages, and late batches of Strawberries."

"What are your varieties of Strawberries?"

"Royal Sovereign and Laxton's Fillbasket. The latter is a grand cropper, and comes in as soon as the former is over. The bottom quarter of the garden is reserved for bush fruit, and was covered with wire netting about eighteen months ago, and last year it proved a great economy by keeping the birds away from the fruit. When the fruit is ripe, I have a large panel put up, but at other times the birds have free access. Below this is the orchard, where I have put in some new fruit trees, in place of others which were worn out."

"How are Apples chiefly grown in the kitchen garden?"

"As pyramids, on the Paradise stock. The Apples include Cox's Orange Pippin, Allington Pippin, Peasgood's Nonsuch, Ribston Pippin, Duchess of Oldenburgh, Worcester Pearmain, Newton Wonder, Royal Jubilee, Stirling Castle, Lane's Prince Albert, and Bismarck. Pears, as well as Apples, are grown as cordons, and do well, especially Williams's Bon Chrétien, Beurré Diel, Jargonelle, Marie Louise, Doyenné du Comice, Bergamotte, and Knight's Monarch. Plums are again carrying heavy crops. The borders here are used for supplying cut flowers for the mansion, and are planted yearly with large batches of bulbs, such as Spanish and English Iris, and The Bride Gladiolus. These I cover with a good coating of wood ashes after they are planted; it helps to keep them warm through the winter."

How to Get Early Potatoes.

"Would you like to add anything about vegetables?"

"I find Chelsea Gem the best early Pea. It is followed in a few days by Sutton's Early Giant, of which I make several sowings. Then comes Autocrat, also a very good variety. The best early Potato is Ninetyfold, which quickly gets to a good size, and is very white when cooked. I always lay the sets up, to sprout, before planting, and I do not like to plant too soon, as our ground is cold. If the Potatoes are well sprouted, and planted about the end of April, they are up in two or three weeks, and sooner than that they would not be safe from spring frosts."

"Where did you start your gardening career, Mr. Blake?"

"I am a native of Cornwall, and began gardening under my father, who was a successful exhibitor at county shows. I then went to Bowden Hall, near Gloucester, under Mr. Keen, to whom I am indebted for much that I have learnt. He was a pupil of Frost, of Dropmore—a name very prominent forty years ago. At the end of three years I went to Messrs. Veitch's Royal Exotic Nurseries, and was subsequently sent by them to Monk's Orchard, Surrey. After that I spent three months in the stove houses at Chelsea, and I then took the foreman's place at Monk's Orchard. I stayed there for eighteen months, and then went to Charlton House, Kent, as foreman, where I remained for three years and a half. On the death of Sir Spencer Maryon Wilson, I succeeded Mr. Gilbert as head gardener, and stayed at Charlton three years and a half longer, in that capacity. Seven years ago I was engaged by Mr. Cuthbertson as head gardener here, and you have seen many of the improvements which, under his guidance, I have been able to carry out. Mr. and Mrs. Cuthbertson take the greatest interest in their gardens."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 313.—CARNATIONS.

Dear Kate,—The Carnations are now in full beauty, and few flowers can rival their brilliant tints. King Solomon (of which I wrote to you last year), and Basuto are both rather early in opening their buds,

Malmaison Carnations—Mercia.

and they are both magnificent in crimson-velvet (slashed with apricot in the case of Basuto), of perfect form, and good size. In Shakespeare's time, we read in the "Winter's Tale," "The fairest flowers of the season are our Carnations and streaked Gilliflowers," and still they come, more exquisite and dainty than ever. I was asked the other day to explain the difference between a Pink and a Carnation. They are both members of the same Order (Caryophyllaceæ), but belong to different genera, the Carnations all coming from Dianthus caryophyllus, whilst the Pinks belong to Dianthus plumarius. The petals of Pinks are narrow, and more or less "pinked," whilst those of the Carnation are broader, and should not be serrated, though in America those which have cut edges are, I believe, preferred. The growth of the Pink is far more tufted, and the height of both flower-stem and foliage lower than that of the Carnation, and the Pink blooms earlier than the Carnations; but, when all these differences are enumerated, it is still a little difficult to make sure to which group they belong, sometimes, and I think that there have been hybrids between the two. The plants of this Order can be hybridised in some instances. One of the best of our newer herbaceous plants is Dianthus Lady Dixon, a hybrid between a fine Clove Carnation and a Sweet William (Dianthus barbatus); it has foliage which is greener than that of the Carnation, and produces tufts of handsome double blossoms, as large as an ordinary Carnation, in bright crimson—altogether a most desirable plant.

Carnation Classification.

But to return to the Carnations after this long digression. They are, of course, divided into several sections; for the Malmaisons (of which the origin still appears to be obscure, although they were first recognised as a distinct group in Marie Antoinette's favourite garden), the winter-flowering Carnations, and the Border Carnations are different in some particulars, yet all are so mixed up by hybrids that they are not easily classified; whilst the colours, again, are grouped under the heads of Selfs, Fancies, Yellow-ground Picotees, and White-ground Picotees. The Self Carnation is, of course, of one colour only; the Fancy varieties display two or three streaks or blotches, whilst the Picotees have white or yellow petals, more or less broadly edged with a distinct tint, usually some shade of red, from pink to maroon.

All the Carnation tribe will do well in a city garden, if cats and wireworms can be kept away from the borders. They seem to enjoy soot in every form. They are also excellent plants to grow in a cold glass porch, or a greenhouse without hot-water pipes, but in such a case an abundance of air and sunshine are necessary to prevent mildew in winter, and a good lamp should be placed on the floor at night, in severe weather, both to dry the air and prevent the soil in the pots from freezing, for plants in pots suffer more from this cause than in the open border, their roots being more exposed to the frost. Pot Carnations blossom a month earlier than those in the garden, and the blooms are more easily protected from rainstorms, so that those who exhibit these flowers usually grow their finest flowers under glass in winter, though they should stand out of doors in the full sunshine during the summer; but plenty of air is needed for them all the year round,

H.W. Blake

THE GARDENS OF THE EARL OF ONSLOW, AT CLANDON PARK, GUILDFORD

DURING the lifetime of the late Earl of Onslow, after his retirement from the Governorship of New Zealand, many important changes and developments were made in the always beautiful gardens at Clandon Park. Under the auspices of his son, the present peer, and of Lady Onslow, the care and attention given to them in the past are not likely to be abated. I am indebted to the courtesy of Lord Onslow for the opportunity of describing the principal features of his pleasure grounds, which for variety and taste, cannot easily be surpassed. They are in charge of Mr. H. W. Blake, who, on a brilliant summer afternoon, did his utmost, in a limited period of time, to show me all their charms. It was convenient to begin our tour with one of the recent additions, the Dutch, or sunk garden, which is adjacent to one of the approaches to the mansion.

The Dutch Garden.

"When was this made?" I enquired, as we surveyed a glowing expanse of flowers of many colours, gaining in impressiveness by the excellent fulfilment of a clever design.

"About ten years ago. The late Lord Onslow designed it on the lines of the Dutch garden at Hampton Court. The decorative parts include the topiary work, trained Yews, and numerous Japanese shrubs. Eremurus in variety, from five to six feet high, are prominent. All the soil was imported, and below it are two feet six inches of gravel."

"Speaking of embellishments, the Sweet Williams at the far end of the garden make a fine show, which is accentuated by the rise of the slope, the rustic seat, and the magnificent Oak overshadowing it."

"When Lord Onslow selected the site, he was mindful of the Oak. The latter is seen at its best from the Japanese lantern at the other end of the pergola, through which the Dutch garden is approached from the house. The more conspicuous contents include Lychnis chalcedonica and viscaria splendens flore pleno; Œnothera Youngii; Chrysanthemums maximum and King Edward; Rudbeckia Newmanii; Michaelmas Daisies in about a dozen varieties; two varieties of Dictamnus; Echinopsis; Achilleas, Eupatoriums, Heuchera sanguinea; Asclepia tuberosa; Bocconia cordata; Anchusa Dropmore variety; Sidalcea canadensis; and Trollius Phœnix. The principal annuals, in addition to the Sweet Williams are Dianthus, Stocks, Clarkias, Antirrhinums, Poppies, Ornagalis, Linums, and Mignonette. Pink is a favourite colour."

"Before we proceed through the pergola," continued Mr. Blake, "you may like to take note of what we call the Bulb Park, a piece of ground formerly also outside the pleasure gardens, in which there are planted upwards of four hundred thousand bulbs. The first to flower in spring are the Crocuses, then the Narcissi, next the Darwin Tulips, and finally the English and Spanish Irises, with Oriental Poppies in patches. They all come up in the grass, and some of the Irises look like gigantic butterflies. Then there are big beds of flowering shrubs, such as Crabs, Prunus, and clumps of Crimson Rambler and Carmine Pillar Roses. This was done piecemeal, the fence being often moved for purposes of enlargement."

CRINUMS IN CLANDON PARK.

CLANDON PARK, GUILDFORD.

"There are striking specimens of Wistarias on the left of the pergola."

"They were imported from Japan, and there are three varieties represented. The flower stalks of W. multijuga give masses of bloom—they were better than ever this year. The only drawback to the variety is that it drops its flowers. The tub of W. multijuga in the centre of the Wistaria bower heightens the effect. We find that the plants imported from Japan have more strength, and the foliage more splendour, than any English-grown plants. The soil is all made, and embraces loam, leaf-mould, and cow manure. Every other year we mulch heavily with cow manure."

"I conclude that you had to make the soil for the Rose pergola?"

"Three feet of it. The pergola, like the sunk garden, and the bulb ground, was taken out of the park, fifteen years ago. The design was obtained by Lord Onslow during a visit to Italy. The pergola is about a hundred and fifty yards long, and is dotted with all the best varieties of climbing Roses; Aristolochias, Clematis in variety, Polygonums, Honeysuckle (Dutch and Japanese), Jasminums, Wistarias, Virginia Creepers, and Laburnums. All the finest Wichurianas are represented amongst the Roses, notably Lady Gay, Dorothy Perkins, and Reine Andre—a most beautiful Rose for table decoration on a white cloth. One of the best of the singles is Leuchtstern; it remains in flower for a fortnight, an unusually long time for a single. In conjunction with Aimée Vibert, it makes an admirable table decoration. The growth of Alister Stella Gray is tremendous. We cut out old wood every year, and tie in young wood."

Japanese Acers.

"Now we come to a magnificent stretch of colour on the expansive lawn—I mean the big bed of Japanese Maples."

"That bed has been described as the finest bit of colour of its kind in the county. All the contents were imported from Japan. The principal is sanguineum, with its many varieties, including A. dissectum, the drooping form. The bed is edged with dwarf-growing varieties, such as A. Chiso and A. Seigen. I do not know which is admired more, the deep bronze in the autumn, or the deep crimson in the summer."

"Are there any special points to be observed in cultivation or position?"

"As to position, you will notice that the Acers are well protected from north and east winds, and at the same time fully exposed to the sun. There is not much to be said as to cultivation. Acers do equally well in heavy or chalky soil. Nor are they injured by lifting. All these were lifted twelve months ago last autumn, and came out as clean-rooted as possible. At the same time, great care is necessary in the process of lifting. Almost opposite the Acers is the collection of New Zealand Tree Ferns sent by Mr. Seddon to Lord Onslow."

"They appear to be flourishing exceedingly."

"The shade suits them. We put them out at the end of May, and take them in when the

Digitized by Google Original from CORNELL UNIVERSITY

frosts begin. We keep them well syringed, and their growth has been wonderful. The varieties are Dicksonia antarctica and squarrosa; Cythia dealbata and Urechilari. In this part of the lawn there are several specimen Japanese Acers, an avenue of Cupressus Lawsoniana growing in chalk, with a number of Italian vases containing Geraniums Madame Crousse. Here, too, is the Warwick vase, or a copy of it. It is in a sheltered position under a Beech tree, and close to a Yew on the edge of the wilderness."

The Aromatic Garden.

"How do you describe the bedding in front of the house?"

"We call it the Aromatic garden. No spring bedding is done in this garden, because it would not be policy to lift or shift Roses or Lavender, which are a great feature in summer. Practically only the beds containing Anchusas would lend themselves to this treatment. They are made up of Veronicas, amethystena and King of the Blues; Salvia patens, Clematis integrifolia, Anchusa Dropmore variety, of which we have a very great show; Echinopsis Rito; Campanula carpatica; Gentiana verna; Campanula grandiflora; Hepatica cœrulea; Aster Bernice; Ajuga reptans; Geraniums grandiflorum; and Delphiniums in variety."

"The idea," continued Mr. Blake, "is to combine fragrance with a mass of lovely colour. The beds on each side are filled with Tea Roses and Heliotropes, edged with Sweet Brier Roses. Recently imported from Venice, the marble well-head makes a splendid centre for the beds. There is a good show of blooms in these beds until the end of September. Each year we mix a certain amount of new soil with the old. The north side of the mansion, which was built in 1735, is severely plain, but it faces the noble Cranley avenue of Copper and Green Beeches."

A short distance from the house is a flight of steps, and at the foot Bamboos, imported from Italy, are growing on the top of a spring head.

"Bamboos," observed Mr. Blake, "require as tender care as Maples. The wind, which is so destructive, cannot reach them here; we do not tie them too severely, as when snow falls they go down under the weight of it, if tied before they very often break away. They are always kept moist. Some of them make a growth of fifteen feet in a year. One of the best is palmata, but anceps, japonica, quadrangularis, aurea, nitis, and nigra, all find the situation and the conditions of cultivation satisfactory. The next feature on the way to the Maori House is the Iris border; or I should say borders, wet and dry. The former consists of Japanese Iris, including Kæmpferi of the best class, and other imported varieties. This border is one hundred and fifty yards long, but the dry border is two hundred and fifty yards long and twelve feet wide. Here the varieties include Victorine, Rigoletti, asiatica, Queen of May, Madame Chereau, Maori King, Purple King, Oriflamme, Monsignor, Cyprina, pallida, dalmatica, Prosper, Langier, Edouard Michael, Mrs. Newbonner, and Comte de St. Clair. The Iris season begins after the Narcissi have done flowering, and lasts until the end of July, covering the whole of the banks on one side of the extensive ornamental water. English and Spanish Irises are also represented. They are backed with a hedge of Golden Privet, with which is interspersed Spiræa gigantea. On the opposite bank of the water, is the Lily border, eighty yards long. Here are beds of Azalea mollis, with Tamarisks, Spiræas, and Privet behind."

THE AROMATIC GARDEN AT CLANDON PARK.

THE MAPLE BED AT CLANDON PARK.

"You might mention the names of the rarest and best of the Japanese Iris?"

"The lævigata type include Monnieri, Monspur, ochroleuca and o. aurea, Shelford Giant, Dorothy Foster, Toll Long, and Tollmeana. Dorothy Foster was, of course, one of the late Sir Michael's varieties, of which we have several. Passing the Japanese Temple at the end of the Iris walk, we reach the Primula Dell, but you are too late in the season to see it in flower."

The Primula Dell.

"You might tell me something about the varieties?"

"Primula denticulum grows two feet high, with flowers as big as a tennis ball. P. Bulleyana makes a very beautiful bed; and P. japonica, close to the water, thrives exceedingly. Other varieties are P. rosea, P. frondosa, and P. Veitchii, which is now flowering for the second time. All the Primulas are grown on rank clay and leaf-mould, yet they make a good holding. In this part of garden we grow a great number of seedling Polyanthus. Further on is the water garden, and on the banks of the water are Gunneras in variety, New Zealand Grass, and Astilbe Davidii. It is worth while to mention the Verbascum Olympus, which in a few weeks will be a mass of flower. They are planted three or four feet apart, and require a great quantity of manure, but they are only at home in a large space. Other features include a fine specimen of Gunnera manicata, with its toes in the water; and a very rare kind of Iris, called albo - purpureum cæruleum. In the Lily pond are Nymphæas Excelsior, gloriosa, Robinsonia, rosea, Ladyica purpurea, Ellisonia, carnea, and Marliacæa Colossus. Pæonies do magnificently in this congenial spot. Now we are in sight of the Maori House. I may say that the Iris borders and The Dell were the outcome of the erection of the Maori House."

"Is it quite unique?"

"It is, I believe, the only one of its kind in England. In summer it is pleasant for rest and the look-out is very pretty, particularly the clumps of Roses and Anchusas mixed—a combination of pink and blue which we use as much as possible. In front of the Maori House are several plants which were sent by Mr. Seddon, and are thriving in their new home. They include the New Zealand Broad-leaf, the Bottle-brush tree, Kohia sopheca, and Titora podorcorpus.

After a brief stay in the Maori House, we retraced our steps in the direction of the kitchen garden, which also contains the glasshouses.

"These," said Mr. Blake, "are not on a large

Digitized by Google Original from CORNELL UNIVERSITY

scale, and were built many years ago. In the one and only Vinery, we have Black Hamburgh, Mrs. Pearson, Madresfield Court, and Duke of Brunswick. Then there is the Melon house, with a collection of Calanthes, which are very restful to the eye. We grow about one hundred and thirty, chiefly C. Veitchii and the remainder Vestatis. About a couple of hundred Malmaison Carnations are grown, the principal varieties being Princess of Wales, Albion, and Lady Coventry, a flower with a lovely scent. The houses include a Peach house and a Fernery. The favourite Melon is Emerald Gem, and the favourite Tomatoes Duke of York and Carters' Sunrise."

"Do you grow many Chrysanthemums?"

"About two hundred, of all the leading varieties."

Outside the houses there are many objects of interest in the kitchen garden. First a Rose walk, which is really nothing less than a Rose garden, attracted my attention. I asked Mr. Blake to explain the scheme of planting.

"There are a number of Roses in beds, eighteen in each, Tall weeping Roses are planted in the centre of each bed. In making a selection of varieties, we choose as far as possible those that flower for the longest time. Originally, this Rose garden was a Potato ground, which had to be blotted out of existence, but the Yew hedge was allowed to remain. More Roses are grown in a second Rose garden.

The Stream Garden.

The vicinity of the Rose gardens, as well as the gardens themselves, is very attractive, with grass paths on each side of the long herbaceous border, and a Lily pond in the centre of an octagon of arches clothed with Roses, Laburnums, and Honeysuckles. Beyond is a blue border, consisting of Scilla italica, Campanula cœrulea, Allium azureum, Muscaria Heavenly Blue, English Iris King of Blues, Chionodoxa sardensis, and Camosia esculenta. In this garden, also, are the clumps of Sweet Peas. A few fruit trees have lately been planted at intervals in the Stream Garden, with Stocks as groundwork."

"I ought to say something about your fine show of hardy fruit," I observed.

"Apples and Pears are the chief, though all the others are grown. The best dessert Apples are Allen's Everlasting, Gladstone, Worcester Pearmain, Early Harvest, Wealthy, King of Pippins, Cox's Orange Pippin, Peasgood's Nonsuch, and D'Arcy Shiel; the best cooking varieties are Bramley's Seedling, Round Winter Nonsuch, Newton Wonder, Mere de Menage, Golden Noble, Lord Suffield, and French Crab. The collection of Pears include Jargonelle, Williams's Bon Chretien, Souvenir de Congres, Thompson, Pitmaston Duchess, Beurre Bosc, Beurre Hardy, Beurre Superfin, Doyenne du Comice, Beurre Diel, Winter Nelis, Marie Louise, and Easter Beurre."

"And vegetables?"

"Peas in succession are William I., Sutton's Improved, Early Giant, Duchess of York, May Queen, King Edward, Best of All, and Sutton's Selected Longpod. The Broad Beans are Sutton's Exhibition Longpod, and Giant Green Windsor. I use Up-to-Date for the main Potato crop, and Ashleaf and Midlothian Early for early work. With regard to the kitchen garden generally, of which there are four acres, I believe in deep cultivation, and in sowing, cleaning, and thinning at the proper time."

Mr. Blake's Career.

"How long have you been head gardener at Clandon Park?"

"Twenty-one years on August 4th. I started at Stoke Park, Guildford, and my father has been on this estate all his life. My first post away was at Gunnersbury, under Mr. Hudson, and I was next at Haydon Hall, Harrow, for three years. Then I became general foreman at Clare Lawn, when Sir Frederick Wigan was the owner, and from Clare Lawn I came here at the age of twenty-eight."

"Have you done much showing?"

"It has never been a feature here, but I have shown at Guildford and Woking, and locally we have swept the boards. For six years we were first for Grapes, Madresfield Court, at Richmond; and we have also won at Richmond for table plants, Melons, and Tomatoes."

ALFRED WILCOX.

NEXT week—Interview with the president of the Society of British Ferns: Mr. W. B. Cranfield, F.R.H.S.

ORANGE TREES IN THE GREENHOUSE.

ONE can never hope to cultivate the Orange in an ordinary greenhouse with the same degree of success as is obtained under temperate house treatment. At the same time, it is quite possible to have both green and ripe fruits, also flowers, upon the trees over at least nine months in the year, provided a few important details are attended to.

Amateurs often fall into the error of overpotting, the evil being aggravated by the collar of the plants being covered with soil, and the leaves literally smothered with dirt deposits and insect pests.

Treatment for Success.

Rational treatment consists in affording a medium of turfy loam, with a small quantity of leaf-soil, charcoal, and sand added. It is a huge mistake to incorporate rank manure.

As the trees develop and demand roomier quarters, give them pots with a 2-in. diameter in excess of those they previously occupied, the soil being solidified by ramming as the work proceeds. Efficient drainage is an important detail, and in addition to plenty of crocks, a thick layer of moss should be used.

Orange trees appreciate overhead waterings, and it should be carried out with regularity, dating from the time the main crop of fruits have set in early summer until October.

It will occur to the cultivator to suspend the operation of syringing immediately before the blossoms expand; otherwise failure to set fruits will be recorded. Atmospheric moisture during this time can be produced by damping down the floor and between the trees. When the fruits commence to swell freely, a mild form of stimulant may be given with advantage. A perfectly safe fertiliser for our purpose is found in soot.

Pruning.

A word as to pruning. All that is necessary is to stop or pinch strong growths that tend to destroy the symmetry of the trees, and to prevent anything in the shape of density throughout. Cleanliness must be observed, both the leaves and stems being cleansed from time to time with an approved insecticide.

Those who have sampled home-grown Oranges will bear me out when I say that the imported article is not to be compared with them. There is as much difference as between the ordinary white Grape of our house walls and choice Muscats of Alexandria.

Those who have sufficient glass accommodation should cultivate a small collection, preference being given to St. Michaels, Dom Louise, Excelsior, and Bittencourt. Then we have the aromatic Tangerine, Blood, Jaffa, White Orange, and Washington Navel Orange.

WALTER H. AGGETT.

THE ORANGERY AT BOWOOD.

Bowood is the country residence of the Marquis of Lansdowne.

HARDY CYCLAMEN.

FOR rockwork or planting in grass, the hardy Cyclamen are interesting, and but little grown. Their requirements are simple, consisting in perfect drainage, shelter from cutting winds in spring, and scorching sun in summer, while some lime or mortar-rubble and leaf-mould should be around the corms. Cyclamen africanum has blush flowers, with a purplish centre in autumn, and huge foliage, heart-shaped in form, with a fine silvery zone. All the corm varieties are spring flowering, and of these, too, the foliage is very prettily variegated. Europæum is sweetly scented, and flowers during August and September, with crimson blooms; it should be placed five inches deep in peat.

Digitized by Google Original from CORNELL UNIVERSITY

ignored. And the gain is great. As it is in Art, so it is in the garden, but our artists have moved faster than our gardeners.

Another Problem.

July 8th.—Some weeks ago I propounded a social problem in connection with gardening. Here is another: A nurseryman, an old man, has got what he believes to be a treasure—an Auricula with green-edged flowers. He is tending it with the greatest care, intending to propagate it by means of seed and by division, and thus raise a large stock. He thinks there is money in it, and, when it was flowering, nothing pleased him more than to invite people to come and see it. Of course, he is labouring under a delusion. As most gardeners know, green-edged Auriculas are by no means uncommon. There is a special class for them at every Auricula show. Now, what should one do? Blunt, outspoken, honest John Bull will probably answer offhand, "Why, tell the man, and save him years of disappointment." But consider! The years are really of pleasant anticipation; the disappointment, when it comes, will be, if sharp, at least comparatively brief. Why deprive him of the former? He is an old man, too, and it will take him years to get his stock; he may then not be here, and so may escape the disappointment. That is my solution, but I may be wrong.

MR. H. J. BLOXHAM.

Gerbera Jamesoni.

July 9th.—When writing about Gerbera Jamesoni over a month ago, I made a mistake. I said that the three plants which I had left in the border all winter in order to test their hardiness had been killed. Since then, one of them has been discovered, and is now doing well. As the result of the exceptionally dry spring and cold nights, it was so late in showing above ground that its death was regarded as certain. After what it has passed through, this particular plant may now fairly be called hardy—here. And in future there need be little anxiety about it. Perhaps, too, if seed be saved from it, the offspring may be still hardier than the parent. It will be a great gain if we can succeed in establishing Gerbera Jamesoni in our borders.

Grass v. Gravel Paths.

July 10th.—So far as appearances are concerned, there can be no doubt that a grass path is superior to any other kind of path in the garden. It must, however, be kept in perfect order, and that means trouble and expense, and it has the disadvantage that it is often too damp for thin shoes when a gravel path is quite dry. In consequence, a compromise is generally made—gravel for paths which must be in frequent use, and grass for paths which need not be used except for pleasure. H. C. DAVIDSON.

The Gardens at Tongswood, Hawkhurst.

INTERVIEW WITH MR. H. J. BLOXHAM.

ON Wednesday next the flower show under the auspices of the Hawkhurst Horticultural Society will be held in the pleasure grounds at Tongswood, the seat of Mr. C. E. Gunther, in the heart of some of the loveliest scenery in Kent. Apart from the attractions of the show itself, many people will doubtless gladly take advantage of the opportunity of seeing the beautiful gardens which I was able to visit during the month of June. They are the worthy setting for a very fine mansion, which has been vastly improved and extended by the present owner, and is still being further enlarged. The features of Tongswood, from a horticultural point of view, are chiefly outside. We commenced at once to pay attention to these, starting with the splendid avenue of Limes at the north entrance. In this direction there is a Pinetum, and I asked for the names of some of the Conifers which are grown.

"Abies," said Mr. Bloxham, "are represented, amongst other varieties, by excelsa, nigra, orientalis, polita, pungens, Parryana glauca, and P. pendula glauca, Smithiana, concolor, Lowiana, nobilis, Nordmanniana, pinsapo, Veitchii, Albertiana, Douglassii, and D. glauca elegans. The soil suits Abies."

"It seems to suit Cedars equally well."

"Especially C. atlantica glauca, a. aurea, Deodara robusta, and Libani. The Cupressus is another Conifer which is strongly represented. The varieties embrace C. Goveniana, Lawsoniana, C. L. Allumi, C. L. erecta viridis, C. L. filifera, C. L. lutea, C. L. Shawii, C. L. Stewartii, C. L. Triumph of Boskoop, C. L. Westermanni, C. L. Wisselii, C. macrocarpa, and C. m. lutea."

"Then, there is the family of Pines?"

"Of these, the varieties are half a score—P. austriaca, insignis, laricio, montana, ponderosa, maritima, Sabiniana, Massoniana, excelsa, and strobus. The Retinosporas are ericoides, obtusa aurea, o. Crippsii, o. Mariessii, plumosa, and squarrosa. Other Conifers include Cryptomeria japonica elegans, Juniperus canadensis, J. c. aurea, and J. chinensis alba variegata; Libocedrus decurrens, Sequoia gigantea, and

THE ROCKERY AT TONGSWOOD, HAWKHURST

Digitized by Google Original from CORNELL UNIVERSITY

sempervirens, Taxus Dovastonii, T. baccata aurea, and T. fastigiata, and Thujopsis dolobrata variegata."

Shrubs in Masses and Beds.

"Not less important than the Conifers," continued Mr. Bloxham, "are the shrubs in masses and beds, most of which were only planted four years ago."

"Which do you consider the best of the evergreen varieties?"

"Some of the best are Aucuba japonica, Berberis aquifolium, B. Darwinii, B. stenophylla, B. vulgaris, B. purpurea, and B. Thunbergii, Buxus japonica aurea, Cerasus rotundifolia and lusitanica, Choisya ternata, Cotoneaster microphylla and Simonsii, Cratægus Lælandii, Daphne cneorum, Escallonia macrantha, Euonymus ovatus aurea, Ilex Golden Queen and Silver Queen, Ligustrum aureum variegatum, Magnolia grandiflora, Olearia Haastii and nitida, Photinia Benthamiana, Skimmia fragrans, Veronica Andersonii, Viburnum tinus, and Yucca recurva."

THE ROSE GARDEN AT TONGSWOOD, HAWKHURST.

The Best Deciduous Varieties.

"Which are the chief varieties of deciduous shrubs and trees?"

"First of all, there are the Japanese Maples, of which, as you see, we have some fine beds. The other varieties include Acer negundo aureum variegatum, A. pulvatum aureum variegatum, and A. p. atropurpureum, A. dissectum, A. flavescens, A. laciniatum, A. rubrum, A. lobatum reticulatum, A. sanguineum, and A. versicolor. Alnus is represented by glutinosa aurea, Amelanchiers by canadensis, Amygdalus by Davidiana and persica flore pleno, and Buddleias by variabilis. Then we have Cerasus avium multiplex, Cytisus scoparius, and C. alba, Cornus alba Spaethi, Cratægus coccinea, etc., Deutzia Sieboldii, and S. Lemoinei, Exocnorda grandiflora, Forsythias Fortunei and viridissima, Hydrangeas hortensia, Thomas Hogg, and paniculata grandiflora, Hypericums calycinum and Moserianum, Kerrias japonica and flore pleno albo, Liquidambar styraciflua, Liriodendron tulipifera, Loniceras fragrantissima and Standishii, Magnolias stellata, Campbellii and conspicua, Philadelphus Coulterii and grandiflorus, Prunus Pissardi, spinosa, and triloba, Pyrus japonica alba, Malus alba plena and floribunda, Quercus coccinea and macrophylla, Rhus cotinus, Ribes aureum, atro-sanguineum, and others, Robinias hispida grandiflora and angustifolia elegans, Sambucus nigra and aurea, Spartium junceum, Spiræas Anthony Waterer, ariæfolia, etc., Syringas Emodi, persica alba, Dr. Lindley, Leon Simon, Emile Lemoine, and President Carnot, Tamarix parviflora and tetrandra, Viburnums opulus, placatum, and macrocephalum, and Weigelas rosea, Eva Rathke, hortensis nivea, rosea variegata, and Abel Carriere."

The Terrace Bedding.

"You have also a large number of Azaleas and Rhododendrons."

"Yes, but the Rhododendrons you will see in profusion a little later on. Near the mansion there are a few beds planted with one variety, such as John Walter. The soil is hardly suitable, being very heavy loam, but we add large quantities of peat and sand, and we also give them a good mulching of peat-moss manure in the autumn, under which treatment we find they grow successfully. Here, also, adjoining the tennis court, are a number of Roses, in beds of one variety, planted three years ago, to give masses of colour. We use a good many Ramblers, such as Alberic Barbier, for climbing over old stumps of trees."

"What are the creepers on the mansion?"

"Chiefly Wistaria sinensis, Virginia Creeper, and Roses, with Golden Yews below. Under the wall below the mansion is a border the whole length, planted with Geraniums Paul Crampel, and Salvias Pride of Zurich, alternating. On the wall behind are Cydonia Roses, which bloom in spring before the Geraniums and Salvias are in flower."

Combinations on the Lawns.

From the terrace we proceeded to the main pleasure grounds, which have a Holly hedge, carefully kept, all round them.

"Beds on the slopes are the feature here," said Mr. Bloxham.

"Are they chiefly of one variety, or in combination?"

"They vary. Here, for instance, is a bed of Golden Privet and Prunus Pissardi, and next to it is a combination of Berberis with flowering Cherries and Almonds."

"You have a number of small beds of a more formal character."

"They are specially planted for summer flowering, and are filled with Begonias Fairy Queen and Bertram, Pelargoniums H. Jacoby, King Edward VII., and Charles Turner, Schizanthus, Nemesias, and Marguerites, the edging throughout being composed of either Lobelias Kathleen Mallard or Pyrethrum Golden Feather."

"How are these beds planted for spring?"

"For spring bedding, here and elsewhere, we use mainly Wallflowers, Tulips, Hyacinths, and Polyanthus, with an edging of Myosotis and Arabis flore pleno."

"You have a large bed of Gladiolus, with a Palm in the centre."

"And dotted with Phlox Drummondi, the varieties of Gladiolus including Peach Blossom, Brenchleyensis, Salmon Queen, and Colvillei."

A Transformed Pit.

At this point Mr. Bloxham suggested that we should inspect a recent addition to the gardens, which now forms a part of the pleasure grounds. Two years ago, an old pit was cleared out, the space was filled with water, and the banks studded with shrubs, Ferns, and flowering plants. Among those in flower were numerous Rhododendrons, Anchusa italica (Dropmore variety), Rambler Roses, Magnolia, and Dielytra spectabile.

"What are the varieties of Rhododendrons that do best in a shady spot like this?"

"Mrs. Holford (salmon-pink), Lord Roberts (rosy scarlet, black spot), Marchioness of Lansdowne (pale rose, black spot), John Walter (rich crimson), Cynthia (bright rose), General Hutton (large white), and Mr. R. S. Holford (an extremely good rose colour)."

The Best Rhododendrons.

"As we are talking of Rhododendrons, you might conveniently name a few of the varieties which are grown in other parts of the gardens."

"There are literally many thousands. In addition to the varieties I have already mentioned, the principal are Ascot Brilliant (blood-red), Baron Schroder (plum-yellow centre), Charles Dickens (dark scarlet), Charles Waterer (scarlet, light centre), Duc de Brabant (yellowish-white, spotted red), Florence (pink, with white centre), James Marshall Brookes (rich scarlet), John Waterer (deep crimson), Kate Waterer (clear rose-crimson), Lady Clementina Walsh (red, edged pink), Meteor (fiery crimson), Michael Waterer (bright scarlet), Mrs. J. Wallace (white centre, crimson edge), Prince Camille de Rohan (white, shaded rose), Sylvia (rich purple), Vesuvius (crimson-scarlet), Pink Pearl, and Gloriosum (light lilac). As to other plants in this dell, Bamboos, Foxgloves, Polygonums, and several Alpines do well, and there are a few aquatics in pockets round the pond."

"I should like to know the names of the varieties of Bamboos which do best in such a situation."

"Arundinaria japonica, palmata, pumila, Simoni, auricoma, graminea, nitida, spathiflora, and aristata; Phyllostachys aurea, fastuosa, flexuosa, nigra, and viridi-glaucescens; Bambusa anceps, tessellata, and pygmæa. The other hardy aquatics include Funkias, Butomus, Primula japonica, Astilbe Davidii, Gunneras, Saxifrages, Typhas, Spiræas, Trollius, Eulalias, and Ranunculus."

Returning to the main pleasure grounds, I noticed clumps of Pampas Grass, dotted with Tritomas, and a bed entirely devoted to Delphiniums.

"Our object," said Mr. Bloxham, "is, of course, to get dark and light blue shades. The varieties chiefly used are King of Delphiniums, Belladonna, Cantab, Chaucer, formosum, Beauty of Langport, Empress Queen, Isabella, The

Digitized by Google Original from CORNELL UNIVERSITY

Guardsman, Persimmon, Bandmaster, Calypso, Faust, Hamlet, and Unionist."

"I suppose you have a number of choice Nymphæas in the ornamental water in front of the mansion?"

"Yes, chiefly of the Marliacea section; but we have also Gladstoniana, Laydekeri lilaceum, odorata, gigantea, Andreana, fulva, odorata maxima, Aurora, Ellisiana, sanguinea, gloriosa, and Robinsoniana."

Near the Italian fountain, with grass all round, is the rock garden, of which a great feature is the collection of hardy Ferns, but I asked Mr. Bloxham to mention the names of some of the flowering plants blooming in June.

"Aconites, Alyssums, Aquilegia glandulosa, Arabis, Asters, Aubrietias, Cheiranthus, Dianthus alpestris, Erigeron alpinus, Geranium Endressé, Geums, Helianthemums Attraction and others, Heucheras, Lithospermum prostratum, Lychnis, Megasea cordifolia, Papavers in variety, Phlox in variety, and Saxifrages in variety. Beyond the rockery is a great collection of Ericas, embracing a number of choice varieties."

A Magnificent Rose Garden.

"And below, the Rose garden, with its striking dome over a fountain in the centre. What is the height of the dome?"

"Twenty-five to twenty-six feet. With the Roses growing on the dome are Polygonum Baldschuanicum, Clematis, Wistaria, and Japanese Honeysuckle. A great feature of this garden is the number of Ramblers on festoons. The borders are mixed, and the beds consist of one variety only. The varieties on festoons include Electra, Trier, Mrs. Flight, Claire Jacquier, Blush Rambler, Leuchstern, Delight, Hiawatha, Psyche, Paul's Perpetual, Thalia, Aglaia, Lady Gay, Helene, Euphrosyne, Dorothy Perkins, Philadelphia Rambler, Crimson Rambler, Mr. D. J. Orpen, Queen Alexandra and Edmond Proust."

"Which varieties do you use for the beds?"

"They include Richmond, La France, Caroline Testout, Frau Karl Druschki, Madame Lambard, Dean Hole, Dr. Grill, Mrs. W. J. Grant, Betty, Ma Capucine, Jeanne Nabonnand, Maman Cochet, Mrs. John Laing, Marquis of Salisbury, Madame Hoste, Clara Watson, Hugh Dickson, Kaiserin Augusta Victoria, Madame Eugene Resal, Grace Darling, Marquise Litta, Viscountess Folkestone, and Liberty."

The Treatment of Pæonies.

"I see that you have also in the Rose garden a very fine bed of Pæonies."

"That bed was only planted three years ago; we cut thousands of flowers from it. Between the Pæonies are planted Lilium auratum, which flower after the Pæonies have ceased."

"Can you tell me the names of the Pæonies?"

"Nivalis, Modeste, Festiva maxima, Princess Christian, Comte de Paris, Deep Magenta, Humea Carnea, Claude de Lorraine, Decora, Prolifera tricolor, Triomphe de l'Exposition, Mrs. Chamberlain, Baroness Schroder, Anemoneflora alba, Vanderbilt, Achille, Princess Beatrice, Whittleyi, Prince George, Lady Leonora Bramwell, Lemon Queen, Henri de May, Berlioz, The Dragon, Pale Rose, Chrysanthemiflora, Princess of Wales, Marquis of Lorne, and others."

"With such a noteworthy collection, I should be glad if you will give me any information about the treatment."

"Pæonies, being gross feeders, require plenty of liquid manure, also an occasional dressing of artificial manure when they are growing freely. In the autumn, after they have died down, it is a good plan to cut the growths off below the surface of the soil. I know they are often cut off above the surface, but this is a mistake. If they are cut below the surface, the Pæonies are not so liable to suffer from disease. A good dressing of farmyard manure, say, from four to six inches, and put on after they have been cut back, is of great benefit to them."

"You have a nice herbaceous border in this vicinity."

"That is only a minor border, planted with dwarf varieties, and in panels of different colours. The great herbaceous border is beyond the Rose garden."

"What is the width of it?"

"Eighteen feet on each side, and it is sixty yards long. The principle of planting in panels is also observed, dwarf varieties being planted in front, and tall-growing behind. It would take up too much of your space to give you, even at this early season of the year, a list of the plants now in flower, but they include Aquilegias, Geums, Geraniums, Heucheras, Irises, Lupinus, and Pyrethrums, all in numerous varieties."

Hardy Fruit.

Just outside the herbaceous border is a large orchard, planted with Apples, Pears, Plums, Cherries, Currants, and Gooseberries, the Pears and Apples as espaliers, and the Plums as pyramids. I had previously been into another orchard, in which a number of Apples, fifteen to sixteen years old, were transplanted four years ago. These, as well as a plantation of Raspberries, a plantation of Plums (all standards), and a row of Damsons, were all looking extremely well, and in the large orchard the appearance was equally satisfactory.

"You might give me a dozen names of the best Apples on standards and pyramids."

"Charles Ross, Lord Derby, Wellington, Cox's Orange Pippin, Lane's Prince Albert, Beauty of Bath, Blenheim Orange, Royal Late Cooking, Allington Pippin, Worcester Pearmain, Bismarck, and Golden Spire. Twelve of the best Pears are Durondeau, Emile d'Heyst, Marie Louise, Pitmaston Duchess, Saint Edmond's, Bon Chretien, Doyenne du Comice, Beurre Superfin, Conference, Fondant d'Automne, Knight's Monarch, and Louise Bonne of Jersey."

Cherries on the Walls.

Passing a number of Loganberries, Japanese Whinberries, and Cumberland Blackcaps—a fruit closely resembling a Blackberry—we entered the kitchen garden inside the walls.

"Sweet Cherries," said Mr. Bloxham, "are just ripening on the walls. The varieties embrace Frogmore Early Bigarreau, Ludwig's Bigarreau, Bigarreau Napoleon, and Bigarreau de Schercken, Black Circassian, Waterloo Heart, Elton Heart, Florence, Governor Wood, St. Margaret's, The Noble, Windsor, and May Duke."

"Do you suffer from Black Currant mite?" I enquired, as we strolled round the garden.

"Very little, indeed. I always give the bushes a dressing of caustic alkali during the winter, and pick off and burn all affected buds."

"How long do you keep your Strawberries?"

"Three years. The varieties grown are Royal Sovereign (the best for forcing), Sir Joseph Paxton, Louise Gauthier (a white-fleshed variety, very sweet), Elton Pine, Givon's Late Prolific, and Waterloo."

The glasshouses, though not on an extensive scale, are very up-to-date, and admirably arranged. Proceeding through the Peach houses, Mr. Bloxham said,

"We grow here, and on the walls, including those grown outside, Peaches Alexander, Amsden June, Alexandra Noblesse, Barrington, Dymond, Hale's Early, Princess of Wales, Prince of Wales, Sea Eagle, Stirling Castle, Waterloo, Dr Hogg, Condor, and Late Admirable, with Nectarines, Cardinal, Dryden, Humboldt, Lord Napier, Pineapple, and Victoria. In the early Vinery you see Black Hamburgh and Foster's Seedling just colouring. In the late Vinery are Muscats and Black Alicante. The variety of Fig on the back wall is Bourjassotte, which is of very good flavour, though not very often grown."

"What about Melons?"

"You will see, in the next house, that we go in rather largely for them, keeping up a long succession. The varieties are Sutton's Universal, Triumph, A1, Superlative, Ringleader, Emerald Gem, and Hero of Lockinge; the Cucumbers are Telegraph and Every Day, a very fine variety."

"What do you consider the features of your flowering house and stove?"

"In the former there are in flower a number of Show Pelargoniums, Azaleas, and Schizanthus. There is also a nice batch of Malmaison Carnations, and you may like to

A VIEW OF THE GARDENS AT TONGSWOOD, HAWKHURST.

Digitized by Google Original from CORNELL UNIVERSITY

note the Spiræas, Queen Alexandra, Peach Blossom, and japonica. In the stove, Dracænas, Crotons, Palms, and Caladiums in variety are prominent. The Caladiums are Hebe, Lord Derby, Blue Major, Flambeau, etc. There are a number of Coleus, and Gloxinias are just coming into bloom."

"Do you grow many Chrysanthemums?"

"Chiefly the large-flowering. The best varieties of these are Mrs. Norman Davis, Bessie Godfrey, F. A. Cobbold, Godfrey's Pride, Henry Perkins, Madame Nagelmackers, Magnificent, Mr. F. S. Vallis, Mrs. A. H. Lee, Mrs. A. T. Miller, Mr. F. W. Vallis, Mrs. Greenfield, W. Duckham, and Madame Paolo Radaelli."

"What is your system with Sweet Peas, of which I see you have several outside in flower?"

"They are planted in rows and clumps, autumn- and spring-sown. The best varieties are Dorothy Eckford, White Spencer, Queen Victoria, Paradise, Apple Blossom Spencer, John Ingman, Hon. Mrs. Kenyon, King Edward VII., Evelyn Byatt, St. George, Flora Norton, Prince Olaf, A. J. Cook, George Gordon, Black Knight, Horace Wright, Black Michael, Frank Dolby, and Henry Eckford."

"Do you care to say anything about vegetables?"

"We grow a number of Potatoes for trial, but the chief varieties used are May Queen, Sutton's Ashleaf, Ideal, Centenary, Lord Dalmeny, Duchess of Cornwall, King Edward VII., and The Factor. Peas are a feature, the principal being Ideal, World's Record, Pioneer, Duke of Albany, Peerless Marrowfat, Superlative, Centenary, Perpetual, Autocrat, Latest of All, Gladstone, and Quite Content. Onions, I find, succeed best on well-manured and cultivated ground. The varieties grown include Ailsa Craig, A1, Exhibition, Long Keeping, and Giant Lemon Rocca. The chief varieties of Cabbage are Sutton's Favourite, April, Flower of Spring, Ellam's Early Dwarf, and Blood Red. Just outside the kitchen garden is a large bed of Kalmias, and in the new drive beyond the sheds are some of the principal beds of Rhododendrons, also a fine large bed of Lord Penzance Brier Roses."

These I was only just able to glance at and admire, while enquiring how long Mr. Bloxham had been at Tongswood.

"I came to Tongswood," he replied, "in October, 1904, as general foreman, and succeeded Mr. Brown as head gardener in January, 1906. My previous experience was chiefly gained at the gardens of Gunnersbury Park, Waddesdon Manor, Paddockhurst, and Mentmore."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 363.—ROSES.

DEAR KATE,—I have been comparing in my own mind the various ways in which my friends grow their Roses, which, by the bye, are remarkably fine this year, probably from the good effects of the heavy falls of snow in January and in March. There is my friend, Mr. Brown, who exhibits, and sometimes gets a prize (though more often a disappointment) at the shows. His whole garden is given up to Roses, and just now it is beautiful in its way, though I don't admire the bare mulch of manure which covers the soil between the plants, which are set four feet apart. He cut his Rose trees down hard early in April, for he only wants two or three very large blooms for competition; but during the rest of the year (when these are cut) his garden is, in my estimation, decidedly dull.

Then, Mr. Jones (who also goes in for the title of Rosarian, but does not exhibit much) orders hundreds of Roses at a time, and fancies that in this way he will fill his Rose garden satisfactorily. But somehow, the effect is not good. Many of the new Roses are so weak in constitution that they make no show at all in the garden, though their blooms (cockered up as the Rose growers know how to do it) are magnificent on the show-board. Planted indiscriminately (without other flowers, except a few rather untidy annuals between the rows), some of the Roses grow tall and strong, some spreading, and many remain low and weakly-looking. Again, there is something wanting in effect in this plan.

In Mr. Thompson's garden, the Roses are nearly smothered just now by the luxuriant growth of perennials, which crowd them so badly in the herbaceous borders that the poor things can scarcely see out of the foliage; and it is evident at once that Roses cannot be grown well amongst such tall growths as those of blue Delphiniums, Pæonies, Foxgloves, and Dahlias. But what is to be done? We must have Roses, and yet no place seems to suit them exactly.

I believe the right answer to this question is this—Study your plants (every one of them separately), and so arrange them (in October) that each one shall have its fitting setting. Most dwarf Roses will do well in a border three or four feet wide, arranging those which are inclined to grow strongly at the back row (three or four feet apart), and the weaker kinds in the front of them. Colours, too, need to be considered, for either masses of one tint or well contrasted shades are desirable, but a medley of all sorts is not so good.

THE HERBACEOUS BORDER AT TONGSWOOD, HAWKHURST.

Subjects to Grow among Roses.

Amongst the Roses, and at the edge of the border, you may grow dwarf bulbs (Crocus, Scillas, Snowdrops, early Tulips, etc), Violas, Forget-me-nots (Myosotis), Pinks, Carnations, etc., filling up in May with Heliotrope, blue or white Lobelia, and other low-growing things in cool tints; but all these plants must be kept in their places, and not allowed to smother a weak Rose, using them only to enhance its beauty. The border will no doubt need a mulch of well-decayed manure in spring, but this can be quickly hidden by sifting a little fine soil, mixed with one-sixth of its bulk in soot, over the surface, which you will find deodorising, as well as very becoming to the flowers, which always look their best in dark soil.

In this way, you will not be bereft of colour in your borders in July, when the first bloom of the Roses is over, for the Carnations are then just opening their buds in gorgeous and varied tints; and when these are gone, the second bloom of the Roses begins, and lasts (often) until the late autumn. Never order Roses by the hundred, but make notes of all the loveliest you see just now (ready for planting-time), adding their colour, growth, height, and their fragrance, or want of this, for many fine Roses are wanting in this charm, and without it can scarcely be called a Rose.

Roses for Amateurs.

Many of the introductions of twenty or thirty years ago are still amongst the best for the ordinary Rose grower. Amongst such are La France (pink, and exquisitely fragrant), Fisher Holmes (in richest blood-red), Caroline Testout (of fine form, in pink), Madame A. Chatenay

Digitized by Google Original from CORNELL UNIVERSITY

The author there ascribed the opening of the flowers of the night-blooming Cereus to the more liquid condition of the sap in India after the hours of sunset, and it is possible that the same explanation will cover similar instances in this country. Most, if not all, of the plants flower in summer—the Nottingham Catchfly, for example, in June or July—that is, when the sun is hottest, and evaporation most rapid. They would, therefore, be most likely to feel the effect of these conditions during the day, while any additional moisture which they obtained in the evening would have less influence on the far-off, delicate stamens than on other parts, and thus they would soon shrivel, as noticed by Lord Avebury.

A Plague of Snails.

May 29th.—I do not know whether I am peculiarly unfortunate, or whether others are suffering in the same way, but I have never seen so many snails before. This is the more remarkable, as hitherto the garden has been almost entirely free from them. This spring they swarm everywhere. They have eaten up a batch of Chrysanthemums put out in small pots; they have invaded the rockery; they have played havoc in the borders. People shake their heads and say, "Ah, that Box edging!" But in the Box edging, at any rate, I know where to look for them, and by a careful search I have found so many that I doubt if there can be many left. Certainly, their depredations have almost ceased. But, have others been troubled in the same way? It would be interesting to learn whether snails are generally more numerous than usual. It is quite possible that the damp weather of last year may have been favourable to their increase, though ants, which are favoured by dry weather, are also numerous.

H. C. DAVIDSON.

The Gardens at Castle Hill, Rotherfield.

INTERVIEW WITH MR. JOHN BLYTH.

IT would not be easy to exaggerate the natural beauties of the gardens at Castle Hill, which, by the courtesy of Mr. George Burt, J.P., I had the privilege of inspecting on a lovely day in May. And, if the natural beauties are great, everything has been done to develop and emphasise them. It was exceedingly difficult to realise the fact that thirty years ago the gardens did not exist, though the house is very old, and has a splendid site six hundred feet above sea-level. The late Sir James Stansfeld converted the original meadows and woods into pleasure grounds of the most varied and attractive character; and since Mr. Burt acquired the property, eight years ago, he has further improved and embellished it.

THE SUMMER BEDDING AT CASTLE HILL.

"There are disadvantages," said Mr. Blyth, the head gardener, as we strolled on the terrace in front of the mansion, "so far as gardening is concerned. The situation is high and cold, and the mixed clay soil is difficult to work. We have to plant between wet and dry periods, because if it is worked wet it gets very hard in summer, and cracks badly. On the other hand, we can stand drought in summer better than most people. The lawn seldom gets brown unless we have an extra dry season."

"I notice that you wire your flower beds."

"It is absolutely necessary to wire them in spring to protect the plants from the rabbits. The scheme of the five beds in front of the house for spring embraces two varieties of Wallflowers—Blood-red and Belvoir Castle. The centre bed also includes double Arabis, Polyanthus, and Myosotis. The two inner beds are edged with Euonymus radicans, and the two outer with Myosotis."

The Scheme of Flower Beds.

"How do you fill these beds in summer?"

"In the middle one we have Abutilons and Cannas, mixed with Castor-oil plants, Nicotiana of sorts, and Perilla. The two inner beds are filled with dark Fuchsias, the Euonymus edging being kept up, and the two outside with Geraniums (Madame Crousse), edged by blue Ageratums."

MR. JOHN BLYTH.

"But your principal beds are at the side?"

"Yes, there are twenty-five beds at the side. The centre is dark Wallflowers, edged with Pyrethrums. On each side there are two filled with light Wallflowers, two with double Arabis and Myosotis, two with dark Wallflowers, two with mixed Primroses, one with light Wallflowers and Myosotis, two with Aubrietias, and one with mixed Pansies."

"And in summer?"

"Last summer the centre bed consisted of white Marguerites, Oak-leaf Geraniums, and Geraniums (Madame Crousse), edged by Mesembryanthemums. Of the other beds, four were Geraniums (Henry Jacoby), edged with dwarf blue Ageratum; four, pink Geraniums (Mrs. Paul), edged with Pyrethrums; four, Manglesii Geraniums and Iresine Lindenii; four double Geranium (Madame Thibaut), edged with blue Ageratum; four, Begonia semperflorens, edged with Dactylis; and four, Geraniums (Mrs. Pollock), edged with blue Lobelias. Practically, the blend of colour was red, white, and blue, with a shade of pink. No netting is needed in summer."

Rhododendrons Without Peat.

A bank planted with shrubs forms a fine background to these beds, while below is a croquet lawn of great length.

"Shrubs," said Mr. Blyth, "do very well when they once get a start, and there are several excellent specimen trees here and there on the slopes, notably Wellingtonia gigantea, Pinus pinsapo, Abies Douglasi (the black), and Thuja. In the woods beyond there will be a carpet of blue by the end of May, consisting of wild Hyacinths. But here is what we call the new lake."

"When was it made?"

"It was finished eighteen years ago. The idea of Sir James Stansfeld was that it should represent the Shamrock in shape, with an island in the centre. The lake itself contains yellow and white Lilies, and it is studded all round with Aponogeton distachyon. The latter originated ten years ago in a little 5-in. pot, and, the plant being put out, it grew away right over the water."

"Then there are the Rhododendrons. Are they named?"

"Most of them; but they are largely mixed with ponticums. We have a great variety of colour in the blooms, and enormous trusses of flowers in June. I have not used any peat for years. I admit that I prefer it; but, as a matter of fact, the Rhododendrons do just as well in the turfy soil. The shrubs along the Green Walk, which is five hundred yards in length, are all Rhododendrons, with ornamental Conifers behind."

The Dell and Lake.

Proceeding down the Green Walk, and noting a very fine Cedrus deodara beyond, we went down steps into the woods, and so on to the dell, a charming natural retreat, with Rhododendrons conspicuous, and the golden Gorse a great feature.

"Do you give the Pampas Grass any special treatment?"

"I merely start it in light soil, and then it flourishes. A feature on the banks of the large lake which we are approaching is the collection of Weeping Willows of sorts There are also Weeping Ash and Elms, and there is an island in the centre."

"There seems to be no end to the lake."

"It was so designed as to create the impression of great length, and its effect is heightened by the boathouses, and by the thousands of shrubs which are planted near it. Two years ago the sheltered walk which you see in the direction of the house up the slopes was a ditch. Now there are standard Roses, with clumps of Sweet Peas, and borders filled with herbaceous plants. Nearer the house is an American garden, planted with Rhododendrons, Azaleas, and Kalmias. The Kalmias really require peat."

I asked Mr. Blyth to point out any other recent improvements, and he rejoined:—

"About two years ago, Mr. Burt diverted the road in front, and planted the bank with shrubs, so that the house is now entirely hidden from the road. Many of the shrubs were transplanted, and none of them have flagged in the least. We shift a number of trees every winter, without detriment to them."

Figs in a Cool House.

"You have a zig-zag walk from the house to the kitchen garden?"

The Glen at Castle Hill, Rotherfield.

"Yes, planted with flowering and other shrubs, and filled up with any plants we have to spare. The Laurustinus does well, and a Pinus nobile thrives in this walk. At the end, this side of the kitchen garden, is a Fig house, without heat."

"Do you get two crops?"

"No, only one; but we get a much better crop in July than we had on the front of the wall before the house was put up over it. The variety is Brown Turkey. In front of the house is a little Rosery, planted entirely with standards, and protected by Thujas. The principal Rosery lies below, and faces south."

Roses and Violas.

"Are the Roses mixed?"

"There are Hybrid Teas in the round beds, and Hybrid Perpetuals in the others, with Dorothy Perkins on a pole. The Rose beds are all edged with Violas, yellow, white, blue, purple, mauve, and white. The varieties of the latter are Nellie Barr, Nellie Maclean, Royal Sovereign, Skylark, and Archie Grant. A thick Holly hedge at the end provides an excellent shelter from the wind."

Entering a little Melon house, which is also used for propagating purposes, I saw some fruit well set, and, in the old greenhouse adjoining, a Heliotrope planted at the bottom and growing up to the roof is quite a feature.

The Boathouse on the Lake at Castle Hill.

"We cut flowers from here, both in summer and winter," continued Mr. Blyth, "in fact, we are not at a loss for blooms in the winter at all. Chrysanthemums last in flower until March. Only a few for large flowers are grown, but we have a quantity of the bush variety in all colours, which I use for decorative purposes. Another house is devoted entirely to Roses, the varieties being Niphetos, Frau Karl Druschki, and Pérle des Jardins. Here we have also in pots Rehmannia angulata, the flower of which is like the Foxglove. The next range was only put up three years ago. We are going to increase the number of winter-flowering Carnations. In the plant stove are chiefly Orchids, Dendrobiums being in flower."

Treatment of Browallias and Clerodendrons.

"What treatment do you give to your Impatiens, which look so well?"

"Only the ordinary stove treatment. There are two varieties, Holstii and Sultani. The Browallia speciosa major has been flowering all the winter. We find that it does better in a stove than in a greenhouse. These plants have been in flower since November, and they are very useful, because blue is a colour hard to obtain at that period of the year."

"Is there anything special in your cultivation of Clerodendrons?"

"No. They like a little peat; we dig down in the winter, and start the plants in the spring. The flowers are very useful for cutting. The variety is Balfourii. In the Croton house, Tomatoes are fruiting well. The two varieties grown are Frogmore Selected and Charlton's Emperor. Here are some more of Sutton's Scarlet Melon, Up-to-Date, Comet, and Sutton's Ringleader, the only varieties we have at present."

"You likewise grow Tomatoes outside on sticks in front of your Peach house."

"Yes, in front of a cold Peach house, which is also used for hardening off bedding plants. The varieties of Peaches are Barrington, Belle-

garde, and Stirling Castle, and the Nectarines Pineapple and Rivers' Royal."

"When do you begin to cut Grapes?"

"At the beginning of July, when we cut Muscats and Black Hamburgh in the early Vinery. Grapes are kept back in the late house as much as possible, and we get them as late as March. The varieties are Gros Colmar, Black Alicante, Lady Downe, Foster's Seedling, Black Hamburgh, and two young plants of Muscat. I intend eventually to get rid of the Black Hamburgh and Foster's Seedling. Tomatoes in pots are a feature on the stage, and Figs cover the back wall."

"Do you force many vegetables?"

"Only a few French Beans, Sutton's Forcing. As to Strawberries, I have tried several sorts, but there are none upon which I can depend so much as Royal Sovereign. Fruit begins to colour about the latter end of March."

"What are your varieties in the early Peach house?"

"Nectarines, Rivers' Early, Stanwick Elruge, Victoria, and Waterloo; Peaches, Bellegarde, Royal George, and Walburton Admirable. The Vines growing on the roof are Millhill Hamburgh, of which last year we gathered eighty bunches of fruit; it colours better than the Black Hamburgh. The late Peach house is quite cool, and nearly the same varieties are grown to keep up the succession.

Carnations and Hydrangeas.

"Do you grow anything special for your flowering house?"

"We have a large stock of summer-flowering Carnations, of which the best varieties are the White Blush, Malmaison, Churchwarden, Lord Roberts, Emperor, John Cole, Cecilia, Triumph, Prince of Wales, Mrs. Webber, and H. J. Cutbush. Hydrangeas also stand well in the house, and some of them flower in the border. The ordinary colour is pink, but, there being a good deal of iron in the soil, many of them become blue. The Violets grown in the frames are Marie Louise and Lady Hume Campbell; and, outside, Czar and Princess of Wales."

"Do you grow many Sweet Peas?"

"A few rows for cutting, and they are generally mixed. Roses and Sweet Peas are largely used for decorating in the house."

Hardy Fruit.

"I notice that in the fruit garden you have whitewashed all the trees."

"We seldom do it, but last year was such a year for vermin that we have been obliged to whitewash. The Apples are grown chiefly as pyramids, and some of the best varieties are Cox's Orange Pippin, Prince Albert, Lord Derby, King of the Pippins, Blenheim Orange, Worcester Pearmain, Keswick Codlin, and Dominie. Gooseberries are grown amongst the Apple trees, and we have to net them, and, in fact, all the bush fruit, during the summer."

"Have you many varieties of Pears?"

"A considerable number of pyramids of good sorts. Pears are also grown as cordons and on arches, with an arch of Crimson Rambler Roses at the top. But the varieties are not numerous. The Plums are Victoria, Greengage, Kirke's, and Reine Claude de Bavay. Neither the crops of these nor of any other fruit outside appear to have been affected by the weather. We used to grow Cherries on the wall now covered with cordon Pears of many new varieties, but the birds took them all. The Strawberries grown outside are Laxton's Reward, Bedfordshire Champion, Leader, and Auguste Nicaise, a late variety, and a fine Strawberry, with a good flavour. We grow extensive breadths of all the vegetables, and Peas in several varieties, of which the best are Magnum Bonum, Perfection, Bountiful, and Ne Plus Ultra."

"Where did you start your gardening career, Mr. Blyth?"

"In Scotland, under the Duke of Buccleuch, at Bow Hill, Selkirk, and I subsequently came to England, was foreman at Wray Park, Reigate, and then head gardener at The Elms, Southwold. From Essex I went to Laverstoke Park, Hampshire, and nearly eighteen years ago I came here as head gardener. Mr. Burt takes a very great interest in his gardens, and under his auspices we constantly make additions."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 304.—HYDRANGEAS, PELARGONIUMS, AND A CUTTING-BOX.

DEAR KATE,—When the last of the Azaleas are over, and before the Begonias and Gloxinias are in full bloom, the conservatory is likely to look rather dull, unless there are plenty of "Show" Pelargoniums, Hydrangeas, Cacti, etc., to fill the gap. The Hydrangeas, especially the white one, called Dr. Hogg, should be grown by everyone, for they are almost hardy (needing only the protection of a cold frame in winter), yet they can be forced into bloom quite early, or kept back until late, just as you like; they are subject to no blights, and do not require repotting every year when they are in fairly large pots—only a top-dressing of rich soil, and plenty of liquid manure once or twice a week. But, although they can be kept nearly dry in winter, they are some of the most thirsty plants possible when in growth, and should be given a saucer under the pot, or they are sure to get short of water just as they are coming into bloom. Nothing can be more desirable for house decoration than these plants, for they will stand in a hall or a shady corner for many weeks, and will only need to be placed in the open air during the autumn to recover their health thoroughly. The plants should be pruned into shape directly after flowering, and may be repotted at the same time, or they can be given a shift when necessary, just as they start into growth in the spring. The pink Hydrangea (Hortensis) is very delicate in tint when forced for early bloom, the flowers being in pale pink, shading to white. Cuttings of these plants can be rooted in July or August without difficulty, if they are kept in a cool, moist atmosphere, and will make nice little plants for the following season.

The beautiful Regal and Show Pelargoniums in many brilliant tints, contrast delightfully with the cooler tones of the Hydrangeas, but they are much more trouble to grow, because green-fly is so certain to attack them, unless measures are taken to keep this enemy at bay. The plants should be cut back after flowering to within an inch or two of the older wood, allowing their roots to become decidedly dry at the same time. Then they should be placed in a frame or an airy greenhouse for a time, syringing the plants daily, but not watering their roots more than necessary until little green shoots appear, when water will be needed more often, gradually increasing their supply as the leaves require it. When the new growths are an inch long, however, the plants should be turned out of the pots, shaking away all the old soil, and pruning any old, woody roots you may find, although as much of the fibrous rootlets as possible should be retained. They will then fit smaller pots than before, and should be repotted in good rich loam and leaf-mould, with soot and sand in small quantities, and some small lumps of charcoal if the loam be at all heavy. After repotting, they will need the same careful watering as before, always giving enough at one time to moisten the whole of the soil, then waiting until the surface soil is fairly dry before giving another dose. But these plants always enjoy syringing, and should have plenty of it at all times, except when they are in bloom. As soon as they have recovered from the shock of repotting, the plants will do best in the open air, where they should remain until the end of September, hardening their new wood in the full sunshine.

The points of their shoots should be pinched out once or twice during the autumn, to make

A HANDSOME HYDRANGEA.

BLUNT Ellen Martha of Brookside Meole Brace **Shrewsbury** spinster died 3 October 1931 Probate **Shrewsbury** 17 November to George William Blunt assistant schoolmaster and Agnes Blunt spinster. Effects £2873 7s. 7d.

BLUNT Emma Jane of 16 St. Germans-place Blackheath **Kent** spinster died 11 February 1931 Probate **London** 23 April to Thomas Herbert Sowerby manufacturer. Effects £6228 11s.

BLUNT Emma Matilda Sarah of 54 Chelverton-road Putney **Surrey** spinster died 6 December 1930 Probate **London** 5 March to Mary Maxwell Pringle spinster and James Arthur Barker schoolmaster. Effects £188 3s. 3d.

BLUNT Felix of Bridge-street Cradley **Worcestershire** died 13 March 1931 Probate **London** 15 April to Walter Charles Blunt grocer and James Herbert Hall merchant. Effects £6637 15s.

BLUNT George of 27 Lowick-terrace Moulton **Northamptonshire** died 30 May 1931 Administration **Birmingham** 15 June to Sarah Ann Mabbutt widow. Effects £64 9s. 4d.

BLUNT Henrietta of 10 Joseph-street Radcliffe **Lancashire** spinster died 4 March 1931 at the Royal Infirmary Manchester Administration **Manchester** 11 April to Emily Smith (wife of John William Smith). Effects £2382 11s. 9d.

BLUNT the reverend Henry Wilfrid of Bridgham **Norfolk** clerk died 22 January 1931 Probate **Norwich** 7 March to Blanche Mary Blunt spinster and Reginald Blunt gentleman. Effects £4183 8s. 4d.

BLUNT Hugh Roper of Strinagar Kashmir **India** died 21 January 1931 Probate **Winchester** 18 May to Dorothy Alcock (wife of George Frederick Alcock). Effects £1960 3s. 7d.

BLUNT Isabella of Blaby Hill **Leicestershire** widow died 19 October 1930 Probate **Leicester** 19 March to Isabella Bruce Baird Noel (wife of Harold Ernest Noel) Thornton Blunt bank manager James Sholto Cameron Douglas professor of pathology and Vivian Mackay Woodhouse solicitor. Effects £48583 12s.

BLUNT Jeremiah of 74 Rook-street Cottenham **Cambridgeshire** died 10 April 1931 at Addenbrooke's Hospital Cambridge Administration **Peterborough** 1 May to Mary Caroline Blunt widow. Effects £138 8s. 1d.

BLUNT John of 47 Edgehill-road Winton **Bournemouth** died 11 September 1931 at 14 The Grove Moordown Bournemouth Probate **London** 1 October to Grace Lillian Butler (wife of Alfred Trego Butler). Effects £712 0s. 9d.

BLUNT William of 225 Great King-street Hockley **Birmingham** died 12 August 1931 in Windley Pool Sutton Coldfield Warwickshire Administration **Birmingham** 14 September to Lilian Riley (wife of John Riley). Effects £391 3s. 4d.

BLURTON Gilbert of 11 Radcliffe-road West Bridgford **Nottinghamshire** died 6 September 1931 Administration **Nottingham** 4 December to John Frederick Blurton medical practitioner. Effects £1875 5s. 9d. Resworn £1751:5:9.

BLURTON Richard Albert of Woodcote Stourbridge **Worcestershire** died 18 January 1931 at Saint Chads Hospital Birmingham Probate **London** 21 May to Walter Robert Blurton stockbroker and Sydney Samuel Shakespeare cashier. Effects £29808 6s. 10d.

BLY Mary Ann of 4 Willow-avenue Sandon-road Edgbaston **Birmingham** widow died 2 September 1931 Probate **Birmingham** 24 October to Harriet Skelding (wife of Joseph William Skelding) and Walter Grove chartered accountant. Effects £591 18s. 3d.

BLYDE William Henry of 32 Upper High-street **Worthing** died 12 November 1931 at National Hospital Queens-square Bloomsbury Middlesex Administration **London** 16 December to Beatrice Kate Blyde widow. Effects £901 12s.

BLYTH Anna Maria of 69 Sussex-road **Lowestoft** widow died 20 July 1930 at the Infirmary Oulton Suffolk Probate **Ipswich** 28 October to Wallace Tibbenham insurance agent and Francis William Osborne superintendent registrar of births. Effects £1322 18s. 1d.

BLYTH Catharine of The Manse Newport **Essex** spinster died 10 June 1931 Administration **London** 23 July to Alice Mary Blyth spinster. Effects £408 6s. 10d.

BLYTH Fanny of Brook-street Dedham **Essex** (wife of Henry David Blyth) died 15 January 1931 at Bay House Stratford St. Mary Suffolk Probate **Ipswich** 12 February to the said Henry David Blyth engine driver. Effects £606 3s. 6d.

BLYTH Frances Theresa of Durley Dean Gildredge-road **Eastbourne** spinster died 22 January 1931 at 74 Royal Parade Eastbourne Probate **London** 1 April to Gerald William Pritchard solicitor. Effects £2431 5s. 2d.

BLYTH Frederick Thomas of Lothair Eastern Transvaal **South Africa** died 15 October 1930 at the Royal Northern Hospital Holloway Middlesex Probate **London** 7 July to Edith Blyth widow. Effects £335 11s. 8d.
Resworn £2599 0s. 11d.

BLYTH George Samuel of 1 Gascoigne-road Barking **Essex** died 17 December 1930 at King George Hospital Ilford Essex Administration **London** 11 February to Mary Blyth widow. Effects £162 18s. 8d.

BLYTH Henry George of 140 New England **Peterborough** died 8 December 1930 at The Memorial Hospital Peterborough Administration **Peterborough** 2 February to Henry James William Blyth fitter and Elsie Jane Blyth spinster. Effects £56 6s.

BLYTH James Alexander of 18 Queen-square **Glasgow** died 18 December 1930 Confirmation of Robert Cullen writer. Sealed **London** 21 January.

BLYTH James Frederick of Hill House Nayland **Suffolk** died 20 December 1930 Probate **London** 11 February to Annie Blyth widow. Effects £15939 10s. 7s.

BLYTH or **DUN** Jane of Woodmill **Auchtermuchty** (wife of George Dun) died 13 August 1916 Confirmation of Dorothy Maybel George Dun spinster. Sealed **London** 17 January. Former Confirmation Sealed **London** 20 March 1917.

BLYTH John of 9 Euston-road **Great Yarmouth** died 4 August 1929 Probate **Norwich** 10 January to Annie Maria Blyth widow. Effects £311 10s.

BLYTH John of Llanfoist Beeches-road Crowborough **Sussex** died 26 July 1931 Probate **Lewes** 15 September to Emma Eliza Blyth widow John Alexander Blyth gardener and Marion Hetty Blyth spinster. Effects £765 11s. 11d.

BLYTH Meredith Wynter of Lacton House Tankersley Barnsley **Yorkshire** died 25 March 1931 Probate **London** 12 June to Christiana Mary Blyth widow and Meredith Henry Wynter Blyth engineer. Effects £15324 15s. 11d.

BLYTH Mildred Constance of 39 Tisbury-road Hove **Sussex** spinster died 31 July 1931 Administration **London** 28 August to William James Blyth gentleman. Effects £757 8s. 9d.

BLYTH Samuel of 12 Long-row Highgate Kings Lynn **Norfolk** died 17 December 1930 Probate **Norwich** 31 January to James Charles Blyth railway clerk. Effects £175.

BLYTH Thomas of 57 New-street Brightlingsea **Essex** died 22 September 1931 Probate **Ipswich** 12 November to William Isaac Osborn retired council clerk and Edwin Blyth retired builder. Effects £1086 19s.

BLYTH Thomas Thornton of Temple House Temple Balsall **Warwickshire** died 22 September 1931 Administration **Birmingham** 7 October to Kate Blyth widow. Effects £1766 17s.

BLYTH William of Laverstoke Gardens Whitchurch **Hampshire** died 8 May 1931 Administration **Taunton** 4 June to Kate Blyth widow. Effects £430 19s. 5d.

BLYTHE Arthur of 42 Curzon-street Loughborough **Leicestershire** died 29 June 1931 Administration **London** 27 July to Fanny Maude Blythe widow. Effects £942 3s. 1d.

Kirk helps materially with favourite manures. Cherries on the walls were large and in quantity. Small fruits and Strawberries were abundant, but Apples had not turned out as expected. Begonias on the parterre were conspicuous for their large flowers; and other outside decoration was on a par with other departments.

PLANTS FROM KEIR AT EDINBURGH.

Conspicuous among the plants exhibited by Mr. Lunt, of Keir Gardens, Dunblane, at the Royal Caledonian Society's show, were specimens of unusually high cultural merit, and as some of the leading newspapers state, "carried all before them," Croton Chelsonii, 7 by 5 feet; C. Holdsworthii, do.; Dracæna Youngii, 7 by 6 feet; Alocasia metallica, 6 feet across; Dieffenbachia Bausei, 4 feet 6 inches through; Anthurium Veitchii with leaves 4½ feet long; two immense Dracænas Shepherdii and Baptistii, we do not know their size, but health and colouring were of the highest order; of great size were Palms Areca Baueri, Kentia Belmoreana, K. Fosteriana, Rhapis flabelliformis, and Areca lutescens, and a Cycad 9 feet through. Mr. Lunt, as reported in Edinburgh papers, received a medal for high culture. Now that this clever cultivator has made his *début* in Edinburgh with plants (he has been a successful exhibitor of fruits for some years), he will be looked for in the future, and welcomed by lovers of plants such as are really creditable at exhibitions like those promoted by the Royal Caledonian Society. *M. T.*

TECHNICAL EDUCATION IN HORTICULTURE.

ALTHOUGH it may be a new thing for County Councils to offer prizes for the nicest-kept and best-cropped gardens, as Mr. D. T. Fish suggested recently in these pages, it was part of a system practised in my own knowledge by some school-managers of over thirty years ago. When a boy a school, in a quiet Oxfordshire village, I had my small plot, and was not a little proud of the commendations received for my method of cultivating it; and it may be said that any encouragement offered in this way gives rise to a desire to acquire further knowledge on the part of the recipient. Horticultural societies in rural districts can do much towards increasing a taste for gardening amongst cottagers, by offering prizes for the best-kept garden; in fact, I know of no better way of improving the cultivation of their gardens than by offering money-prizes to those *bonâ fide* cottagers. Some persons may retort, but what is a *bonâ fide* cottager? Well, it is perhaps a difficult question to answer. I have filled for the last ten years the office of secretary to a society which is mainly intended for the improvement of cottage-gardens in this neighbourhood, and have therefore had much opportunity of observing the progress which has been made by some of the competitors. We have two classes of competitors whose status is defined by the amount of wages earned, and which does away with the jealousy that arises when some are handicapped by their neighbours who happen to be in receipt of higher wages, and have therefore an advantage in the matter of purchasing seeds and plants.

The two classes are defined thus—those whose regular weekly wages exceed 15*s.*, and those who are not in receipt of that sum. The spirit of emulation is keen in the cottage gardener, and they will try hard not to be beaten by their neighbours, working laboriously to improve their gardens in their spare moments. According to my experience of teaching horticulture by means of lectures, something is required beyond speaking; the mere matter of preaching to them, as it were, is not sufficient to interest them. If County Councils were to instruct their teachers to give demonstrations on the platform in such subjects as the pruning of fruit trees, including root-pruning, preparatory to planting them, and the best means of staking the trees, much real good would be done. It is not merely a question of how many bushels of Potatos ought to be produced from so much land; nor how much a cottager should get for his fruit crop—but how such crops are best obtained, and the best methods to pursue. A few practical demonstrations of this kind would do much more towards enlightening the hearers than the chatter that some lecturers indulge in. Plenty of cottagers in rural districts can judge the amount of practical knowledge possessed by the lecturer more accurately than he supposes, and if they discover that his teaching is largely based on theory, the impression that he will make on them is not lasting. Lectures without demonstration are almost valueless in teaching cottagers how to manage their gardens, they know perfectly well that the lecturer would not know how to do the work he professes to teach them. *E. Molyneux.*

—— It seems at this time of day almost superfluous to dispute either that there is a need for, or a benefit derived from, technical education. But as an example of the need of such teaching, I would quote from that excellent magazine, *Work*, where, on p. 247 of the June number, we find this note:—"According to the report of the London County Council, by Mr. Llewellyn Smit, apprenticeships have practically died out in all trades excepting a few, such as shipwrights and barge-builders, so far as London is concerned." He adds that workmen he has come into contact with have been practically unanimous in thinking that the old system cannot be revived, and that technical education, imparted through classes, must in future take its place.

But apart from the consideration of such questions as those involved in the above statement, any thinking person must be struck with the fact that so-called education does not produce, or tend to produce, that all-round development of the bodily and mental capacities as intelligent persons desire. There is no doubt, owing greatly to the dull and rigid routine of our elementary schools, where memory takes the place of thinking, and the standard of attainments required, seems to indicate that boys and girls are supposed to turn out a mongrel—something between a clerk and a philosopher. The training of the children in the elementary schools seems chiefly to fail in not teaching them the common facts of every-day life. But as soon as we begin in the technical school to teach them how to do something, daylight and hope begin to dawn on us.

Of what use is it to teach children how to add up thousands of pounds? But when we see a child able to darn its stocking, or sharpen a knife, there seems to be a clear gain to the child and humanity itself.

Now the experience of practical men in this immediate neighbourhood is most encouraging in respect of the acceptance and result of technical education. The first season it was put into working order, the attendance was very small, hardly making an average of ten. But this last season has seen an average attendance of thirty, taking several villages together; and about 400 at Wolverton. At the lectures attended by these people, instruction was given by practical and proficient men in bee-keeping, fruit-growing, and vegetable culture, and diagrams, implements, apparatus, and specimens of growths for pruning were handled before the spectators, and at intervals, under the control of the chairman, the audience were encouraged to enter into discussion on points raised by the lecturers.

One important subject handled was the method of the prevention and cure of insect pests and diseases of fruit trees and general crops, and, considering the ravages of the Gooseberry-sawfly for the two last seasons, it is a matter of congratulation that the lectures made the matter so clear, and gave it so prominent a place. Since the spread of this information, people take a hint much more readily regarding the method of dealing with these diseases and pests, and several cottagers have saved their crops by following instruction based upon information given at these lectures.

So much good has already resulted from the practical and sociable way in which the instruction was imparted—for in some cases a little music and recitation helped to draw and keep the people together—that it is to be hoped next winter will see a further development of this form of teaching a knowledge of matters of every-day use, and if the allotment-holders of the neighbourhood can be influenced to the same extent as the men at Wolverton, who work small patches of land there, a decided advance will be soon manifest in the methods of work, and better crops, the outcome of intelligently-directed effort.

It remains to be seen that fuller demonstrations are afforded of methods of pruning, and courses of tillage, the management of bees, &c., during the summer months, and thus we may hope that the intelligence of our rural population will steadily increase. *J. Milsom.*

Obituary.

DEATH OF MR. G. BOGUE.—Many will hear with regret of the death of Mr. George Bogue, of 10, Hill Street, St. Albans, which took place, at the age of 86 years, on Tuesday, September 19. Mr. Bogue was a native of Lanarkshire, and came to St. Albans as head gardener to Lord Verulam, at Gorhambury, about forty-six years ago, and remained in his lordship's service for twenty-eight years. In his time Mr. Bogue was a gardener of some repute, and used frequently to contribute articles to the *Journal of Horticulture;* while for many years he supplied annually to this paper a rainfall table. The deceased, during his connection with Gorhambury, was a member of the committee of the Royal Horticultural Society, and seldom failed to attend their monthly meetings in London; and in the latter years of his life the deceased often referred with pride to this, and would speak in glowing terms of the times when he had sat at a committee meeting with the late Prince Consort. During the last eighteen years Mr. Bogue had lived a life of retirement. The funeral took place at St. Michael's Church, St. Albans, on Saturday, September 23.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

where such has not already been given them, for where the plants grow well they are admired and appreciated by nearly everyone.

The glass houses are not very extensive, and are devoted principally to fruit, Grapes being a good feature. Some large bunches were noticed of the renowned Raisin de Calabre used mainly for decorative purposes. Black Hamburghs were well represented, the berries being very fine. In the structures devoted to plants, Ferns were exceptionally good, as also were Palms and Crotons.

The kitchen and fruit gardens both looked well, the latter having been very heavily cropped. Apple trees were in a few cases blooming for the second time, and this after carrying exceptionally fine crops of fruit. Mr. Mackinnon is to be congratulated on the excellent state of the gardens which he has under his control.

TYNNINGHAME.

There are many things worthy of mention at this, one of the residences of the Earl of Haddington. The gardens are and have been for many years past in the charge of Mr. R. P. Brotherston, well known as an excellent gardener, and as a contributor to the *Journal of Horticulture*. The gardens are a credit to any gardener, and though the glass structures have mostly seen their best days they yet contain some fine plants and fruit. Plants are very largely grown for affording cut flowers here, and foremost amongst these come the Carnations, of which a very choice collection has been brought together. Souvenir de la Malmaison in various shades are grown in large numbers, and appear to be in the best of health, though showing, owing doubtless to the extraordinary season, a tendency to premature flowering, which may detract somewhat from the value of the plants next season. The beautiful Germania is also extensively cultivated, many hundreds of layers having been rooted this year. Sweet Peas, too, are a great feature, most of Mr. Eckford's best varieties being grown. Amongst these are some very beautiful colours, one of the best being Countess of Radnor. Affording as they do an abundance of flowers these Sweet Peas must be invaluable. The Blue Pea (Lathyrus sativus) is also grown, and a small clump of it is a very beautiful sight, and is moreover useful for decorative purposes. Mignonette thrives admirably, producing huge spikes of its deliciously scented blossoms, the variety Machet being perhaps the largest.

The flower garden is furnished with Zonal Pelargoniums, Calceolarias, Tritoma Uvaria, and other plants, and was looking very gay when I was there. The crop of Apples has been a wonderfully heavy one, as also has the Pears, many of both having been gathered and yet leaving bushels on the trees. Pears on the walls were looking grand, many of the very best varieties being planted, notably Clapp's Favourite, Souvenir du Congrès, Williams' Bon Chrêtien, and Louise Bonne of Jersey. Plums too were hanging here and there, but the majority had of course been gathered. Indoors the Vines were looking splendidly, and some very serviceable bunches were hanging. Tomatoes too were fine. The plants indoors were in excellent health, and Crotons especially were very highly coloured. Ferns are grown in large numbers, and some highly creditable specimens were noticed. On the shore of the Firth of Forth, upon which the estate is situated, the Sea Buckthorn was looking beautiful and carrying a huge crop of its brightly coloured berries. There were many other plants and fruits worthy of note, but I must leave those to be dealt with by others at some future time. A visit to Tynninghame will be conducive to thorough enjoyment, and much valuable information may be gained in walking through the gardens with Mr. Brotherston.—NOMAD.

EXPERIENCE WITH APPLES.

AT the time when the characteristics of Apples and the value of the crops can be best judged, a few notes from cultivators would be opportune and instructive. I send three which may perhaps lead to others from cultivators in different parts of the country.

WEALTHY.

IN your report of the discussion that took place at the last meeting of the R.H.S. Fruit Committee, I notice that some members expressed their strong disapproval of the growth and bearing habit of this Apple. With me the growth is moderately strong, with a slight symptom of canker showing on one or two shoots of last year's growth. There is, however, nothing to give cause for alarm in that respect, as the cold, heavy soil here is certain to develop canker if the variety is addicted to it in any way. The tree from which the fruit was gathered was a maiden in 1891, and this year bore eight Apples, all equal to those before the Committee. Many were removed by thinning when quite small to give size to those retained. One of the Apples measured 12 inches round. In the Journal of September 21st I note it is being largely grown at Denver, an Apple-growing district in America. Here Wealthy is thought highly of; so much that I hope to increase our stock very considerably in the coming planting season.

ECKLINVILLE.

No Apple that I know will grow better and give a larger return of fruit in a short time than this, but what is the use of the quantity if there is difficulty in disposing of the produce? As is well known this is a "soft" Apple, easily bruised, and fruiterers with whom I have done business refuse to buy Ecklinville at any price. If this is the case in one town, is it not likely to be the same in others? How, then, is it possible to dispose of the fruit? Much as I appreciate this Apple for its growth, cropping, and cooking qualities, I am compelled to warn others of the risk they run in planting it extensively.

DUCHESS OF OLDENBURG.

Anyone requiring a good early cooking Apple to be grown as an espalier could not do much better than plant this Russian Apple. The finest crop I have seen of it was produced by an espalier-trained tree in the garden at Hill Place, near Bishop's Waltham. The fruit was packed as close as it could be on all the branches, was of large size and magnificently coloured. I was much impressed with the variety after seeing it so successfully grown.—E. MOLYNEUX.

PEASGOOD'S NONESUCH.

THIS Apple has done well in the neighbourhood of Bristol. We recently saw fruit grown in the gardens of Cote House (Mr. Bannister, gardener), on a bush tree, one fruit weighing 1 lb. 12 ozs.; two weighing 3 lbs. 7¾ ozs.; six weighing 8 lbs. 13½ ozs.; twelve weighing 15 lbs. 13 ozs. —JAS. GARAWAY & CO.

DEATH OF MR. G. BOGUE.

MANY readers of the *Journal of Horticulture*, as well as ourselves, will hear with deep regret of the death of Mr. George Bogue, of 10, Hill Street, St. Albans, which took place just before midnight on Tuesday, September 19th. The deceased, who reached his eighty-sixth birthday only on the previous Wednesday, was familiarly known throughout the city, owing to his long connection with it. He had been in failing health for some time, yet he was out a fortnight before his death. It was then that he took a cold, and it seemed doubtful if he would recover, his constitution having been impaired by a serious illness in the spring. Mr. Bogue was a native of Lanarkshire, and came to St. Albans as head gardener to the Earl of Verulam, at Gorhambury, about forty-six years ago, and remained in his Lordship's service for twenty-eight years.

Many years ago Mr. Bogue used frequently to contribute articles to this Journal, which were of a sound practical character. Mr. Bogue also for many years supplied annually to the "Herts Advertiser" a rainfall table. As showing the interest Mr. Bogue always took in this kind of work, it might be mentioned that only a few weeks back, when showing the apparatus to a friend, he expressed his wish to have it fitted up, and thought he should begin again. The deceased, during his connection with Gorhambury, was a member of the Committee of the Royal Horticultural Society, and seldom failed to attend the meetings in London, and in the last few years of his life the deceased often referred with pride to this, and would speak in glowing terms of the times when he had sat at a Committee meeting with the late Prince Consort. During the last eighteen years Mr. Bogue had lived a life of retirement, and filled the office of churchwarden at Christ Church for a long period. He, however, gave up his position some five years ago owing to increasing age, and on that occasion he was presented with a valuable inkstand as a mark of the esteem in which he was held. There are only a few distant relatives of the deceased in England at the present time, most of his nearer relations having emigrated and attained to very good positions abroad. The funeral took place in the St. Michael's Churchyard, St. Albans, on Saturday afternoon, September 23rd. (St. Michael's Church is within the precincts of the ancient Roman city of Verulam, and contains a fine marble monument of the famous Lord Bacon). The service was conducted by the Rev. W. Horne, and among those who followed to pay a last tribute of respect to the deceased were Miss Henley and Miss Allard (sisters-in-law), Mr. Horsfield (steward to Earl Cowper), who is a nephew of the deceased's late wife; Mr. Garner, Mr. J. Child, Mr. W. Dunham, Mr. W. Bowes, and Mr. Whitelaw (gardener to Lord Grimthorpe at Batchwood).

The "Herts Advertiser," from which the foregoing record was mainly taken, did not reach us till after the publication of our last issue. It was while our late contributor, coadjutor, and friend, who has passed away so full of years and honour, was gardener at Gorhambury that articles from his pen appeared in the *Cottage Gardener* and *Journal of Horticulture*. These were stamped by the teachings of experience, and were proof of cultural attainments of a high order.

SOFT VERSUS HARD COLD WATER.

MY first remarks upon this subject may, I admit, be open to misconstruction, but were certainly not written with the object of implying "W. P. W." had betrayed confidence in any way, the reverse being the case. I hope in future to strictly avoid touching the very sensitive feelings which "W. P. W." appears to possess, and will now content myself by taking a careful survey of the articles written, and endeavour to explain a few facts, prove a few statements, and accept without hesitation the challenge thrown out by "J. B. R." (page 286), therefore I can only touch lightly upon the first-mentioned correspondent's article to save repetition. The "subtle shaft" which "W. P. W." has hurled with such mighty force falls harmless to the ground, and leaves me still free to concentrate time and attention to "J. B. R.'s" article, in which he distinctly implies that I wish to turn the matter into other channels. This is decidedly wrong; my conviction strengthens rather than diminishes. I have no intention to "play upon words" in this communication, my duty being to accept the challenge to quote

the weather is warm and dry, the Potatoes make short tops, and mature early, and the Cabbages, having plenty of light and air, grow as well as they would anywhere else; but, if much rain falls, the long tops spread over the ground, and

Mr. T. H. Bolton.

smother the plants between. This sometimes happens even with the early varieties, which, ordinarily, are more or less dwarf. It has happened this summer. My Early Ashleaf Potatoes grew as if they were bent on running a race with Up-to-date, and where the later varieties will stop I do not know. Cabbages between such plants as these have no chance of growing properly, unless the distance between the ridges is unusually great. What, under such circumstances, is one to do? Plant in alternate rows, and turn the Potato tops over on to the ground left vacant? The objection to this method is that the Potatoes are sure to suffer from the crowding of the foliage. Another plan which is sometimes adopted—shortening the tops—seems to me as foolish as the old custom, now abandoned, of almost entirely denuding Tomatoes of their leaves. It must be prejudicial to the crop. The best method is to insert sticks in each row, run string along, and so support the tops. It means some slight labour, of course; but, if it is worth while taking the trouble to plant Potatoes and Cabbages on the same plot, it is surely worth while taking the additional trouble to enable them to grow properly without injuring one another. Moreover, the tops, kept from contact with the damp earth, are not only more easily sprayed, but also less liable to be attacked by disease.

Cucumber-leaf Blotch.

August 9th.—An incident mentioned in a leaflet issued by the Board of Agriculture will show how exceedingly careful gardeners should be to prevent the infection of their plants. In connection with a fungoid disease known as Cucumber and Melon-leaf blotch, we are told, "an establishment in Hertfordshire, sending Cucumbers to Covent Garden, remained free from the disease until the commencement of the present season, when, on one occasion, some empty flats or packing boxes that had contained Cucumbers, sent from a place where the disease was known to be rampant, were by mistake returned from Covent Garden to the Herts establishment, where, from that date, the disease appeared, and is now practically beyond control. To test the possibility of this means of introducing the disease, an empty box that had contained diseased Cucumber leaves sent to Kew for determination, was placed over a young Vegetable Marrow plant that was growing under glass; within three days every leaf was destroyed by the disease."

August 10th.—Plants seldom look at their best in a nursery, because of the formal methods of planting which are almost inevitable there, but a field of Roses, like the one shown in the illustration, is different. It is a glorious sight in July. The variety depicted is White Pet, one of the Polyantha section, bearing quantities of creamy-white flowers, and when seen in the mass its beauty is wonderful—hardly less so in the dim twilight than it is in strong sunlight.

H. C. Davidson.

The Gardens of the Earl of Devon at Powderham Castle.

INTERVIEW WITH MR. T. H. BOLTON.

It was my good fortune, by the courtesy of the Earl of Devon, to visit Powderham Gardens at the end of May, when the splendid collection of flowering shrubs was at its best. Under the auspices of Mr. T. H. Bolton, who, in the spring of 1906, undertook the control and renovation of the gardens, important improvements are being carried out, which will materially augment their beauty. Even as it is, however, they form a fine setting for the historic castle, which passengers on the line between Exeter and Torquay are wont to admire. The creepers on its ancient walls are quite in keeping with its character. Ampelopsis Veitchii climbs up its clock tower, its walls are adorned with Clematis montana, Wistaria sinensis, Magnolia grandiflora, Roses (Madame Falcot), Oleanders, Lonicera, and Jasminum; one side of the chapel is covered by Ivy, and the other by Magnolias; while in front of the castle are several Myrtles.

The Terrace Bedding.

"The bedding," said Mr. Bolton, as we strolled along the terrace, and I noticed the numerous vases filled with Ivy-leaf Geraniums, and the fine specimens of Irish Yews standing at the corners of each bed, "is planned with a view to the blending of colour. A scheme of pink and white for centre beds, encircled with yellow Calceolarias, we find very attractive, and appropriate for our beds laid out in grass. For the terrace beds, with Box edgings and gravel paths, and in geometrical designs, we use Heliotropes, yellow Calceolarias, scarlet Begonias, and white Geraniums, which, seen from above, are usually admired during the summer."

"And in the spring?"

"Well, as you see, there has been a combination of blue, pink, yellow, and brown, with green edging, formed by Myosotis, Silenes, Wallflowers in variety, and Pyrethrums."

"The Silenes are very effective."

"Yes, they are a great feature, and are extremely easy to grow. From a packet of seeds I was able to bed out a couple of thousand."

From the castle we proceeded to the Camellia house, observing on our way some fine specimens of the deciduous Cypress.

"When was the Camellia house built?" I asked, impressed not only by the pleasant approach, but by the size and loftiness of the house.

"About twenty-eight years ago. The trees are planted out in large vases, and the Camellias are in flower all through the winter. There are quite a dozen trees. The Roses all round the roof are Niphetos. At one end is a house we use for Malmaison Carnations. The varieties are Duchess of Westminster, Maggie Hodson, Thora, Mrs. Trelawney, Cecilia, Calypso, and Sault; they were all grown from cuttings put in last July."

"And the house at the other end?"

"That is practically used as a flowering house, containing just now a few Primula obconica, a number of Humea elegans (which do well here), and Sweet Peas in pots."

Powderham Castle.

"You make a feature of Sweet Peas, I believe?"

"I am very fond of them. These are all crosses from King Edward and Helen Lewis."

"They look so well that I should like to know something about your methods of cultivation?"

"One absolutely essential possession is good

deep soil, which always gives the cultivator an advantage over a man whose soil is of a shallow and light nature. Thorough preparation of the soil, by deep digging or trenching, is necessary, and at the same time there should be worked in a good dressing of well-rotted stable manure, old Mushroom beds, and a fair sprinkling of wood ashes and soot. On dry, sandy soil I advise the use of half-rotted manure, and, if some heavy loam or turf can be spared, it should be chopped and mixed in, as the preparation of the soil goes on. This ought to be done some weeks in advance of the time it is intended to plant or sow the seed."

"Do you sow your first batch in autumn?"

"No; that method, owing to the risk of losing a large percentage of the plants by birds, slugs, and other pests, is, in my opinion, not desirable. I think that better results are obtained by sowing in pots or seed-boxes in January. A greenhouse is a suitable place to raise the seed, and immediately the plants are above the soil they should be moved to a position near the glass roof. In the course of a week or two the plants should be removed to a cold frame, where they soon assume a sturdy appearance, and, by March, will be hardy, ready for planting out in rows, clumps, or any convenient position. If in rows, a shallow trench, three inches deep and one foot across, should be taken out, and the ground made fairly firm. The young plants can then be carefully lifted out of the boxes, or turned out of the pots, and planted singly four inches apart. Except in the case of novelties, or very scarce varieties, a double row may be planted in the trench, allowing nine inches in the rows. As under this treatment each plant usually throws from three to six strong growths, it is obvious that the distance given between the plants is none too much. My experience is that it generally results in a well-furnished row by flowering time, which should be June. If grown in clumps, I recommend the same distance between the plants, and the larger the clump, the finer the effect, especially if it be situated in a mixed border, where so many of us find it necessary to grow Sweet Peas."

THE GARDENER'S HOUSE AT POWDERHAM.

Staking and Shading.

"What about staking?"

"Directly after planting, the rows or clumps should be staked with short, twiggy branches, which afford the young plants a little support and protection. The rows should be dusted with lime or soot, to avert the ravages of slugs; in about six weeks they should be staked firmly with tall sticks; Hazel branches are preferable. The sticks should be left untrimmed, as the Sweet Pea is a great rambler. If the weather be dry, the rows on either side should be mulched with stable litter, and given thorough drenchings of water when needed, with a hose or large-rosed can, especially after a hot day. This not only benefits the plants, but helps to keep thrips at bay. In order to secure the true colour of several varieties, shading must be resorted to during the hottest part of the day, as the orange varieties in particular seem to be scorched or scalded by the hot sun. Light tiffany stretched over them is a suitable material, and well repays the trouble, as several of the varieties needing this attention are amongst the prettiest Sweet Peas."

"How long does the supply of flowers from the January sowing last?"

"From early June to August, but by that date they will be past their best, and the flower stems, which are long at the first, will have become much shorter. It is, therefore, advisable to sow a second time in March, particularly if it is intended to exhibit in August, which will produce first-quality flowers from the beginning of that month onward. The seed can either be treated as I have already mentioned, or it can be sown direct in the prepared ground, where it is intended to grow the plants, and given the same treatment throughout as those planted in January. Thin sowing should, of course, be insisted upon; but, now that a dozen seeds of new sorts cost a shilling, there is no temptation to sow thickly. To avoid the risk to losses attached to outside sowing, these more expensive varieties should be sown in pots."

Experiments in Crossing.

"The results of your own experiments prove that there is nothing to hinder a professional or an amateur gardener from crossing suitable colours, with the object of securing something new, or an improvement on existing kinds. Can you give me any hints on this point?"

"Having selected a calm, dry day, a quantity of pollen should be collected with a camel's-hair brush into a small envelope or seed packet, from such varieties as Lady Grisel Hamilton, Navy Blue, or Mrs. Kenyon, and applied carefully to the stigmas of young flowers of Countess Spencer or Helen Lewis, with a view to securing new shades of blue or pale yellow, combined with the pleasing form of the two latter varieties. The crossing should take place when the flowers of the variety intended to carry the seed are quite young, as there is then less chance of the flower being self-fertilised. A small label should be attached to the stem, with the names of the different varieties. The pods should be gathered as soon as they turn brown, as in wet weather they fly open, and the seed drops to the ground. Strict attention to such details as thin planting or sowing, mulching and copious watering during dry weather, and the sowing of a second or even a third batch, to prolong the supply of flowers, are amongst the principal items to be observed by those who wish to excel in the cultivation of the Sweet Pea."

The Vineries.

Outside this range of houses are many Roses, including a variety called Adam, and Madame Lambard, and two clumps on each side of choice Rhododendrons, close by being a quantity of bush fruit, including Raspberries (Superlative), and Black Currants (Boskoop Giant). Here, too, the Vineries demanded notice.

"There are three," observed Mr. Bolton, "the early Vinery containing Black Hamburgh and Foster's Seedling, and I have lately introduced a few rods of Muscat of Alexandria. In the second house there is only one Vine, Black Hamburgh, and in the late house it is the principal variety, being the favourite Grape. The few Orchids in the late Vinery are Cœlogyne cristata, Cypripedium insigne, and Dendrobium nobile. There are also some Ferns, a number of the old scarlet bedding Begonias, and Begonia Gloire de Lorraine, of which last year I grew about a hundred and fifty. But now we had better go to the American gardens, which constitute, most people think, the greatest charm of Powderham."

A Famous Eucalyptus Tree.

"They are extremely lovely," I rejoined, as we entered the gates of the large portion of the pleasure grounds which is devoted to flowering shrubs, and is enriched by numerous choice trees. One of the latter is worth travelling many miles to see. I mean the most famous old Gum tree in Great Britain.

"What is its age?" I inquired, as Mr. Bolton calculated its dimensions, while I noted its huge branches.

"Probably from seventy to seventy-five years old. It is really Eucalyptus coccifera, and not the better-known globulus. The dimensions of this tree are, at four feet from the ground, fourteen and a half feet in girth, and it has a spread of thirty-two to thirty-four yards in diameter."

"What is the essential difference between the two varieties?"

"Globulus is killed by frost, but nothing injures coccifera. It is quite hardy. The flowers are white, and the leaves are very pungent."

"Are there any other exceptionally fine specimen trees?"

"The Tulip-trees, Copper Beeches, Cedars, and Pines are noteworthy, but the Eucalyptus is quite the gem."

"I suppose you plant bulbs largely by the side of the ornamental water?"

"About thirty thousand. For instance, I had a great batch of Sir Watkin Daffodils. Phormiums, by the way, bloom well near the water, and I am thinking of planting a collection of Lilies. I am gradually planting Palms."

The Azaleas and Rhododendrons.

"To me, the supreme attraction of these glorious American gardens is the huge clumps of Azaleas, Rhododendrons and Camellias."

"They were planted purposely in great groups, and I believe it would be difficult to surpass the number of varieties and wealth of flowers of the Azaleas. There are now in bloom, bright scarlet, orange, golden, pink and salmon, of the Ghent section. These, as well as the Rhododendrons, were chosen for colour, the latter being chiefly white, scarlet, and pale pink."

"Camellias seem to do as well in the open as Rhododendrons and Azaleas."

"Quite as well. We have thousands of blooms of both white and red varieties, and no attention whatever is given to them."

Hardy Fruit.

Then, after spending some further time admiring the magnificent display of colour, we returned to the kitchen garden. This, like the head gardener's house, is beautifully situated on the slopes of the hill.

"The soil, too," resumed Mr. Bolton, "is as good as it could be for growing hardy fruit or vegetables. It is red Devonshire loam, which helps in a dry summer. But at present we are rather in a state of transition here."

"What varieties of Peaches do you grow on the walls?"

"Royal George and Dymond are two of the best, and Violette Hative the best Nectarine. We grow similar varieties inside, and also Grosse Mignonne. Both inside and outside we are planting new trees. We are also just planting newer varieties of Apples, keeping the best varieties of the older sorts."

"Are all Apples grown as pyramids?"

"Most of them. We find that the best dessert varieties are Gladstone, Roundway's Magnum Bonum (an excellent Apple), Cox's Orange Pippin, Margil, American Mother, Court Pendu Plat, Blenheim Orange, Ribston Pippin, and Adam's Pearmain, the best of all. The pick of the kitchen varieties are Ecklinville Seedling, Lord Grosvenor, Stirling Castle, Warner's King, Lord Derby, Tower of Glamis, Keswick Codlin, Peasgood's Nonsuch, and Mère de Menage."

"Which Pears do best at Powderham?"

"Duchesse d'Angouleme is the best for dessert and showing purposes, and for dessert purposes I should also include Pitmaston Duchess, Fertility, Souvenir du Congres, Napoleon, and Beurré Diel. These are grown on the wall, as well as on pyramids. The best stewing varieties are Catillac, Vicar of Winkfield, and Uvedale's St. Germain. Pears and dessert Cherries are also grown on the outside wall, and Plums on the west wall, the three varieties being Kirke's, Oullin's Golden, and Early Transparent."

"Do you grow many varieties of Strawberries?"

"Only three—Royal Sovereign, Bedford, and Givon's Late Prolific, a very fine Strawberry for late purposes. Tomatoes are also grown on the wall, two useful varieties being Stirling Castle and Holmes' Supreme."

The Best Vegetables.

"When did you start digging Potatoes?"

"Last week. The earliest variety is Puritan, and the others Up-to-date and Windsor Castle. Onions are rather a feature here. One bed of Ailsa Craig contains seven hundred bulbs."

"Do you usually begin picking Peas in May?"

"Yes, we shall commence next week with Harbinger. The other varieties are Sutton's Green Gem, Early Giant, Peerless, Duke of Albany, and Gladstone. I grow these in quantities, rather than multiplying the varieties. The best Cabbage I have is Flower of Spring, which I grow largely. The Carrots in the pits are Sutton's Intermediate and Champion Horn. I am planting new beds of Asparagus, Barr's Mammoth, and Canadian Green."

"I notice that your own plan of planting Sweet Peas is in clumps?"

"Of which there are three or four dozen just beginning to bloom. The kitchen garden being four and a half acres in extent, I am turning it to account as much as possible for the cultivation of flowers. There is, for instance, a large bed of Gladiolus (The Bride), and the herbaceous border, which runs the whole length of the garden on the top slope, and is a hundred and fifty yards long, has only been recently made. I am growing from seed in this border, Delphiniums, Phlox, Michaelmas Daisies (in great varieties), Humeas, and Border Carnations (Winter Cheer, Raby Castle, and Francis Rameulson—a standard apricot colour, raised a few years ago, and sent out by Messrs. Clibran). I am also going in for a border of Chrysanthemums, choosing the varieties for colour, such as Carrie for deep yellow, Market White, and Goacher's Crimson."

"Has your experience been varied, Mr. Bolton?"

"I commenced my gardening career at Chillingham Castle, Northumberland, under Mr. Henderson, one of the best-known and most skilful gardeners in the North. After leaving Chillingham, I served as journeyman at Lowther, Harewood, and Fenton House, and as foreman at Milnerfield, Witney Court, and in the flower gardens at Clumber. I also spent twelve months in the Orchid houses of Messrs. Charlesworth, of Bradford."

"Which was your first appointment as head gardener?"

"At Coombe End, Kingston Hill, ten or eleven years ago. There I exhibited with a fair measure of success at Kingston, Surbiton, Wimbledon, and Richmond shows, Chrysanthemums, table plants, and Sweet Peas being my favourites. In 1902 I took charge of the gardens at Baron Hill, in Anglesea, where outdoor gardening was well carried out. Early in 1906 I came here. The difficulties are considerable, but, with a splendid situation, an ideal soil from a gardener's point of view, and an employer like Lord Devon, who is taking a keen interest in his estate, I hope to be able to place Powderham Gardens on a footing which will compare with others in this country."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 262.—CARNATIONS, AND PLANTS FOR AN AUTUMN BAZAAR.

Dear Kate,—Have you seen King Solomon? I don't, of course, mean the original owner of this title, as you are scarcely old enough to remember him; but the magnificent Carnation of this name. One involuntarily thinks of the rest of the text, "Even Solomon, in all his glory, was not arrayed like one of these," for this flower is indescribably splendid in ruby-velvet, shading towards the middle into rich apricot; but this description does not in the least do it justice. It is perfect in shape, too, and a robust and hardy plant, which is most satisfactory in the garden.

A Famous Eucalyptus Tree.

A New Carnation.

Another fine new Carnation is called Basuto; it is a sport from the better-known variety Zingara, but excels it in colour and form, being heavily flaked and barred in scarlet and maroon on a buff ground. Cæsar and Pompey is the queer name of a very handsome Carnation, brightly marked with carmine on a white ground; and Grey Friar is quite a contrast to these warm tints, being in blue-grey, flushed with pink.

Amongst the finest of the self-tinted Carnations are the following:—Carabas, which gained the highest possible honours in the R.H.S. and Birmingham Carnation Shows; it is a perfect and immense flower, in a rich shade of pink. The Old Guard is not so large, but in a glorious shade of intense scarlet, and of good shape; Afterglow is a fine flower in deep pink; Taillifei is a bright salmon-red Carnation, a great beauty; Mrs. Shenton is a lovely flower, in apricot; Agnes Sorrel is deep dark maroon in colour; Lady Hermione is lovely, with a perfect form in rose colour; and Queen of Sheba is apricot-yellow; whilst Daffodil tells its own shade of yellow, and a fine colour it is.

These are all first-rate varieties, and they are doing grandly in the garden here—hundreds of buds and flowers are opening, and I think this gravel soil suits them. But the border in which they grow was deeply dug (two feet down) and richly manured in the early autumn of 1905, before they were planted (in October); last year they flowered finely, but, of course, the plants were young, and rather small. This year they cover the bed with their strong, healthy growths and masses of flowers. We are now going to take cuttings from them, and also layer some of them, as the plants will be past their best after this season, and it is better to have young plants put in every third year if you want perfect blooms.

The yellow-ground Picotees are greatly admired, too. Amphion is the name of the one I like best of all, a superb flower in clear yellow, heavily edged with carmine; Gronow is something like it, but still more deeply edged; and Sarchedon is of the same class; Dalkeith, too, being very handsomely edged with red. I prefer these deeply-edged Picotees to the rest, but if you care for the yellow Carnations, with narrow edges of pink, get Louisa and Lady Avebury, which are both perfect flowers of this class, of excellent form and substance.

For a Floral Stall.

So you want to know what you can have to sell at a bazaar in October or November, in a flower-stall? It is rather a bad time of year (especially October) for the business, but, still, there are several things you might do at once towards it. First of all, get some good bulbs of the earliest Roman Hyacinths, and start them in boxes of light soil (placing the bulbs near the top, and only half-covered, four inches apart each way), which should stand in a warm, sunny corner out of doors, covered to the depth of two inches with sand, moss, or fine coal ashes, which have been well exposed to the air for a week or two, to expel any noxious gases they may have in them.

We find it a good plan to cover the top of the

regarded as amongst the possibilities of a not remote future. One plant, a violet-shaded semi-double, has distinct Violet perfume. Possibly this perfumed strain may eventuate in giving us bluish-tinted flowers. Crossing Begonia Baumanni with the pointed-leaved tuberous section, has resulted in the production of seedlings, many of which, whilst of very compact growth, have quite rounded leaves. From crosses of this kind it is hoped may eventuate a very distinctive strain in habit, as well as securing perfume. The best Begonias are inside in great variety and beautiful leafage; and of Amaryllis of the best strains, the firm raise thousands annually, a big sowing is just germinating, whilst myriads of plants may be seen in divers stages of growth. Seedlings flower about the third year, and from the seed stage until blooming time should not be allowed to rest. Next spring, a large batch may be expected to flower. That the interest in zonal Pelargoniums is not exhausted is evident, because here not only are ordinary forms being intercrossed and seeded, but many fine seedlings are blooming; and there are a few plants of an almost miniature or dwarf strain, of various colours, from which genuine bedding varieties may develop, which would supersede the too coarse bedders of the present day. A very fine double white is, perhaps, the most promising of the strong growers; the pips are as fine as are those of Raspail.

Roses do well outdoors, especially on the seedling Briar, and there are large batches of double Carnations seeding apparently pretty well. After all, the chief specialty at this season is found in Chrysanthemums, of which the firm have some 2500 strong plants in pits; besides which there are about 500 seedlings, many of which are from own-saved seed. Mr. Reid is an enthusiastic hybridist, and carries his camel's-hair brush with him everywhere, so that no opportunity to secure a successful cross is lost.

It is too early to note what results have come from his labours appreciably, but in one of the houses a large number of plants have flowers in various stages of development, especially of what may be called the October section. "For," said Mr. Reid, "it is certain that we shall soon have, of Japanese forms, varieties as fine, as varied, and as plentiful as we have of November varieties." That result will be found useful, not only in giving a long season, but of rendering possible a series of October Chrysanthemum shows, and thus relieving November of what is at present very undue pressure.

In the production of imported seed from Spain and Portugal, we learn that insects are the chief fertilisers, but their work has neither aim nor connection. The human fertiliser, on the other hand, works for the securing of specific objects; hence the results from intelligently-fertilised flowers are so much better. Mrs. George Jones, somewhat of the Louis Bœhmer form, becoming pure white, promises to be a fine flower. So too does Souvenir de M. Menier, large flowers, colour of Jeanne Delaux. Ulrich Brunner is a very fine tasselled form, of crimson-chestnut colour. M. G. de Dubor is a handsome reflexed flower, gold ground, with bronze shading, Another, Carl Kaiser, has crimson-red petals, shaded brown, and tipped gold. Mr. R. Brabant is coming on in fine form, so too is W. H. Lincoln, in its rich yellow lustre; and the pure white Anna Hartshorn is very fine.

However, the great show of Chrysanthemums at Earl's Court next month will enable the firm to show all their new early varieties to the best advantage. Of course the stock includes all the best forms of the day; but the novelties, both from the continent and English raising, are so numerous, that selection becomes bewildering. However, the trade growers like the firm at Sydenham, have to bear the brunt of the testing, and the private grower benefits by their considerable and none too profitable labours.

Obituary.

George Bond.—It is with regret that we have this week to record the death of Mr. George Bond of Clematis Cottage, Lydbury, North, Shropshire, which occurred on Tuesday, the 6th inst., at the ripe age of eighty-six years. His interment took place at Lydbury, North, on Saturday, the 10th inst., and was attended by a number of the *employés* of the Right Hon. the Earl of Powis. It may be interesting to our readers to learn that the late Mr. Bond was in his youth in Kew Gardens, and his first visit to Walcot, the Shropshire seat of the Earl of Powis, was to paint a sketch of a very fine specimen of the Mango tree. Subsequently, he accepted the position of head gardener, which he retained for the long period of forty-seven years, during which time he served three Earls of Powis. By the last, owing to his advanced age, he was pensioned off, and has for eight years enjoyed his well-merited repose. There is at present in the "Walcot grounds," a very fine specimen of Douglas Fir, planted by Mr. Bond on March 22, 1842; on May 12, 1892, it measured as follows:—Height, 107 feet to the top of leader; girth, 12 feet 9 inches at 4 feet from the ground, and is estimated to contain 400 square feet of timber. As a master, Mr. Bond was kind and considerate, deservedly respected by his *employés*, and his retirement from the active duties of life was much regretted.

Samuel Farquhar.—There was laid to rest in Echt churchyard on Saturday, the 17th inst., the remains of Samuel Farquhar. Mr. Farquhar, who had reached the age of 86 years, was for the long period of 52 years head gardener at Dunecht House, near Aberdeen, and during that time he enjoyed the esteem of the former proprietors, Mr. Forbes and the late Earl of Crawford and Balcarres. His tenure of office was no sinecure, and in particular during the time the laying-out of the lawns and policies of Dunecht House was in progress the whole of the work devolved upon Mr. Farquhar. The successful manner in which he carried out the arrangements amply justified the confidence reposed in his ability by the Earl of Crawford, and has been the source of general admiration. On account of advancing years Mr. Farquhar relinquished his post at Dunecht House in 1877, and since then has resided with his son, Mr. J. Farquhar, agricultural auctioneer, Old Echt.

The Weather.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending September 17, is furnished from the Meteorological Office:—

"The *weather* was fair and dry over the greater part of the Kingdom; but, dull, unsettled, and very rainy over the northern and western portions of Ireland and Scotland.

"The *temperature* was again below the mean in the north and west, but just equalled it in many parts of England, and slightly exceeded it in 'England, E.' The highest of the maxima were registered on rather irregular dates, and ranged from between 70° and 73° over the southern, eastern, and Midland districts, to 62° in 'Scotland, N.,' and 59° in 'Scotland, W.' The lowest of the minima were recorded at most stations during the middle part of the week, when the thermometer fell to between 33° and 40° over England, between 36° and 38° in Scotland, and to 34° in Ireland, but only to 45° in the 'Channel Islands.'

"The *rainfall* exceeded the mean in 'Scotland, N. and W.,' and also in 'Ireland, N.;' in 'Scotland, N.' the excess was very large. In all other parts of the Kingdom there was again a deficit, and in most of the English districts the fall was very slight.

"The *bright sunshine* was very little prevalent in the north and west, but a fair amount was recorded in most parts of England. The percentage of possible duration ranged from 61 in the 'Channel Islands,' to between 40 and 46 over eastern, southern, and south-western England, and to only 19 in 'Scotland, E.,' and 10 in 'Scotland, N.'"

Markets.

COVENT GARDEN, September 22.

Potatos.

Markets remain dull, and prices low. At our railway Potato depots, stocks have been increasing. Best samples off bright soils, 60s. to 70s.; do., dark, 45s. to 55s. *J. B. Thomas.*

Mr. George Bond, of Clematis Cottage, Lydbury, North Shropshire, died, we regret to hear, on August 16, aged 86 years. Mr. Bond was in his youth employed in Kew Gardens, and his first visit to Walcot, the Shropshire seat of the Earl of Powis, was to paint a sketch of a very fine specimen of the Mango tree. Subsequently he accepted the position of head gardener, which he retained for the long period of forty-seven years, during which time he served three Earls of Powis. By the last Earl, owing to his advanced age, he was eight years ago pensioned off. A note as to a very fine Douglas Fir which Mr. Bond planted in the gardens at Walcot appeared in THE GARDEN of September 10 (p. 224).

Bond, George.—A young gardener at Kew, who succeeded Thomas Duncanson in 1826 as Botanical Artist to Kew. In 1835 he became gardener to the Earl of Powis at Walton. His drawings of about 1700 plants are in the collection in the Herbarium.

once destroy. A few penceworth of tar employed in this way will, without any further trouble, be the means of destroying numbers of these insects, whose larvæ are among the most destructive pests the gardener or farmer has to contend against.

—— It is stated in the Italian papers that the recent HAIL-STORM AT MILAN was of unusual violence. Many persons who took refuge from it in the Victor Emmanuel Gallery were in great danger from the broken glass which fell upon them, and had to seek shelter in the shops. All vegetation in and about the city suffered greatly, and many birds killed by the hail-stones were found in the streets.

—— HORTICULTURAL PROFANITY.—The *Norristown* (Pa.) *Herald* says that a man in Lower Marion wrote to the editor of a horticultural journal, and asked "What are the most advantageous additions to dried Grasses for winter ornaments?" The editor replied: "Acroclinium roseum, A. alba, Gomphrena globosa, and G. globosa carnea." When the Lower Marion man read this he fairly boiled with rage, and immediately sent a note to the editor ordering the paper to be discontinued. He said no editor who swore that way, just because he asked a simple question, should have his support.

—— I HAVE seen several queries as to how to DESTROY ANTS, and I give you my experience of fifteen years in New-Mexico, where there are a great many. We have three ways of getting rid of them. 1. If they are where they can be stirred up with a hoe, persistently stirring up the nest every day or two will eventually run them away. 2. Pouring a little coal oil on their nest every few days until they are all killed or have left 3. Make a mortar bed of their nest, stirring the ants in with the mud, and after having made their nest into mortar carry the mortar away. Either of the three ways will rid you of them if well done; but as perseverance is one of the main characteristics of the ant, those who would get rid of them must also be persistent.

—— IN some of the papers an allusion is made to the old practice of using CLOTH COVERS FOR COLD FRAMES. These are sufficient for protecting hardy plants, but will not answer for such tender kinds as Tomato, Egg Plant, and Peppers, until very late in spring. They have been tested by our market gardeners and found wanting, as the destructibility of muslin is so easy and rapid they have not been found to pay. The regular glazed hotbed sashes, now made by machinery so cheaply, are much better adapted to the purpose, and last so long that they cannot well be superseded by the cheap contrivances that quickly become, in a manner, useless.

DEATH OF MR. W. B. BOOTH.

WE regret to announce the death of Mr. W. Beattie Booth, a name honourably known in the world of horticulture for half a century. Mr. Booth died at his house in New Road, Hammersmith, on the 18th inst., aged seventy, and will, no doubt, be lamented by a large circle of friends. He was born, we believe, in Perthshire, and at an early age was placed under his uncle, Mr. Beattie, then gardener to the Earl of Mansfield at Scone Palace—the school in which David Douglas, Robert Fish, and other celebrities were trained. On coming to London he entered the gardens of the Horticultural Society at Chiswick, where he acted in the capacity of garden clerk till 1830, when he left to fill the situation of gardener to Sir Charles Lemon, at Carclew, in Cornwall. While at Chiswick he published, in conjunction with Mr. Alfred Chandler, of the Vauxhall Nursery, a work called "Camellia Britannica," for which Mr. Chandler made the drawings and Mr. Booth wrote the letterpress. Only a few parts ever appeared, as it was found to be a commercial failure. During the time Mr. Booth was at Chiswick he kept the meteorological register for four years, from 1826 to 1830, when he left for Carclew. He also contributed several papers to the "Transactions" of the Horticultural Society, and subsequently to the periodicals of the day.

Though he went as gardener to Carclew, he soon received promotion, and when he left in 1853 he filled the office of land steward and general superintendent of the estate. So highly was he esteemed, that when he left Cornwall he received the presentation of a handsome silver salver, with this inscription: "Presented by the tenants and workmen of Sir Charles Lemon, Bart., residing in the parish of Mylor, Cornwall, to William Beattie Booth, Esq., on his leaving Carclew, as a small but sincere token of their regard and esteem. August, 1853."

Through being a share proprietor in the Royal British Bank, when that failed Mr. Booth sustained considerable loss of property, and he then for a time held the office of Assistant Secretary to the Horticultural Society, an office which he held with much credit; and all who came in contact with him will remember how courteously he performed its duties. When the Society became "Royal," and went to South Kensington, its objects, or rather projects, were so grand, and its aims so elevated, that a gentleman of Mr. Booth's practical turn could not see any of them, and so he retired, leaving it to others of a more adventurous and self-sufficient constitution to carry them out. How they did it everybody knows. Mr. Booth continued to be a member of the Floral Committee of the Society till the day of his death, and was also an Associate of the Linnean Society.

NATIVE MOSSES.

I HAVE looked with great interest for a few lines from some of your contributors, but have failed to find any, on those beautiful plants our native Mosses. Being a gardener in Kent, and not a great way from that famous place Keston Common, I and a friend paid a visit to it a few evenings back, and we found it completely matted together on all sides of us with beautiful Mosses, many of which deserve an important place in cultivation. The humble and apparently insignificant Moss is an active agent in some of the most important changes of Nature; by the large amount of moisture which it absorbs, its decay and subsequent renewal in succession, the hardest rock upon which not even a blade of grass could grow becomes covered in the course of years with a stratum of fertile soil, supporting luxuriant trees. At first a little dust is blown into the interstices of the rock, into which are also driven by the winds some of the seeds of the Moss from a less sterile spot; here they vegetate, and the hitherto naked rock becomes covered with pretty green tufts, which, spreading wider and wider year after year, its whole surface is at length covered with the smiling carpet of Nature. The continual growth and decay of the Mosses and other small plants gradually increases the thickness of the soil, until at last the noblest trees of the forest clothe the once hard and barren rock with the richest products and the grandest vegetation. Thus sandy heaths and deserts are converted into verdant and fruitful fields.—J. H., *Gardener to B. F. Overbery, Esq., The Trellis, Bickley.*

A SCARECROW.

IT is well known that blue and scarlet colours in juxtaposition cause a dazzling effect on the eye. These colours strung on a line and placed over Strawberry beds produce a puzzling effect on birds, and no bird will enter the garden while these colours flutter in the air. Pieces of blue and scarlet calico should be cut about 1½ foot in length, and tied to a line 1 foot apart. An old flannel petticoat will supply a large quantity of inexpensive scarlet strips. This line is to be supported by poles 6 feet in height from the Strawberry beds. To support Strawberries, keeping them clean and enabling them to ripen all round, take a piece of stout wire a yard in length, bend it at right angles 10 inches from each end, bend the space between the right angles into a curve. Stamp these two ends 6 inches in depth into the earth close to the Strawberry plants, then draw the fruit over the wire, each plant requiring two. To prevent rusting place the wires in creosote three or four days, and then dry them.—OBSERVER.

NORMANTON PARK.

THE SEAT OF LORD AVELAND.

DYER, in his poem "The Fleece," dwells on

> "The clover'd lawns
> And sunny mounts of beauteous Normanton,
> Health's cheerful haunt, and the selected walk
> Of Heathcote's leisure."

It was named after the Normanvilles, who became its possessors at the Conquest. From them it passed to the De Basings, Mackworths, and Heathcotes.

The situation of this place is well chosen; the hall is built on high ground, commanding extensive views of the most picturesque scenes in this part of the county of Rutland. In the distance are seen the woods of Exton and Burley-on-the-Hill, and in the valley there is a large stream of water which has been formed into a lake, with an island in the middle. This lake is seen from the windows and the flower garden, and adds much to the beauty of the scenery. There is a good-sized deer park, in which there are some fine avenues of trees,

are always increased by pipings. Going once into a small garden in July, the owner of which was a fancier of Pinks, we saw a handlight or two placed amid some Currant bushes. They were used for striking the pipings under. A small square bed, corresponding to the size of the handlight, was made up of some light sandy soil—white sand is almost or quite indispensable to striking cuttings of Pinks—and in this the pipings were inserted thickly, and the light placed over them. Here they took root well, and but very few were lost. A cool bottom, a shady spot, and suitable soil being provided, there is no reason why plenty of Pink pipings should not be raised in this way. Many business men residing in suburban villas are in the habit of taking a few cut flowers to town with them every day. Pinks are very enduring when cut, and with Roses, Brompton and Intermediate Stocks, some Sweet Peas, a few sprigs of early-sown Mignonette, and a few trusses of a large-flowered Pelargonium, make up a posy of sweet-scented flowers fit to set before a queen.

The recent dry, cold weather has brought with it visitations from all kinds of vermin, grouped under the general head of blight. Peach and Plum trees especially, in the fruit garden, appear to be this season affected; and if the ravages of these pests are to be stayed, constant attention is essential. The trees must be looked over, and all curled leaves affected by blight should be picked off and destroyed. Syringing (unless some preparation of a destructive character is used) appears to be of little avail; the removal of the affected leaves, and water at the roots in dry weather, are the best remedies—the one to get rid of the insect agency, the other to force the trees into growth. All late-planted fruit trees, and especially wall trees, should be constantly watered and kept mulched by placing some manure on the surface of the soil about the roots. It must not be forgotten that the present is a critical time in wall-tree cultivation, for the trees are now making the growth that will develope the fruit-buds for another season; and unless there be the production of a healthy, vigorous foliage now, the prospects of a fruit crop for another season will be indeed uncertain. Especially should the cultivator guard against the plants becoming dry at the roots.

There is one thing window gardeners are apt to overlook during summer, and that is the necessity that exists for cleansing the leaves of the plants from the deposits of dust that will be certain to lodge on them, especially in the streets of London. The most tastefully arranged boxes lose much in the matter of effect, while positive injury is done to the plants. Vegetable physiologists tell us that the leaves of a plant play an important part in the economy of Nature, and that if the delicate pores become covered with a crust of dirt a certain derangement will follow. Nothing can be handier and more easily worked as a cleansing medium than a small lady's syringe. The window can be lifted, and from the interior the fine spray emitted by the syringe can be brought into play on the leaves of the plants without injury to the flowers. It is very seldom that a steady mild rain can reach window plants on the exterior of the sill—parapet, cornices, blinds, and other contrivances, interfere with its descent. On a gusty day especially a great deal of dust is gathered up by the wind and deposited on the plants. A daily syringing should be applied in such weather.

Obituary.

William Beattie Booth died June 18, aged 70. Such is the announcement in the daily papers of the death of one of the most refined and talented of the gardeners of the present age, one of the kindest and gentlest of men, and one who was endowed with intellectual qualities of no common order. Mr. Booth appears to have been a native of Perthshire, and was initiated in the art of gardening at Scone Palace, under his uncle, Mr. Beattie. When about twenty years of age, in February, 1824, he entered the garden of the Horticultural Society at Chiswick, as a labourer in the arboretum department, and was transferred in August of the same year as an under-gardener to the Experimental Department. While employed at Chiswick he assisted Dr. Lindley in laying out the garden, and also in planting the trees forming the arboretum. In July, 1825, he was appointed garden clerk, which post he occupied for several years. During this period he commenced the meteorological observations for which Chiswick afterwards came to be renowned, and these were continued by him up to June, 1830, when they were taken up by the late Mr. Robert Thompson. In 1830 he assisted Mr. Alfred Chandler in the publication of his *Illustrations of the Camellieæ*, which was published in numbers, the drawings being made by Mr. Chandler and the descriptions by Mr. Booth. Of this work Loudon, in his *Gardeners' Magazine* for that year, remarks, "It is highly creditable to the gardening profession that there should be found two young men, the one an assistant in his father's nursery, and the other with no pretensions beyond those of a good gardener—and who, we understand, has actually accepted the situation of head gardener to a gentleman—capable of producing such a work. It is true that the one, from having been born in a nursery famous for its Camellias, and the other from having had an excellent school education in Scotland, having been bred up under one of the best kitchen gardeners in that country, Mr. Beattie, of Scone, and having long been first gardener and afterwards clerk in the Horticultural Society's Garden, have had extraordinary advantages; but how frequently are such advantages comparatively neglected! We are proud to see such young men growing up to succeed us in the world, and think we feel almost as much interest in them as if they were our own sons." In 1830, as referred to by Loudon, he went to Carclew, near Penryn, as gardener to Sir Charles Lemon, Bart., and, in the *Gardeners' Magazine* for 1837 we read, "New kitchen gardens, with flower gardens and shrubberies attached, are now forming at Carclew under the direction of Mr. Beattie Booth. Mr. Rutger, who has lately returned from that part of the country, and has visited these gardens, speaks of them as among the most interesting he ever saw." During this period Mr. Booth's name frequently appears in the *Botanical Register*, attached to descriptions of new plants flowered at Carclew, and which he communicated to Dr. Lindley. Amongst other now familar plants Echeveria secunda was thus named and first described by him, the description appearing in the *Botanical Register* for 1838, misc. 112, and a figure in the volume of the same work for 1840 (t. 57).

Mr. Booth continued to superintend the gardens and estates at Carclew until 1853. In 1858, in consequence of the death of Dr. Royle, certain changes were made in the official staff of the Horticultural Society. At that time Dr. Lindley was appointed to succeed Dr. Royle, while the post of assistant secretary was handed over to Mr. Booth, who for some few years thereafter conducted the business arrangements of the Society with an ability, combined with suavity and gentlemanly bearing, which did much to make the Society popular. On the removal of the Society to South Kensington the increased business incidental to the more enlarged operations of the Society—now the Royal Horticultural—was too much for Mr. Booth's failing health, and he consequently resigned his post, and has since lived in retirement, continuing, however, his services to the Society as a member of the Floral Committee, at which, however, his attendances for some time past have, owing to infirmity, been few. In him the members of that body, and the profession at large, have lost one of their brightest ornaments and most perfect exemplars.

In 1825, then merely a young gardener, Mr. Booth was elected an Associate of the Linnean Society, an honour which he had thus enjoyed for nearly half a century. *T. M.*

Variorum.

Sale of the Meadowbank Orchids.—At the last day's sale at Steven's Rooms, on the 19th inst., the following prices were realised:—Vanda suavis Patersoni, 100*s.*; Aerides purpurascens, 294*s.* and 180*s.*; Saccolabium Dayanum rubescens, 200*s.*; S. Dayanum maculatum, 110*s.*, 105*s.* and 140*s.*; Aerides Lobbii delicata, 180*s.*; Vanda insignis, 120*s.*; Catleya Mendelii, 100*s.*, 105*s.*, 160*s.* and 210*s.*; Cypripedium Stonei, 200*s.*; Vanda cristata grandiflora, 160*s.*; Cattleya Warscewiczii picturata, 150*s.*; C. Trianæ rubra superba, 130*s.*; C. Trianæ superba, 120*s.*; C. Trianæ picturata, 160*s.* and 100*s.*; C. Warneri pallida, 105*s.*; C. Mossiæ, 130*s.*; Cymbidium Mastersii, 100*s.*; Miltonia Clowesii superba, 160*s.*; Cypripedium barbatum superbum, 200*s.*; Odontoglossum grande giganteum, 210*s.*; Anguloa Clowesii, 420*s.*; Zygopetalum Wallisii, 170*s.*; Odontoglossum hystrix, 140*s.*; O. nævium majus, 178*s.* 6*d.*; Masdevallia, the Lindeni variety of Harryana, 130*s.*; M. Harryana violacea, 100*s.*; M. Veitchiana, 110*s.*; M. coccinea, 190*s.*; Epidendrum vitellinum, 110*s.*; Odontoglossum citrosmum, 220*s.*; Lælia autumnalis grandiflora, 190*s.* and 168*s.*; Miltonia Regnelii superba, 110*s.*; Odontoglossum nebulosum giganteum, 170*s.*; Cymbidium Mastersii, 120*s.*; Zygopetalum rostratum, 100*s.*; Cattleya maxima grandis, 130*s.*; Dendrochilum filiforme, 160*s.*; Disa grandiflora kermesina, 90*s.*; Dendrobium chrysanthum, 252*s.*; D. moniliforme, 130*s.*; D. Farmerii, 105*s.*; D. tortile roseum, 160*s.*; D. heterocarpum, 120*s.*; Lælia elegans superba, 170*s.*; Cattleya Eldorado splendens, 231*s.*; Cypripedium, like caudatum, 178*s.* 6*d.*; Lælia Perrinni major, 130*s.*; Cattleya Regnelii, 180*s.*; Lælia anceps Dawsoni, 252*s.*; Oncidium zebrinum, 220*s.*; O. varicosum, 120*s.* Amount sold on the third day, over £1000. Total amount of three days, over £3000.

The Weather.

June 18.—Overcast.
— 19.—Overcast during the morning; fine and partially overcast in the evening; again overcast at night.
— 20.—Overcast; a little thin rain fell between noon and 1 P.M.
— 21.—A very fine day. Small amounts of light cloud were at times present.
— 22.—Light clouds were generally prevaleot till evening; cloudless after 8 P.M. Lowest reading of thermometer on grass, 32°.
— 23.—Generally cloudy, but fine.
— 24.—The weather was variable, and requent heavy thundershowers fell.

—— In the neighbourhood of the metropolis the reading of the barometer at the level of the sea increased from 30.39 inches at the commencement of the week to 30.54 inches by the morning of the 15th, decreased to 30.11 inches by 9 A.M. on the 17th, increased to 30.31 inches by the evening of the 18th, and was 30.17 inches at the end of the week. The mean reading for the period was 30.29 inches, being 0.05 inch higher than that of the preceding week, and the departure in excess of the average of the corresponding week, as deduced from observations extending over eighteen years, was 0.32 inches. It is also worthy of remark that the readings of the barometer have been above the average on every day since the commencement of the present month, to the mean amount of 0.27 inch.

The mean of the highest temperatures by day was 65°, the extremes being 70¾° on the 15th, and 59¾° on the 20th. The lowest temperatures at night ranged from 51¼° on the 18th, to 41¼° on the 14th, with a mean value of 47½°. The mean daily range of temperature was 17½°, the greatest being 27¼° on the 15th, and the least 8¼° on the 18th. The mean daily temperatures of the air were as follows:—14th, 51°.3; 15th, 55°.1; 16th, 53°.8; 17th, 55°.3; 18th 54°; 19th, 54°; 20th, 52°.1; and the departures in defect of their respective averages were 7°.7, 3°.9, 5°.2, 3°.7, 5°.1, 5°.2, 7°.4; therefore the mean temperature for the week was 53°.7, or 5°.5 below the average of the same week as deduced from fifty years' observations. On the 15th a thermometer with blackened bulb in vacuo, placed on grass in the full rays of the sun, read as high as 163°, and on the 16th and 19th the highest readings of this instrument were 144° and 146° respectively. The lowest readings at night of a thermometer on grass with its bulb fully exposed to the sky were 32° on the 14th, and 35° on the 15th. The sky was overcast throughout on the 18th and 20th, and generally so on the 16th; and on the other days, though the weather was fine, large amounts of cloud were frequently prevalent.

The general direction of the wind was N.N.E., and its strength was gentle, except on the 16th, when a brisk breeze was experienced; the horizontal movement of the air between midnight on the 15th and midnight on the 16th being 460 miles. Rain fell on two days, viz., the 16th and 17th, and the amount collected was 0.56 inch.

In England the extreme high day temperatures ranged from 76° at Wolverhampton to 63° at Newcastle-on-Tyne, the general average over the country being 69¾°. The extreme low night temperatures varied from 45° at Sunderland to 37° at Hull, with a general average of 41½°. The mean range of temperature in the week from all stations was 28¼°, being as high as 34¾° at Wolverhampton, and as low as 19¾° at Norwich. The mean high temperatures observed by day ranged between 65° at Blackheath and Liverpool and 56¼° at Newcastle-on-Tyne, the general average being 62°. The mean low temperatures observed by night varied from 48° at Liverpool to 44° at Newcastle-on-Tyne, with an average value of 46½°. The mean daily range of temperature in the week was 15½°. The mean temperature for the week was 52½°, the highest being at Sheffield and Liverpool, 54¾°

Thouars's figure that the same thing happens to the large convolute bracts. This unusual singularity has suggested the name Pesomeria (πιπτω, I fall off, and μερος a part of any thing); of which the following is a character and description.

PESOMERIA.

Nat. ord. ORCHIDACEÆ, § EPIDENDREÆ.

Sepala subæqualia, libera, spontè decidua. *Petala* conformia, basi columnæ adnata, persistentia. *Labellum* posticum, cum columna connatum, basi gibbosum, limbo indiviso convoluto. *Columna* clavata, semiteres, clinandrio dentato. *Pollinia* 4, cuneata.——Herba *terrestris;* caule *tetragono;* foliis *membranaceis plicatis;* racemo *laterali simplici*, bracteis *spontè secedentibus;* radicibus *crassis, simplicibus, fibrosis.*

1. P. tetragona.

Epidendrum tetragonum. *Thouars Orch. Afr. tt.* 33. 34.

Sepala carnosa, patula, oblonga, carinato-acuminata, luteo-viridia, intùs fusca, lineis intensioribus, omninò libera, æqualia, spontè decidua! ferè pollicem longa, 3 lineas lata. *Petala* aliquotiès breviora et angustiora, obovata, acutissima, intùs luteo-fusca, cum columna parallela ejusque basi utrinque adnata, haud decidua. *Labellum* posticum, convolutum, carnosum, cum columna semiconnatum, imâ basi gibbosum, cuniculo intus pubescente; laminâ obscurè luteâ, venis divergentibus fusco-purpureis, latiore quam longa, apice cuspidata et crispa, intùs sparsè villosâ, lineâ mediâ elevatâ latâ carnosâ sursùm sulcatâ. *Columna* clavata, semiteres, clinandrio dentato. *Stigma* lunatum, rostello plicato? *Anthera* obtuse conica, pilis albis erectis villosa, apice membranacea, bidentata, suberosa, obsoletè 8-locularis. *Pollinia* 4, cuneata, cereacea, materie pulverulentâ elasticâ cohærentia (ulteriùs indaganda).

7. EPIDĒNDRŪM Boothĭānūm.

E. *Boothianum;* pseudo-bulbis ovatis subdiphyllis, foliis ligulato-oblongis undulatis apice subobliquis, racemo terminali laxo sub-7-floro basi spathaceo foliis longiore, sepalis petalisque subæqualibus patulis ovali-linearibus acutis fusco-variegatis, labello semilibero rhomboideo acuto utrinque deflexo.

I have had an account of this pretty species of Epidendrum in my possession for nearly two years, without being able to satisfy myself about its being certainly new, so many are the species of this extensive genus. Upon a recent examination of the evidence it does appear distinct, and therefore it is named in compliment to Mr. W. B. Booth, one of the most intelligent gardeners in this country, to whom I am obliged for a drawing and the following description of it; Sir Charles Lemon has supplied me with some excellent specimens.

" This curious plant is a native of the Havannah, from whence it was brought by Capt. Sutton of Flushing, near Falmouth, in the spring of 1835, and added to Sir Charles Lemon's collection at Carclew, where it flowered in September.

" *Pseudo-bulbs* flat and compressed, growing in large masses, and laid over one another with great regularity. Each bulb is nearly round, and about an inch in diameter, tapering a little towards the crown, which is terminated sometimes by *one*, but more generally by *two*, thinnish, rigid, smooth, slightly recurved, yellowish green leaves, from four to six inches long, and an inch broad, reflexed and undulated at the margin with an obtuse, oblique, and emarginate point. *Scape* about six inches high, in our specimen seven-flowered, round, erect and pale green, issuing from a thin, oblong, two-edged, pointed kind of sheath, which rises from between the two leaves, and which in old decayed specimens is seen to proceed with the flower-stem from the crown of the pseudo-bulbs. *Flowers* produced on pedicels of about an inch in length, small and round at their junction with the scape, but otherwise three-angled and twisted. *Sepals* spreading, oblong acuminate, nearly uniform in size and colour, excepting the two inner ones which are somewhat narrower than the rest. All of them are of a dingy yellowish green, irregularly marked on the inside with dull reddish brown spots, and a little reflexed at the edges. *Labellum* pale yellow, nearly white, cordate acute, with the sides bent downwards and much recurved, about as long as the sepals and projecting horizontally from them with the column to which it is partly attached. *Column* about half the length of the labellum, rather paler in colour, becoming greenish and faintly spotted at the base, from which it thickens outwardly, and has on each side a deep longitudinal groove that gives it a triangular appearance. *Anthers* deep yellow, seated in a depression at the extremity of the column.

" On first comparing the plant with the figure of *Epidendrum variegatum* of the Botanical Magazine, I was almost inclined to consider them identical, but a closer examination has led me to alter my opinion, although it must be acknowledged that the two are very closely allied. The principal points of difference appear to be in the size and form of the pseudo-bulbs, which in *E. variegatum* are oblong, whereas

in the present species they are round and flat. The leaves of the former are striated, sometimes in *threes*, and have a blotched or variegated appearance—of the latter they are quite plain, and do not appear to be ever more than *two*. The scape of the plant before me issues from a long thin sheath, whereas the one referred to has no sheath. The column and lip are also different from Dr. Hooker's figure, but in general character and appearance they nearly agree; except that E. variegatum is a much larger plant."

The following new Epidendra form a part of the many undescribed species now in our gardens; the account of them is from the pen of James Bateman, Esq. the author of one of the most splendid works on Natural History that has ever issued from the press; it is needless to say that I speak of the "Orchidaceæ of Mexico and Guatemala," of which one part has appeared, and a second is in an advanced state of readiness for publication.

8. EPIDENDRUM papillosum. *Bateman Mss.*

"E. *papillosum;* foliis strictis linearibus carinatis acutis in pseudobulbos pyriformes glaucescentes ternatim insidentibus, scapo erecto simplici multifloro foliis subæquali, floribus distantibus, sepalis ovato-lanceolatis acutis, petalis paulo angustioribus obtusis, labello semi-libero 3-partito, laciniis lateralibus obovatis, intermediâ 3-plo majore obscure quadrilobâ versus basin callosâ, columnâ bidentatâ, pedunculis papillosis."

Hab. in Guatemalâ. *Skinner, v. v. c.*

"Sepals and petals of a greenish brown, lip white, with three minute pink veins. Column orange-coloured at its apex. Next E. squalidum, from which its habit alone would at once distinguish it."

9. EPIDENDRUM tessellatum. *Bateman Mss.*

"E. *tessellatum;* pseudobulbis ovalibus compressis 2-raro 3-phyllis, foliis lineari-lanceolatis scapo simplici flexuoso multifloro paulo brevioribus, floribus subpatentibus, sepalis lanceolatis acutis mucronatis, petalisque minoribus subspathulatis; labelli liberi trilobi laciniis lateralibus rotundatis, intermediâ majore oblongâ cucullatâ callis tribus cristigeris longitudinalibus munita."

Hab. in Guatemalâ. *Skinner.*

"Sepals and petals greenish on the outside, but brown on the inside, and marked with regular streaks of a darker

OBITUARY.

We regret to announce the death of Mr. W. Beattie Booth, which took place on the 18th inst. at his residence, in the New Road, Hammersmith. In old times, he was garden clerk at Chiswick, from which he went to Carclew, a Cornish estate, where he was general manager for very many years. He afterwards held the office of assistant-secretary to the Royal Horticultural Society until its removal to South Kensington. During his long and honourable career he made many friends, to whom his death must be a sad loss.

5. "Monograph of the Lepidopterous Genus *Castnia* and some allied Groups." By J. O. Westwood, Esq., F.L.S.

6. "On the Subfamilies Antichlorinæ and Charideinæ." By A. G. Butler, Esq., F.L.S.

7. "On *Valencinia Armandi*, a new Nemertean.' By W. C. M'Intosh, M.D., F.L.S.

OBITUARY NOTICES.

Nathaniel Laurence Austen was elected a Fellow on the 20th of January, 1870. He died on the 9th of August, 1874, from the effects of a fall from his horse, in the 28th year of his age.

William Beattie Booth was a native of Perthshire, and was educated in the art of gardening at Scone Palace, under his uncle, Mr. Beattie. When about twenty years of age, in February 1824, he entered the garden of the Horticultural Society, at Chiswick, as a labourer in the arboretum department, and was transferred in August of the same year, as an under-gardener, to the experimental department. While employed at Chiswick he assisted Dr. Lindley in laying out the garden, and also in planting the trees forming the arboretum. In July 1825 he was appointed garden clerk, which post he occupied for several years. During this period he commenced the meteorological observations for which Chiswick afterwards became renowned; and these were continued by him up to June 1830, when they were taken up by the late Mr. Robert Thompson. In 1830 he assisted Mr. Alfred Chandler in the publication of his 'Illustrations of the Camellieæ,' which was published in numbers, the drawings being made by Mr.

Chandler and the descriptions by Mr. Booth. In 1830 Mr. Booth went to Carclew, as gardener to Sir Charles Lemon, Bart., and new kitchengardens, with flower-gardens and shrubberies attached, were formed under his direction. During this period Mr. Booth's name frequently appears in the 'Botanical Register' attached to descriptions of new plants flowered at Carclew, and which he communicated to Dr. Lindley. Amongst other now familiar plants *Echeveria secunda* was thus named and first described by him, the description appearing in the 'Botanical Register' for 1838, and a figure in the volume of the same work for 1840 (t. 57).

Mr. Booth continued to superintend the gardens and estates at Carclew until 1853. In 1858, in consequence of the death of Dr. Royle, certain changes were made in the official staff of the Horticultural Society. At that time Dr. Lindley was appointed to succeed Dr. Royle, while the post of Assistant-Secretary was handed over to Mr. Booth, who for some few years thereafter conducted the business arrangements of the Society with an ability and courtesy which did much to make the Society popular. On the removal of the Society to South Kensington the increased business incidental to the more enlarged operations of the Society —now the Royal Horticultural—was too much for Mr. Booth's failing health, and he consequently resigned his post. He afterwards lived in retirement, but continued his services to the Society as a member of the Floral Committee, at which, however, his attendances, owing to infirmity, were few.

Mr. Booth was elected an Associate in 1825, and died on the 18th of June, 1874, at the age of 70.

Mr. Thomas Corder was elected an Associate on the 15th of January, 1833, and died on the 15th of October, 1874.

Dr. Bhau Dajee was born in 1823, in the village of Manjeren, near Sawunt Warree. His parents were in poor circumstances, and when he was about seven years of age they came to Bombay, bringing him with them. He was first placed in the native Education Society's Schools in Bombay, and afterwards went to the Elphinstone College. There he took a foremost place amongst the scholars, and was noted for his ability and unremitting application to his studies. The highest scholarships were taken by him, and he was specially rewarded with a gold medal. When his studies were concluded he was appointed Assistant Professor of Chemistry

The figures in this work combine botanical accuracy with pictorial beauty in an extraordinary degree, while at the same time there is no uncalled for attempt at striking effect. C. japónica variegàta, the Waratáh, and the apple-flowered, are exquisitely beautiful specimens. It is highly creditable to the gardening profession that there should be found two young men, the one an assistant in his father's nursery, and the other with no pretensions beyond those of a good gardener, and who, we understand, has actually accepted the situation of head-gardener to a gentleman, capable of producing such a work. It is true that the one, from having been born in a nursery famous for its camellias, and the other, from having had an excellent school education in Scotland, having been bred up under one of the best kitchen-gardeners in that country, Mr. Beattie of Scone, and having been long first gardener and afterwards clerk in the Horticultural Society's garden, have had extraordinary advantages; but how frequently are such advantages comparatively neglected! We are proud to see such young men growing up to succeed us in the world, and think we feel almost as much interest in them as if they were our own sons. To all who can afford to purchase such a work we most heartily recommend it. It is sold at much too low a price to afford the authors any profit, but we hope they will meet with sufficient encouragement to save them from pecuniary loss.

BOOTH William Beattie.

Effects under £3,000.

18 July. The Will of William Beattie Booth late of Spring Villa Gold-Hawk-road in the Parish of Hammersmith in the County of **Middlesex** Gentleman who died 18 June 1874 at Spring Villa was proved at the **Principal Registry** by Frederick Besch of 11 Hanover-street Hanover-square in the said County and Henry Joseph Dowden of 281 Vauxhall-Bridge-road in the said County Gentlemen the Executors.

BOOTHBY { **The Reverend Evelyn.**

Effects under £3,000.

10 July. Administration of the effects of the Reverend Evelyn Boothby late of Whitwell in the County of **Derby** Clerk who died 24 May 1874 at Coombe Bury near Kingston-on-Thames in the County of Surrey was granted at the **Principal Registry** to Margaretta Jane Boothby of Whitwell Widow the Relict.

BOOTHROYD John.

Effects under £1,000.

20 April. The Will with a Codicil of John Boothroyd late of Cliff Cottage Holmfirth in the County of **York** Gentleman who died 27 February 1874 at Cliff Cottage was proved at **Wakefield** by George Tinker of Hepworth in the said County Gentleman and Charles Tinker of Corner's Well Farm Penarth Cardiff in the County of Glamorgan Farmer the Executors.

BOOTHROYD Joseph.

Effects under £2,000.

2 July. The Will of Joseph Boothroyd formerly of Broomhill but late of 115 Crookes-road both in Sheffield in the County of **York** Cabinet Case Maker who died 9 June 1874 at 115 Crookes-road was proved at **Wakefield** by Ann Thorpe of 115 Crookes-road Spinster the sole Executrix.

BOOTHROYD Joshua.

Effects under £800.

19 November. Administration of the effects of Joshua Boothroyd late of Mill-lane Bowling in the Parish of Bradford in the County of **York** Iron Merchant who died 26 October 1874 at Mill-lane was granted at **Wakefield** to Elizabeth Boothroyd of 137 Mill-lane Widow the Relict.

BOOTHROYD Sarah.

Effects under £100.

18 April. Administration of the effects of Sarah Boothroyd late of Upperbridge Holmfirth in the County of **York** Widow who died 28 February 1874 at Upperbridge was granted at **Wakefield** to Helen Hallas (Wife of Elliott Hallas, Gutta Percha Dealer) of Upperbridge the Daughter and only Next of Kin.

BOOTHROYD William.

Effects under £200.

23 July. The Will of William Boothroyd late of Stockport in the County of **Chester** Power Loom Overlooker who died 9 July 1874 at 10 Club-row Daw Bank Stockport was proved at **Chester** by Betsey Boothroyd of 10 Club-row Widow the Relict the sole Executrix.

BOOTLE John.

Effects under £300.

15 May. Administration of the effects of John Bootle late of the Parish of Ashton in Mackerfield in the County of **Lancaster** Beerseller a Widower who died 13 March 1860 at Ashton in Mackerfield was granted at the **Principal Registry** to Robert Bootle of Ince in Mackerfield in the said County Collier the Son and one of the Next of Kin.

Bowie, James (*c.*1789–1869), gardener and botanist, was born in London, son of an Oxford Street seedsman. From 1810 he was employed at the Royal Botanic Gardens, Kew. In 1814 he was chosen by Sir Joseph Banks, with Allan Cunningham, to collect plants for Kew, and set sail for Brazil with the promise that he would enjoy 'the afternoon of life ... in ease, comfort, and respectability' (Banks to Bowie, 18 Sept 1815, RBG Kew, 'Kew collectors'). He was ordered two years later to South Africa, where he arrived from Rio de Janeiro in November 1816. He explored the Cape, travelling by 1821 as far east as the Great Fish River. In 1823, however, he was recalled home and dismissed. In part this was due to 'liberal tory' fiscal retrenchment, which in 1822 halved the sum which parliament had annually voted since 1814 for Kew's botanical collectors, but Bowie was also thought to have been dilatory in crown service. He certainly gave false locations for plants, perhaps to ensure that, when his poorly paid and dangerous post finished, his services would remain valuable. He returned permanently to the Cape in 1827, writing that it offered a quality of life 'which did not often fall to the lot of the working classes in Europe' ('Relative merits of the Cape, America and Australia for emigration', *Gardener's Magazine*, 7, 1831, 490–96).

Bowie wrote the earliest guide to the Cape flora printed in South Africa (1829), and his botanical knowledge was famous: he was thought able to identify any plant presented to him, giving its local and Latin names, history, and uses. He advised on gardens, notably Baron Ludwig's botanical collection, and hunted plants with such success that W. H. Harvey considered him to have enriched Europe's gardens with more succulents than any other individual. His feats were honoured in the genera *Bowiea*, named by Harvey, and *Bowiesia*, named by R. K. Greville, but he enjoyed few more tangible rewards, growing old in poverty, an alcoholic dependent on charity. He died at Claremont, outside Cape Town, Cape Colony, on 2 July 1869.

Robert Bowie

We give to-day the portrait of a gardener whose name has been for a very long period familiar in the gardening world—Mr. Robert Bowie, the highly respected gardener at Chillingham. His horticultural training and subsequent fields of operation are well set forth in the accompanying autobiographical notes: —

I was born August 29, 1817, at Hepburn Bell, one of the home farms of the Earl of Tankerville, of which for several years my father was manager, previous to coming to Chillingham as bailiff. He died there, much regretted, before I was ten years of age, but a good and kind mother was spared to me for thirty years after.

At the age of twelve years I was by his lordship ordered employment in the gardens during the summer, and in winter I was to continue at school until I was sufficiently educated. This I did the first year, but when the next summer was past my master (Mr. Guilfoyle) objected to my going to school in the winter. What education I afterwards got was at the night-school, to which I went regularly every winter until I was twenty-one. At first my work was anything but easy in the kitchen garden. When I got more strength I was sent with the men to assist at whatever was going on either in the gardens or outside grounds. At that time many alterations were being made both in the park and out of it. One thing very much in vogue then was removing large trees from one part of the place and replanting them in another, for the purpose of producing an immediate effect; also the making of roads, drives, and walks, in various directions. A new flower garden was laid out, and the grounds around the Castle very much enlarged.

Mr. Marshall, who for a long term of years previous to Mr. Guilfoyle coming, had been gardener, and also had the management of all the woods, made a new kitchen garden further from the Castle than the old one had been; some of the houses and all the inside walls for fruit trees were built and the trees planted in Mr. Guilfoyle's time. With him I served more than five years, until he left.

Mr. Brown succeeded him as gardener, and under him I had charge of the houses, pits, and frames, and likewise of the trees against the walls, &c., and assisted occasionally at any other work that was on hand. After being with him three years, I was engaged by a brother of Mr. Moffatt's to go to Clumber, but his lordship by some means got to know that I had done so, and objected to my leaving here; and from the kindness my mother had received at his hand from the time of my father's death 1 felt obliged out of gratitude to comply with his request.

After continuing on here for some time, I at last became tired of my situation, as I was making little or no progress in learning the business of a gardener, which long ere that I had determined to follow. I wrote to his lordship, thanking him for all the kindness I had received from him, and also informing him that I now intended looking out for a situation in which I might have an opportunity of further improvement. In a few days he wrote for me to come to Walton-on-Thames, which, on the death of the Dowager Lady Tankerville (his mother), had come into his possession. I need not say how willingly I responded to his request. Here I was put by Mr. Richardson to assist in the houses. On first looking through them I was almost ashamed to acknowledge my ignorance of nearly all the plants that they contained, having previously had little or no opportunity of learning the names of anything but hardy herbaceous plants, trees and shrubs. However, by the time I had been there twelve months I not only knew the names of most of them, but had also acquired some knowledge of the treatment they required. Mr. Richardson had in his day been an excellent plantsman, but at that time his memory was very much impaired; still for his years it was the best I ever knew. I had not been many days there when I was told by one of the men that he would not tell me the name of any plant twice, and as the most of them were without labels, I was under the necessity of asking him the names of those which the foreman could not tell me. On one occasion I had forgotten a name he had told me, and after several weeks I again asked him what it

was, when he very quietly said, 'I have told you that already,' and then walked away. I never more asked him the name of any plant a second time, but as soon as possible after he had told me, wrote it down, either on paper, or if I happened not to have any in my pocket, on the inside of the 'peak' of my cap. '

I had not been long there before I got the wall trees to look after; many of them were very old, but they produced large crops of good fruit, particularly of Peaches, Apricots, Pears and Grapes. Neither before nor since have I seen such good Muscadines as these were, and in such large quantities. As soon as the berries were fairly formed the bunches were thinned, and then put into bell-glasses that had been made for that purpose. One side of the glass was quite flat, with a small hole near the top, at which the bunch was introduced to the inside; it was then fastened by a string round the knob of the glass to a nail in the wall, and then a piece of fine canvas was tied over the mouth, and there the bunch remained secure against either weather or insects, until it was thoroughly ripe. Before frost set in what had not previously been cut for use were taken out and hung on wires inside cupboards in a small house with a glass front, in which was a flue for the purpose of excluding frost. Before they were all used some were a good deal shrivelled, they were, however, well flavoured, and of a golden hue.

By far the best plants in the houses were the Palms in the large stove. They had, however, got very much too large for the space allotted them, and not wishing to enlarge the house his lordship made a present of them to the Duke of Devonshire to help furnish the large conservatory at Chatsworth, In the summer of 1840 I assisted at the taking up and packing of them, which at that time was considered rather a hazardous undertaking, Many gardeners came from a considerable distance to see the operations when we were busy with them. Mr. Paxton was most particular in having every root saved, in order that their removal might be successful. We were a long lime over the job; they were, however, well worth taking every pains with, for they were really splendid plants, and afterwards did well. Some time after they had been got safely to their destination, Mr. Paxton returned to Walton to settle accounts. After giving us young men (there were three of us) very handsome presents in money, he also presented each of us with a copy of his Botanical Dictionary, which at that time I valued highly, and often afterwards consulted when uncertain as to the correct spelling of names.

Mr. Richardson was a good practical gardener and strict disciplinarian, but if a young man attended to his duty he was a kind master. When the alterations were going on at Chillingham, he was in the habit of coming down for a month or two every year, when his lordship was here, for the purpose of giving his advice when anything particular was in contemplation, and to him the credit is due for many of the improvements made at that time,

Things went on very pleasantly with me during the time I was with him, and when he thought that he had not a chance of teaching me much more, he very kindly recommended me to Mr. Toward, manager to Her Royal Highness the Duchess of Gloucester, at Bagshot Park, and to him I went in the spring of 1841, and was employed in the kitchen garden. I had not been long there when the foreman left, and I got that situation, Bagshot was then an excellent place for a youngman, gardening in every department being pretty well carried out . The demand for fruit and vegetables for the supply of Her Royal Highness' establishment, not only when at Bagshot, but also when in London, was something considerable; and the garden not being of great extent, we were under the necessity of keeping that part devoted to the production of vegetables nearly always under crop. No sooner was one variety cleared off than the ground was prepared for another. Of fruit we generally had a fair supply of all the hardy sorts, and, for the number of houses, rather more than an average quantity of forced fruits. Pines (mostly Queens, during the time I was there) were well grown; and Mr. Toward informed me the year after I left, that my succession plants had produced heavier fruit than any he had

ever had. The chances which young men there had of learning were highly favourable; not only was Mr. Toward well up in his profession, but he was also most willing to communicate what he knew to those under him. There were also the nurseries of Mr. John Waterer and Mr. Standish at Bagshot, at each of which the young men from the Park always got a kind reception. Many a "wrinkle" we picked up in them during our evening rambles. For the greater part of the time that I was there Mr. Standish's was my "home house," where, when at liberty, I generally spent the evening.

I had only been with Mr. Toward about two years when, in the autumn of 1842, I was requested by the Earl of Tankerville to come to Chillingham, to take charge of the gardens, &c., and accordingly I took farewell of Bagshot and the kind friends I had there, and returned here—and here I have since remained. I have but little more to tell. This, however, I can say: that I have always endeavoured to do my duty not only to my employers, but also to those under me. No doubt I have made some alterations and additions in the grounds and gardens, and I wonder who would not have done so during the time that I have "had the management of them. I have perhaps done more by way of ornamenting "the home of the wild cattle," the park, than in any other department. The hardier varieties of Conifers have been planted rather largely, and are now many of them fine specimens. I have also added some plantations of useful forest trees to those formerly on the estate.

After the death of the late Earl of Tankerville I was continued in my situation by his son, the present Earl, and have invariably been treated with great kindness by my employers and all the members of their family."

Obituary.

ROBERT BOWIE.—We regret to announce the death of Robert Bowie, which occurred at Wooler on Sunday, Sept. 1, whilst saying grace at dinner. The deceased was born August 29, 1817, at Hepburn Hall, one of the home farms of the Earl of Tankerville, of which for several years his father was the manager, previous to going to Chillingham as bailiff.

He commenced his career as a gardener at Chillingham during the life of the present Earl's grandfather, and at the request of the then Earl Tankerville he removed to Walton-on-Thames, occupying the position of foreman, where he took every opportunity of improving himself in the profession he had taken up. On the death of the head gardener at Chillingham, Mr. Bowie was appointed in his place, fulfilling his duties with satisfaction to his employer and credit to himself for over 45 years. During this long term of service, many improvements were carried out by Mr. Bowie, in conjunction with the late Earl, not only in the gardens, but also in Chillingham Park and Hepburn Wood, which were planted by them—forestry being a hobby with both Mr. Bowie and the late Earl. Subsequently Mr. Bowie acted as bailiff, his son Thomas succeeding him as head gardener. Finally he retired in 1885, and removed to Wooler, where he continued to take an interest in gardening matters. When at Chillingham he was a successful exhibitor at Alnwick and other shows, and his services were greatly in demand at many of the horticultural and floral exhibitions in the north. The interment took place at Chillingham.

Mr. Bowie had been a subscriber to the *Gardeners' Chronicle* all his life, doubtless therefore since the founding of the *Gard. Chron.* in 1841, to which he occasionally contributed. He was much interested in the crossing and hybridising of plants, and among others he raised Lobelia Little Gem, which was awarded a First-class Certificate by the R.H.S. The collection of Conifers formed at Chillingham Park during Bowie's career there was an extensive one, and many of the specimens, thanks to his fostering care, have grown to large dimensions. Those who may wish to have fuller particulars of Mr. Bowie's life, as here given, should turn to our issue for March 4, 1876, p. 300, where also a portrait is given.

THE GARDENS OF SIR ROBERT HARVEY, BART.

Interview with Mr. H. Bowyer, at Langley Park, Slough.

EARLY in the season, by courteous permission of Sir Robert Harvey, I had the opportunity of visiting Langley Park Gardens. Though only a few miles from Slough, Sir Robert's historic seat is in the very heart of the country, the park itself, with its three entrances, being very extensive, as well as very finely timbered.

"We have not much glass," said Mr. H. Bowyer, the head gardener, who showed me round, "the principal features being outside."

But the winter garden, which, of course, is not outside, must be included amongst the features. Here, at the outset, we spent some time, and in expressing admiration of the splendid Tree Ferns, and the picturesque general appearance, I asked when the building was erected.

"Fifteen years' ago," replied Mr. Bowyer, "by Messrs. Pulham. Most of the Ferns are natives of New Zealand. The rockery is planted with Ferns in variety, and Rex Begonias."

"Bamboos seem to do extremely well."

"Yes, they are varieties from foreign countries, which would not, however, flourish outside. The Bananas (Cavendishii) are grown solely for decorative effect. Clivias are put in pots in the beds, and give blooms for quite a month. The Fuchsias on the wall thrive. Both Charming and Mrs. Marshall are planted out. So far as flowers are concerned, we vary the contents of the corridor constantly. Cinerarias (stellata), Schizanthus, and Pelargoniums are favourites for embellishment, and, as you see, we make free use of baskets of Asparagus Sprengeri and Nephrolepis Ferns. The Fern wall was only finished a fortnight ago, but the plants are breaking beautifully."

Terrace Bedding.

"Do you plant bulbs in the terrace beds of which the Italian well forms the centre?"

"No, Myosotis in mass, Wallflowers (Blood-red) at the corners, and Wallflowers (Golden Queen) inside. For summer bedding, there is a different arrangement every year. This year the combination consists of Geranium Paul Crampel, Fuchsia Mrs. Marshall, and a groundwork of yellow Pansies, with an edging of blue Lobelia. We use Paul Crampel also under the Palms; it cannot be beaten for colour. The beds beyond are filled like the terrace beds in spring, but in summer they differ, some having Abutilon Thompsonii as dot plants, with a carpet of Salvia Star of Zurich; others, Abutilons with a groundwork of Begonia semperflorens; and one Grevillea robusta, with a groundwork of Begonia Count Zepling."

"There are many fine trees on the lawns, but they are overshadowed by the magnificent Cedar."

"That Cedar is probably the biggest in England, and a number of trees have grown from the parent. Tons of cement have been used to stop the sap, and it is propped up all round by chains. Beyond this, nothing has been done to it. Near the Cedar is a bed of Pink Pearl Rhododendrons, which was made in the spring of 1908."

PINK PEARL RHODODENDRONS.

"They have made amazing growth. How did you manage it?"

"We took out all the original soil to the extent of three feet, and put in loam, peat, leaf-soil, and plenty of sand. The plants will have enormous balls when they are lifted."

"What is the nature of the natural soil?"

"Good loam on gravel. Our chief enemy is the north-west wind, to which we are badly exposed. There are Ericas mediterranea alba in the Pink Pearl bed. Two years ago I treated Azalea mollis and Ghent in the same way as the Rhododendrons, with equally satisfactory results."

Noting the grand Chestnuts, the avenue of Oaks, a lake nearly a quarter of a mile long; a Dutch garden with a scroll in Box, the fourteen beds being filled with Polyanthus in self-colours, and Myosotis in spring, and chiefly Asters and Stocks in summer, we made our way to the extension which at the time of my visit was being carried out.

"Here," said Mr. Bowyer, "is the first bit of rockery, sheltered from the north-west wind by hybrid Rhododendrons. The shrubs include Rhododendron Little Gem, Japanese varieties of Azaleas, which give masses of white flowers, Daphnes, and Cotoneasters. Now we come to the aviary garden."

A Great Collection of Hardy Ferns.

"The aspect of this also is north?"

"Yes, it faces north, and the absence of sun renders it an ideal spot for hardy Ferns. There is a representative collection of birds in the aviary."

"And I imagine of Ferns in the Fernery?"

"The best varieties of British Ferns are certainly growing here, and in the Fernery there are between five and six hundred plants. Among the principal families are the Blechnum, the Asplenium, the Lastrea, the Woodwardia, the Polypodium, and, of course, the Royal Fern. There are, roughly speaking, ten to a dozen of each variety. The wall covered with Ivy forms a suitable background, and the paved walk, with grass at the side, combines the convenient with the ornamental."

"Then, there is the bedding in the groups."

"Both in beds and on the wall, choice shrubs are the leading features. For instance, here is a bed of standard Maples, Acer dissectum, trained; next to it is a bed of Acers not named; and the third is occupied with Cedars atropurpureum dissectum. On the wall we have Camellia reticulata, which has the largest flower; it is the size of an ordinary saucer, crimson with a yellow centre. An entire border is devoted to Camellias in variety. This border was remade on the same principle as the border with Rhododendrons and Azaleas."

Shrubs for Wall Decoration.

"You might mention the names of some of the varieties?"

Digitized by Google

Public Domain in the United States, Google-digitized / http://www.hathitrust.org/access_use#pd-us-google

"C. Madame La Bois, Augusta superbum, and latifolia. The last we have been trying on the wall for twelve months. The other shrubs include Cornus in variety, Embothrium coccineum, Muehlenbeckia complexa, Exochorda, Albertii, Cæsalpinia japonica, Berberis of sorts, notably B. Wilsonii, passiflora, Vitis in variety, Pittosporum in variety, Ceanothus, Xanthoceras sorbifolia, Viburnums in variety, Fabiana imbricata, Nandina domestica (a Japanese plant), Crinodendron Hookeri, Actinidia chinensis (most useful as a pillar plant, very fine in the leaf), and Aralia mandschurica fol. argenteo-variegata."

The Museum Garden.

"You appear to have another special garden adjoining. Have you a name for it"

"We call it the 'Museum Garden,' because it adjoins the museum. Here are many interest you to know that from October to April we cover over the fine specimen of Gunnera manicata; the leaves are nearly nine feet across. We grow the Japanese plant, Petasites, for the sake of the foliage, which is very effective. A bed worthy of mention is devoted to Colletias; the varieties are C. cruciata, and spinosa (karida). The two new varieties of Kniphofia, Tysonii and Northii, do well here; also several varieties of Magnolia, Cytisus, Stuartia, Escallonia, and Ceanothus. The Bamboo garden proper adjoins the Japanese garden."

"With splendid clumps of Metakes."

"I attribute their success to good feeding and regular watering; these are vital conditions in the cultivation of Bamboos. Phyllostachys mitis is very fine; in Japan it reaches fifty feet in height. Andromedas in variety are a feature of this garden; and two of the finest of the semi-this part of the grounds is eighteen inches, and even two feet high. I suppose that altogether there is a mile of Box in the gardens."

"You also seem to have a herbaceous garden."

"This is separated by a Yew hedge from the kitchen garden. It was only made last year. There are two wide borders, and a figure in the centre, while on the other side, is a narrow border, protected by a high wall."

"Even with encroachments on the kitchen garden, it has not been denuded of flowers."

"No, but before we look over the kitchen garden, we had better have a stroll through the Pinetum."

"The Pinetum is on a very large scale, and its borders are apparently not less interesting than its specimen trees."

"It is upwards of twelve acres. Lately, the borders have all been renewed. We took out eighty loads, and put back one hundred

ULMUS MONTANA PENDULA—THE WEEPING MOUNTAIN ASH.

named Himalayan Rhododendrons, such as Thompsoni, campylocarpum (sulphur-yellow), Aucklandii, and Shilsonii (deep crimson), a very choice variety, which did not flower for several years. Several Himalayan varieties do not flower for years after they have been planted. Then, there are R. Hodgsonii, Gill's Triumph, Falconeri, kewensis, Goliath, Mrs. H. Shilson, barbatum, campanulatum superbum, and Fortunei. Opposite to these are Camellias Noblissimum and Sieboldii Tricolor. Later on, both Rhododendrons and Azaleas are interspersed with Gladiolus Brenchleyensis, which make a good show in August. Box edging is a feature of the gardens."

"With regard to Bamboos," continued Mr. Bowyer, "the hardy varieties flourish in the Japanese garden, which we are now entering, especially Arundinaria Simoni, A. Simoni striata, A. Hindsii, and A. nitida, Phyllostachys aurea, and several clumps of Metake."

"Is the Lily pond filled with named Nymphæas?"

"Yes, with the best, such as Gladstoniana, atropurpurea, and chromatella. It may deciduous shrubs are Ligustrum ovalifolium and sinense."

The Making of a Herbaceous Border.

"Judging by the Yew hedge walk, Yews are very much at home."

"We have lately started different figures, which are making good progress. Here, too, is a new herbaceous border, with quite a thousand clumps of flowers. The border itself is ninety-seven yards long, and eighteen feet wide."

"You are invading the kitchen garden to add to the pleasure grounds?"

"Practically that is so. With regard to the border, which you notice is raised, and on a slope, we put two hundred and fifty loads of soil upon it, loam, leaves, sand, and manure. The clumps are arranged so as to harmonise in height and colour. On the poles at the back are Vitis in variety, but there will also be at the back, running right along the whole length of the beds, a rockery containing the best Alpines; and on the outer row of wires, Clematis and Garrya elliptica. There will also be a large bed of Japanese Pæonies. The Box edging in and ten of fresh material. The soil was too heavy for the plants. One of the most successful of the borders consists of hybrid Rhododendrons, with Liliums interspersed, the latter embracing all the finest varieties. The Lily pond facing this border, with Gunnera on the bank, contains some choice Lilies, including N. Elliottiana, N. Frœbellii, N. sulphurea, N. rosea, and N. carnea."

"I observe that you have another great border edged with Ericas."

"Yes; there is almost every variety of Heath, and the border itself is one hundred and twenty yards long. With a background of Laurels, the flowering and other shrubs comprise Berberis in variety, including Thunbergi, Knightii, and stenophylla, Photinia serrulata, Cydonia japonica. Escallonia Phillippiana, Clerodendron trichotomum, Buddleia variabilis, Andromedas in variety, Potentillas, Olearia Haastii, Magnolia Thompsonii, and Veronica Le Sedinsante."

"There are beds as well as borders?"

"Yes, a number, including a bed of Heaths and another of Azalea Evergreen, with standard

Original from CORNELL UNIVERSITY

trees of weeping Peaches. Further flowering and foliage shrubs are Desfontainia spinosa, Stuartia pseudo-camellia, Staphylea, Carpenteria californica, Weigela Eva Rathke, Choisya ternata, Solanum crispum, Philadelphus coronarius, and Grevillea sulphurea. Near the handsome Grape gate is a large bed of Maples; and another bed of Maples has a groundwork of Camellias and Berberis japonica, with Lilies, edged with Ericas. Facing this is another Lily pond, and a bank of Bamboos, with Bambusa palmata at the back."

Sweet Peas on Wooden Espaliers.

Returning to the kitchen garden, I was surprised with the Sweet Peas trained on wooden espaliers, and asked how long the system has been in operation.

"For several years. There are three long rows, which were planted out from pots a foot apart, on the 30th of March. We use little sticks, and tie them up. The ground is trenched every year, and a quantity of manure used. Narcissi in variety are planted in between for spring flowering."

"Then there are the Roses?"

"Of which there are about a hundred varieties, standards, half-standards, and dwarfs. We put the standards seven feet apart, with a dwarf between, and two rows of dwarfs in front. The Rose border is one hundred and twenty yards long, and the trellis from end to end is decorated with Lady Gay. Among the best Roses is Princess Ina. Behind the Rose border are Apples on espaliers."

"Have you any specialities in hardy fruit?"

"Enormous crops are obtained from the south row of Raspberries (Superlative), ninety yards long. In one Strawberry border, we grow Givon's Late Prolific, Waterloo, and Laxton's Fillbasket; and in another, Royal Sovereign, and Bedfordshire Champion. Strawberries are planted a foot apart the first year, and though in the second year every other plant is taken out, a good bed still remains."

"You have a number of Peach trees on the walls."

"Some of these we are doing away with, and putting in standard Plums to take their place. No forcing of vegetables is done, but we get good crops of Peas and Broad Beans; also of Asparagus, from six beds; Brussels Sprouts, to be followed by Celery; Onions, and Cabbages of all kinds."

The Treatment of Mangoes.

"There remain the fruit ranges and plant houses."

"As I said at the outset, they are not on at all a large scale. The Vinery we are now entering was only planted a year ago, but the Muscats and Princess of Wales are breaking well. Orchids are chiefly Cattleyas, but a Vinery has lately been converted into a house for Tree Carnations."

"What are the varieties?"

"Britannia, Mrs. Burnett, President Roosevelt, Oriflamme, White Perfection, Enchantress, Lady Bancroft, and others. The Malmaisons include Mrs. Trelawney, Mrs. Martin Smith, Maggie Hodson, Mrs. Stratford, Princess of Wales, Duchess of Westminster, and Lady Carnations."

"But I have not seen your famous Mangoes, for which Sir Robert Harvey was awarded a Banksian medal by the Royal Horticultural Society."

"They are in the next house. The tree has forty fruits on it. Mangoes ripen in July, and they are picked in August. Stove heat is required, and plenty of nourishment after the flower is set. The tree also needs to be thoroughly and often syringed. The fruit is good both in colour and in flavour, yellow flesh and very rich. It should be cut out like a Melon, and the stone is nearly as large as the fruit." ALFRED WILCOX.

THE gardens of an Amateur Border Carnation Exhibitor at Grange Dene, Woodside Park, will be described next week.

The Amateur's Frame.

XIII.—VIOLETS IN A FRAME.

THE amateur who lives in the precincts of a large manufacturing town is not advised to undertake the culture of Violets in a frame, for they seldom do well; but where the air is clearer, and more light can be obtained, these fragrant flowers well merit good cultivation.

It is very opportune now to treat of Violets, for the present is the time when they should be removed from the garden plot and planted in a frame. This may be done at any time in August or September, but the middle of the latter month will in most cases be found convenient, for many winter-flowering plants which have been grown in frames during the summer will now need warmer quarters, so that the frame will be set free in that respect.

Preparing Violets for Frames.

It is the usual plan, where Violet culture in frames is made a feature, to split up the old plants in April or May, and to plant them in good soil in a semi-shady part of the garden, such as behind a north wall or between rows

Violets in a frame

of Scarlet Runners. The north border is without doubt the best position, though the same ground should certainly not be repeatedly used for the purpose. The value of a north wall has certainly been appreciated this year, with the scorching sun and continued dryness. Certainly, those who have endeavoured to grow Violets without partial shade during the summer must have had prodigious labour in keeping them syringed and free from red spider, or they have proved a failure; and I fear this has generally been the case.

The care during the summer—not only during an abnormally dry period, but also at other times—consists of frequent hoeing between the plants, syringing each afternoon in such a way as to get well beneath the leaves, and an occasional dressing of fertiliser or guano. If treated in this way and never allowed to suffer from dryness, there is every prospect of having good plants ready for setting in the frames in August or September.

Preparing the Frame for Violets.

Violets, we know, are hardy, but they cannot be had in flower during the winter unless they are kept free from frost and from excessive wet. Hence a brick frame or pit is best, but if only a wooden one is available it would be well to set linings around it in the manner explained in a previous article (page 360), and to fill the space with ashes, but preferably with heating material such as leaves, stable litter, or a combination of the two.

No great heat is required for the forcing of Violets, and anything in the way of a hotbed is to be deprecated. Thus the material should have but a small proportion of horse droppings, and should be trodden down so as to furnish a depth of about fifteen inches. Over this should be put about eight inches of good, rich soil, composed, if possible, of turfy loam, leaf-soil, Mushroom manure, cow manure, and mortar rubble. The loam, leaf-soil, and manure should stand in the proportion of three, two, one, but the amount of cow manure and the mortar rubble must depend on the character of the loam. A close loam will need less cow manure and more mortar rubble than an open loam. Where plenty of leaf-soil is at hand, a layer of this might advantageously be spread over the heating material before the soil is put on. The frame should be so set, and the soil and material so managed, that when the Violets are planted, their leaves will just miss touching the glass by three inches.

Planting the Violets.

The Violets will not, of course, make a deal of growth while they are in the frame, so fairly close planting is recommended. About eight or nine inches from centre to centre of the clumps should be ample, but a better guide is to set them so that the leaves just miss touching. When lifting from the ground care should be taken not unduly to disturb the roots. This can best be accomplished by keeping as much soil as possible on the clump.

After planting, a good watering should be given, and the lights might be kept on for a few days; but afterwards plenty of air should be allowed on all possible occasions, and the lights might be drawn right off on warm, sunny days.

To keep the plants in good health throughout the winter, plenty of ventilation is essential, also freedom from frost, which will necessitate the lights being covered on frosty nights with mats or litter. The removal of all decayed and decaying leaves, and the frequent stirring of the soil between the plants, are details essential to success; and to these may be added the counsel never to allow the plants to suffer from dryness, but to water only when needed, and as far as possible on warm mornings.

WILLIAM F. ROWLES.

Two Uncommon Tulips.

THE pretty Tulip, often called the Chitral Tulip, is a gem for growing in a position where it can be left undisturbed for a time. It is also known as the underground running Tulip, as the stolons run in various directions under the soil, and thus spread in a short time to a considerable extent. Anyone who has noticed how Lily of the Valley spreads will understand clearly what I mean by saying that this is an underground running Tulip.

A point in its favour is its easy culture. It gives the cultivator no trouble, and certainly rewards him with a beautiful display of chaste blossoms. In clusters on rockeries, especially low rockeries, these Tulips look charming.

Tulipa Clusiana, commonly known as the Lady Tulip, is another fit subject for the rockery. The colours are purple-crimson and white, with a black centre when the blooms are fully expanded. The white borders the edges of the petals, and when viewed from a short distance the flowers look like so many Union Jack flags. The points of the petals turn outwards gracefully, thus taking away all appearance of stiffness. When planting, be careful not to use any fresh manure. Old potting soil is useful. G. G.

THE best time to kill weeds is just as the seeds are germinating, or while they are yet very small. When this is done, but little moisture is lost through them, and they render but little plant food insoluble. In the thorough and early preparation of the seed-bed many weeds are destroyed by killing them just as they are coming up.

THOMAS BOYD.—The many friends of Mr. Thomas Boyd, the well-known and much-respected gardener to W. Forbes, Esq., of Callender Park, Stirlingshire, will be grieved to learn of his sudden decease at the age of fifty-five years, on Monday, March 19. Our friend and neighbour had not been quite well of late, but there was nothing to indicate that his end was near. As exhibitor or judge, Mr. Boyd was most courteous, and his unassuming manner rendered him very popular. He was a native of Hopetoun, near Edinburgh, and from early life had excellent opportunities of gaining a good experience in gardening. He soon became a successful exhibitor of fruits, and his large collections and finely-finished Grapes were very prominent at exhibitions. He attended all the international shows in England and Scotland, and returned with many of the best prizes in his possession. He won the Veitch Memorial Medal by showing excellent Muscat Hamburgh, and captured cups and plate in competitions for fruit. For some years, while gardener to Sir W. Wallace, at Lochryan, Wigton, Mr. Boyd gave a capital account of himself as an exhibitor, from there he came to Callender Park, where he has successfully laboured for twenty years, exhibiting much zeal and deep interest in the management of Mr. Forbes' fine gardens. Mr. Boyd has left a widow and large family to mourn his loss. *M. Temple, Carron, Falkirk, N.B.*

to the young caterpillars when hatched, but also gives them a choice of various routes out, so that a larger feeding-ground lies open to them. The nests should be searched for and destroyed while they can be easily seen, a hard brush and a small can containing paraffin

MR. BRADBROOK, AMONG HIS SWEET PEAS.

emulsion being the best means to employ. Any nests on fruit trees should be treated in the same way. If some of them escape notice, the eggs will hatch about the end of April, and the caterpillars, after living for a time under the web—a habit which has gained for them the name of tent caterpillars—will eventually disperse over the trees, and, if unchecked, strip off every leaf. Before they disperse, it is easy to destroy them in the same manner as is recommended for the destruction of the eggs; but after they disperse it is almost impossible to get them all. If the tree is shaken they sling themselves down, but unless the ground is covered with a sheet, most of them escape detection, and presently sling themselves up again. In some cases it might be worth while to cover the soil with fresh lime before shaking the tree.

Solomon's Seal.

December 27th.—I see that Gerard, in his "Herbal," offers some suggestions as to the origin of that curious name, Solomon's Seal. "The roots of ye seale, as Galen saith, have (saith he) a certain kind of astriction or binding and biting withall; and likewise a certain loathsome bitterness, as the same author affirmeth, which is not to be found in those that grow in our climate. Dioscorides writeth that the roots are excellent good for to seale or close up grievous wounds, being stamped and laid thereon. Whereupon it was called Sigillum Solomonis, of the singular virtue that it hath in sealing or healing up wounds, broken bones, and such like. Some have thought it took the name Sigillum of the marks upon the roots, but the first reason seems to be more probable. The root of Solomon's Seale, stamped while it is fresh and green, and applied, taketh away in one night or two at the most, any bruise, black or blue spots gotten by falls, or women's wilfullnesse, in stumbling on their hasty husband's fist, or such like." The "such like," I suppose, is a comprehensive way of referring to hobnailed boots and other obstacles of the same sort. Truly, a most useful root.

The Home of a Poet.

December 28th.—Ward's Hurst (shown in the illustration), where the late Gerald Massey lived, on the Chiltern Hills, for many years, scarcely suggests the home of a poet. But, like most poets, he made very little out of his writings, and it was generously provided for him by the late Lady Marion Alford. There is a fine Cratægus pyracantha on the front, one of the best evergreen shrubs for walls, wonderfully handsome in winter, when it is covered with crimson berries. This year, the show of berries of all kinds is extraordinary.

H. C. DAVIDSON.

The Gardens of Sir Maurice Boileau, Bart., at Ketteringham Hall, Wymondham.

INTERVIEW WITH MR. JOHN W. BRADBROOK.

THE county of Norfolk has no special reputation for lovely gardens, but there are some of great beauty, picturesque in appearance, laid out with artistic taste, and maintained at a standard of remarkable excellence. This is true of the gardens of Sir Maurice Boileau, of Ketteringham Hall, which, by permission of the owner, I visited on a bright morning towards the end of October. The drive from the town of Wymondham, dominated by its grand church, is delightful, and the approach to Ketteringham through a long avenue of trees, is pretty. The charms of the gardens are apparent directly, and Mr. Bradbrook, the head gardener, lost no time in introducing me to the Long Walk, which is one of the features of the extensive pleasure grounds, and forms an attractive approach to the hall. On one side are a score of Crimson Ramblers as festoons of the walk, and a sunk Rosery, with paths running through the centre.

"How many beds are there in the Rosery?" I asked.

SOUTH FRONT, KETTERINGHAM HALL.

"Sixteen, the average number of Roses in a bed being about twenty. The beds are edged with Violas and Asters. The Roses are all Hybrid Perpetuals."

"Which varieties do you find suit the soil best?"

"Baroness Rothschild, Belle Siebrecht, Ben Cant, Magna Charta, Alfred Colomb, A. K. Williams, Duke of Edinburgh, Fisher Holmes, La France, Mrs. J. Laing, Captain Christy, Marie Baumann, Charles Lefebvre, Frau Karl Druschki, General Jacqueminot, Prince Camille de Rohan, Xavier Olibo, Madame Lacharme, Paul Néron, Reine Blanche (Moss), and Souvenir de la Malmaison, which is in flower late into the autumn."

"You have a striking fence of Yews planted behind?"

"It was planted by me forty years ago, and helps, I think, with the two figures representing Britannia, to give variety to the walk. At the end of the grass are beds containing Tree Pæonies, Yuccas, and Irish Yews. The Tree Pæonies give an immense quantity of flowers, some of great size."

"Here you have, too, a very nice specimen of Phyllostachys aurea. There are also the beds on the other side?"

"Of the latter there are half a score, and they are now planted with Tulips, Hyacinths, Ranunculus, and Pansies, some of them being edged with Pansies, and others with double Myosotis and Pyrethrums. Of the oblong beds beyond the Rosery, on the same side of the walk, one has been filled in the summer with scarlet Lobelias in the centre, Geraniums (Mrs. Pollock) at the side, edged with Nemesia strumosa; another with Salvia patens in the centre, Petunias at the side, edged with fibrous-rooted Begonias; and the third with double and single bulbous Begonias in the centre, Carter's Little Star Ageratums at the side, edged with Sutton's Coral Begonias."

A Wall of Fruit and Climbers.

"The wall facing the Rosery is clothed with fruit as well as climbers. I should like the

names of some of these. Are not the Carnations still in flower, in the beds underneath the wall, Sutton's Marguerite?"

"Yes. As to the climbers and fruit, I can give you them pretty well in their order. There are Clematis Jackmanii, Golden Drop Plum,

THE GARDENER'S HOUSE, KETTERINGHAM HALL.

Clematis Tunbridgensis, Thompson Pears, Clematis Wrightii, Marie Louise Pear, Beurré Rance Pear, Coronilla, Rose (unknown). On the ornamental gate out of kitchen garden, Rose (Celine Forestier), Doyenné du Comice Pears, Clematis montana, Pond's Seedling Plums, Clematis, Doyenné du Comice Pears, Conference Pears, Clematis Venus Victrix, Polygonum Baldschranicum, Josephine de Malines Pear, Clematis ascotensis, Transparent Gage, Maréchal Niel Rose, Clematis Rea Jackmanii, Maréchal Niel Rose (white), Red Gloire Rose, Rosemary (trained to wall), Clematis Beauty of Worcester, Ampelopsis Veitchii, and Magnolia grandiflora, which is twenty feet high."

"Now we come to the garden front of the hall with its wealth of flowers, and its ornamental marble vase in the centre."

"There are here two beds which have been filled with Cannas, and two with Fuchsias, edged with variegated Euonymus; these are now planted with Tulips and Hyacinths. Four of the beds have been made up with golden Calceolarias, dotted with Salpiglossis; two with Pentstemons, still in flower; and these we shall leave as they are, edging the whole with Cerastium tomentosa. Then there are two beds with scarlet and yellow Wallflowers, and two more with Pentstemons (all Sutton's strains). Here, too, are some of the best Tea Roses, several being still in flower."

"You might mention the names of the other plants in flower on the 26th of October."

"Carnations, Gladioli, Pyrethrums, Antirrhinums, Lilium auratum, Lavender, Stocks, (Ten-week, and very good this year), and Oxalis Bowiei."

Proceeding to the terrace, where I saw Lady Boileau, and had a gracious reception from her, we noticed The Alcove, filled with Hydangeas and Agapanthus. Entering next the conservatory, I observed:

"You have Camellias still in flower."

"Last year we had so many blooms that we had to thin the buds out. The varieties include Donckelaari, fimbriata, and the Double White. We have given up the Chrysanthemums with big blooms, growing varieties which we find most useful to cut from. The varieties represented in the conservatory are Baron Hurst, Lord Brook, Sunstone, Beauty of Exmouth, Mr. J. Shrimpton, Miss May Church, Madame Carnot, Good Gracious, Mr. de Thirese Ray, Madame E. Roger, and Niveus. The singles are Mary Anderson, Pink Beauty, Mr. Will Gordon, Miss Beatrice Roden, Belle of Weybridge, Ladysmith, Victoria, Ryecroft Belle, and Sir G. Bullough."

"What is your scheme of spring bedding for the terrace?"

The Terrace Bedding.

"Wallflowers (Harbinger, Old Gold, and Ruby Gem) in three rows, and one row of mixed Pansies (Bath's Empress), edged with Cerastiums, and dotted with Narcissi. The groundwork of the corner beds on the terrace consists of Echeverias, with pyramids of Euonymus on either side; these will be dotted with Hyacinths. Along the terrace wall are seven pillars of Ampelopsis Veitchii, with Ivy round."

"I notice that you are beginning to clothe the south side of the hall itself."

"Quite recently I planted Roses—Waltham Seedling, Reine Marie Henriette, Reve d'Or, Cheshunt Hybrid, and Gloire de Dijon; also Bignonia radicans and Pyracantha Lælandi."

From the terrace we strolled towards the lakes, which cover about six acres. In these are numerous tubs filled with Arum Lilies and Bulrushes, and close by is a walk with Irish Yews on either side. On the east of the mansion is the armoury, whose walls are planted with Pyracantha and Ampelopsis, and in this direction I noted several fine specimens of Cedars, Pines, Catalpas, and Thujas.

"Thujas," remarked Mr. Bradbrook, "do better than any other trees, and especially T. Lobbii, but the soil, which has blue clay underneath, does not suit Cedars so well."

"Still, you have some good specimens of C. atlantica," I rejoined, as we returned from the Abbey Walk over the lower lake, to the lawn, "and also of Abies Douglassi."

"As we go along, you will notice many other flourishing examples, and shrubs in great variety. Bamboos and Rhododendrons are among the latter. I have just edged a bed of Arundinaria Simoni with Cineraria maritima, and a bed of Rhododendrons with Sedums. Here is a bed of Aucubas, edged with Funkia Sieboldi."

"Where does the avenue of Limes lead us?"

"To a bridge over the upper lake. In the shrubbery which we are now approaching, variegated Yews are a conspicuous feature. They are cut into various quaint shapes, including corkscrews and cups. The shrubbery is also planted with Hollies, Portugal Laurels, Juniperus, and Clematis Jackmanii on walls. The island which you see from the bridge is planted with Yews, and 'Pokers,' as the Tritomas are called in Norfolk."

Temples and Statuary.

"What is the length of the walk on the other side of the bridge?"

"It is about an eighth of a mile, and has a temple at each end. One was erected in 1849 in memory of Guizet, and the other in 1849, in memory of Hallam, the historian, who were both friends of Sir John P. Boileau, grandfather of the present baronet."

"I must make a note of the pretty recess."

"The statuary represents the four seasons of the year, with a shepherdess in the centre. Just beyond this recess are two noble Oaks, and below them is King Arthur's table, also the monuments of dogs, fourteen in number, who were buried between 1877 and 1907. At the back of a Cedrus deodara is a stone cross with a seat, planted round with variegated and green Ilex."

Then, having explored the Poets' Walk, planted with Yews and Beeches; the bowling green, surrounded by specimens of Cupressus Lawsoniana, and other shrubs; noted a pergola of Hornbeam, with Oak posts and iron top, nearly seventy yards long; some fine Tulip-trees and Wellingtonia gigantea, all planted by Mr. Bradbrook thirty-eight years ago; the Nut Walk" and the "Lion Arch," we came to two rockeries on each side of the lion.

"They are planted with hardy Ferns," I said.

"And also contain such plants as Christmas Roses, Aubrietias, Primula japonica, Saxifrages in variety, Asperula odorata, the Ferns, including the Royal Fern, Osmunda regalis, Osmunda Claytoniana, Scolopendrium of sorts, Angulare Wollastonii, Allasorus Crespus and others. The right-hand side is backed with Rheum giganteum, Ferula communis, Polygonum Sachaliensis, and Arundo donax. On the left hand are Laurels and Hollies."

Herbaceous Borders.

"I conclude that the herbaceous borders are one of the most important features of your outer garden, which we are now entering?"

KETTERINGHAM HALL.

"Yes, they are a hundred and sixty yards long and six yards wide, but before we speak of the herbaceous plants, I may mention that at the back Sweet Peas are grown in clumps.

The best varieties are Queen Alexandra, Henry Eckford, Frank Dolby, Horace Wright, Nora Lewis, E. J. Castle, Enchantress, Phenomenal, Agnes, Eckford, and Earl Cromer. Specimen Irish Yews are planted at intervals of twenty feet, with climbing Roses between them, the latter being trained to Larch poles. The Roses are Carmine Rambler, Dorothy Perkins, Crimson Rambler, and Gardenia, the last a useful Rose for buttonholes. As to the herbaceous plants, I can only give you the names of a few of the more conspicuous. These borders are a great attraction during the summer and early autumn. The names are:—Delphiniums of sorts, Phlox of sorts, Inula glandulosa, Echinacea purpurea, Aquilegias of sorts, Chelone oblique and alba, Dielytra spectabilis, Romneya Coulteri, Heucheras Rosa Mundi and macrantha rosea, Scabiosa caucasica, Achillea The Pearl, Arnebia echioides, Monarda didyma, Dictamnus fraxinellus and alba, Coreopsis lanceolata, Helianthus maximus, Helenium pumilum, Gaillardias of sorts, Erigeron speciosum superbum, Galega officinalis alba, Iris of sorts, Pentstemon barbata, Gillemia trifoliata, Hyacinthus canadensis, Thalictrum adiantifolium, Montbretia George Davison, Michaelmas Daisies of sorts, Eucomus punctata, Incarvillea Delavayi, and Gypsopnila paniculata flore pleno."

Passing a Peach wall with several varieties, including Noblesse, Dymond, and Sea Eagle, we made our way to the Vinery.

"Here," I said, "you have a fine collection of Cactus Dahlias. What are the varieties?"

"They include H. J. Jones, Mabel Keith, Matchless, Fusilier, Emperor, Columbia, Earl of Pembroke, Primrose, Crayfish, The Pilot, Night, Lord Roberts, Country Girl, C. J. Stredwick, Uncle Tom, Cornucopia, Aunt Chloe, and Firebrand. The border at the bottom of the Vinery is, as you see, planted with Carnations, Mignonette, Asters, Zinnias, Pentstemons, and Xeranthemums. The Carnations include Raby Castle, Venus, Queen of Yellows, Coronation, Heckington, Cecilia, Alberta, The Dauphin, Reynolds Hole, and the Old Clove. For spring flowering we have Narcissus Madame de Graaf, Emperor, Empress, Mary Anderson, Major, and Sir Watkin."

"In the Vinery itself," continued Mr. Bradbrook, "are Black Hamburgh, Pearson's Queen, and Muscat of Alexandria. We have a fair crop, as a rule, but, as you know, plants and Vines do not do well together, and this being the only glass, except the pits, we are obliged to use the house for double purposes."

"You grow a great number of Zonal Pelargoniums here, for instance?"

"Between thirty and forty varieties. It takes sixty plants to fill a verandah in the courtyard by the hall. The singles are Ian Maclaren, John Milton, Mrs. Clifton, Andrew Laing, Rudyard Kipling (one of the best), Countess of Derby, Lord Rosebery, Southern, Evening Star, Lilie, and Achievement. The doubles include King of Denmark, E. V. Raspail, Raspail Improved, Picotee, Peach Blossom, Miss Floss, Azure, Lord Tennyson, and Grand Chan Faideherbe.

A Remarkable Plant.

"I notice you manage to grow a few Orchids."

"Yes, and we get some good blooms of Cœlogyne cristata, Dendrobiums nobile, and Cypripedium insignis. For the rest, the house contains a number of Solanums (well berried), Cyclamen, Asparagus Sprengeri, a few Palms, and Begonias Rex and Gloire de Lorraine."

"What is the name of that curious-looking plant at the end of the Vinery?"

"Phytolacca Decandra, or the Virginian Poke. It was introduced in 1640, and this specimen was planted, I should say, a quarter of a century ago. The birds carry the seeds, so that they spring up in all sorts of places. When once it is established, this plant is no further trouble."

THE LONG WALK, KETTERINGHAM HALL.

In the kitchen garden, which is very ornamental, as well as useful, Roses on poles are a feature. The varieties include Euphrosyne, Jersey Beauty, Field Marshal, and Lady Gay. A well in the centre has Roses planted round on wire trellis, and these, again, are surrounded by fine clumps of Arundo donax. Here, too, I observed a large number of autumn-flowering Chrysanthemums, while in the borders were a number of Violets. The varieties outside are Princess of Wales, Admiral Avellan, and Kaiser Wilhelm. In the four frames, Marie Louise, which is flowering splendidly, is the only variety grown. They have not been removed this year, but simply had the frames placed over them. Of course, fruit is a great feature in the kitchen garden, and first of all I asked the names of the Gooseberries on cordons.

Gooseberries and Currants.

"Lord Derby, Lady Leicester, Telegraph, Speedwell, Ringer, Phillip I., and Criterion. These are for dessert purposes, and can be more easily protected from the birds if grown as cordons. Other Gooseberries are Golden Drop, Regent, Champagne, Langley Beauty, Langley Green, Golden Lion, Keepsake and Warrington. Currants are trained as double cordons, and the varieties which do well are Fay's Prolific, Comet, Large Cherry, White Dutch, and Transparent White. The Black Currant mite has been a trouble to us; the only way to get rid of it, I think, is to dig the bushes and burn them. Picking the buds off is no use, but a good plan to prevent the disease from spreading is to put slaked lime round the bushes. We grow Lee's Prolific and Boskoop Giant, which is said to be mite-proof. There is only one variety of Raspberries in the fine breadth—Superlative, which is one of the best grown."

"How many varieties of Strawberries do you grow?"

"Royal Sovereign, Latest of All, Leader, Fillbasket, Givon's Late, Waterloo, and Laxton's Latest. Royal Sovereign is subject to mildew with us; Leader is a very heavy cropper; Waterloo is a good cropper, and holds out a good time; and Latest is a large, handsome fruit, bright scarlet in colour, with a good flavour. In order to grow Strawberries well, it is requisite to double-dig and use plenty of manure, not allowing the beds to remain for more than three years. We top-dress heavily with peat-moss litter from the stables."

"What about Apples?"

"We have two orchards containing Apples which have been planted about twenty years. There are two hundred and thirty trees, and fifty-three varieties. The soil is very stiff clay. When there is a crop, the colour is splendid, but, unfortunately, we had none this year. The trees suffered a great deal from late frosts, also from weevils and winter moth. The trees were completely riddled, as with shot. Our best kitchen varieties are Bramley's Seedling, Alfriston, Peasgood's Nonsuch, Lord Derby, Lord Suffield, Wellington, Saltmarsh's Queen, Queen Caroline, and Dr. Harvey, which is a great favourite in Norwich Market. The best dessert varieties are Lady Sudeley, Blenheim Orange, Cox's Orange Pippin, King of the Pippins, Worcester Pearmain, Allington Pippin, Gladstone or Jackson, and Ribston Pippin."

Pyramid Pears.

"Most of your Pears, I see, are grown on pyramids, with the leaders trained to iron arches, facing the Fig wall. Have you had a good crop?"

"Very; and we are still gathering some. Here are the names of the best varieties:—Beurré Clairgeau, Williams's Bon Chrétien, Catillac, Marguerite Marillat, Gansel's Bergamotte, Clapp's Favourite, Beurré de Capiaumont, Bergamotte Esperance, Shobden Court, Doyenné du Comice, Beurré Esperance, Prince of Wales, British Queen, Bergamotte March, and Zephiron Gregoire."

"Have you also had a good crop of Plums?"

"Equally good on the walls. The varieties include Angelina Burdett, Monarch, Rivers' Early Prolific, Greengage, Transparent Gage, Cox's Emperor, Prince of Wales, Orleans, and Coe's Golden Drop. The Cherries on the east wall are Bedford Prolific and Bigarreau, while on the north wall we grow Morella, The Noble, Black Heart and Florence, the last a very late variety. The south wall is planted with Apricots, Blenheim and Moor Park. We have to protect them in early spring, with small twigs of Yews."

"And as to vegetables?"

"For the first crop of Potatoes we use Duke of York, a very heavy cropper. The best late varieties are, I consider, Up-to-Date, Sutton's Reliance, and Factor, which last is a first-class Potato, resisting disease fairly well. Duchess of Norfolk has turned out well, and is a good cropper. Peas have done well with us this year; our earliest is Sutton's May Queen, and at the same time of sowing, which is, as a rule, in February, I also sow Sutton's Giant, which comes in only a few days later. I follow on with Gradus, Telephone, Duke of Albany, Alderman, Sharpe's Late Queen, and Gladstone. The last two sowings are of selected Ne Plus Ultra. The final sowing was on the 22nd of June, and we finished gathering on October 27th. The kitchen garden soil is mixed on gravel."

BRADBURN Margaret of 561 Garswood-road North Ashton near **Wigan** spinster died 24 February 1912 Probate **Liverpool** 21 March to Hannah Bradburn Adamson (wife of John Thomas Adamson) and Jacob Gorner restaurant proprietor. Effects £2194 10s.

BRADBURN Rose of 7 Stanley-street Hulme **Manchester** widow died 20 October 1912 Probate **London** 25 November to Edwin Bradburn warehouseman and Emily Bradburn spinster. Effects £220 5s.

BRADBURN Walter Stannard of 2 St. Georges-street Eccles **Lancashire** died 3 September 1912 at the Salford Royal Hospital Chapel-street Salford Administration **London** 21 September to Edward Victor Bradburn cloth merchant. Effects £376 1s. 11d.

BRADBURNE Mary Joanna of Swan Farm Norton Lanes near Cannock **Staffordshire** (wife of Arthur Bradburne) died 8 August 1912 Probate **London** 8 October to the said Arthur Bradburne farmer. Effects £2080 7s. 7d.

BRADBURY Abel of 4 Rock street Higher Broughton **Manchester** died 9 February 1912 Probate **London** 23 February to Harry Herbert Bradbury librarian and Arthur Vernon Roberts architect. Effects £232 1s. 1d.

BRADBURY Ann of 1 Warbrick-drive North Shore **Blackpool** (wife of Charles Bradbury) died 25 October 1911 Probate **London** 14 December to the said Charles Bradbury engineer. Effects £725 15s.

BRADBURY Anna Maria Doncaster of 1 Great George-street **Salford** spinster died 9 November 1911 Administration **Manchester** 16 January to Charles Henry Bradbury physician and surgeon. Effects £654 6s. 5d.

BRADBURY Anne of 31 William-street **Rochdale** widow died 19 November 1911 Probate **Manchester** 12 January to Harry Wycherley grocer. Effects £102 5s. 10d.

BRADBURY Annie of Kents Bank-road **Buxton** (wife of William Bradbury) died 8 April 1911 Probate **London** 28 May to the said William Bradbury cheese factor. Effects £917 1s. 1d. Resworn £967 1s. 1d.

BRADBURY Annie Minerva of Tamewater House Dobcross in Saddleworth **Yorkshire** spinster died 18 January 1912 Probate **London** 4 May to Edith Mary Bradbury spinster. Effects £756 11s. 8d.

BRADBURY Arthur George of The Bingham Public Library Cirencester **Gloucestershire** died 25 June 1909 Administration **London** 10 May to Mary Bradbury widow. Effects £257 10s.

BRADBURY Charles of 21 Lillah street **Salford** iron fitter died 15 October 1910 at Winwick Lancashire Administration **Manchester** 25 May to Thomas James Bradbury insurance agent. Effects £328 7s. 6d.

BRADBURY Elizabeth of High-street Tunstall **Staffordshire** widow died 17 May 1912 Probate **Lichfield** 19 July to James Bradbury and Albert Bradbury butchers. Effects £1190 15s. 10d.

BRADBURY Ellen of 68 Ripponden-road **Oldham** widow died 28 May 1912 Probate **Manchester** 20 July to Frank Bradbury cotton spinning master. Effects £1194 0s. 3d.

BRADBURY George of Tweedside Milton-road **Lowestoft** fish merchant died 11 January 1912 Probate **Ipswich** 29 July to Ann Elizabeth Bradbury widow George Hartley Bradbury fish merchant and Thomas Mason Allerton notary public. Effects £9007 13s. 3d.

BRADBURY John of 2 Winton-square Stoke-upon-Trent **Staffordshire** died 18 January 1912 Administration **London** 1 March to John Bradbury bank accountant. Effects £1974 16s. 9d.

BRADBURY John of 15 High-street Roughtown Mossley **Yorkshire** died 16 February 1912 Probate **London** 22 March to Mary Jane Wilde widow. Effects £77 7s. 1d.

BRADBURY John of Barrow-Sitch Heathylee **Staffordshire** died 20 May 1912 Probate **London** 19 July to Martha Bradbury widow. Effects £343 1s. 2d.

BRADBURY John of Red Lion Inn Stoke Old -road Hartshill **Staffordshire** died 11 September 1912 Administration **Lichfield** 9 October to Clara Bradbury widow. Effects £970 13s. 5d.

BRADBURY John Taylor of 10 Princes-avenue **Liverpool** gentleman died 25 February 1912 Probate **Liverpool** 19 April to Frederic Bernardo Bradbury and Henry Gordon Bradbury merchants. Effects £21348 2s. 10d.

BRADBURY Margaret of Mobberley-road Knutsford **Cheshire** spinster died 17 January 1910 Administration **Chester** 20 July to Lucy Bradbury spinster. Effects £198 12s. 5d.

to the roof there is perpetual motion, for the warm air, impinging on the cold glass, as well as the cold air entering by the laps, must cause ceaseless currents, which promote evaporation from the leaves, and so, as I suggest, cause short, woody growth. This conclusion is supported by facts. If a sheet of glass is placed over a box of seedlings, they soon become drawn, though they are quite close to it. If the glass is removed, or even only tilted, they begin to thicken. Apparently, then, it is merely a question of more or less air. This fact—if fact it be—may have some bearing on the evolution of climbing plants. For whether they originated in the fierce struggle for existence of crowds of seedlings, or in the depths of forests, as some suppose, one thing is certain—in neither situation would they have as much air as they would with more space for each and on open ground. Every traveller who has described a tropical forest has spoken of its "death-like stillness," and it is in the tropical forest that climbers are most abundant. On the other hand, it is on exposed hills and wind-swept commons that we usually find short, sturdy growth, as in the Heaths; for long, spindly growths we must go to the valleys.

March 27th.—The "Revue Horticole" advocates a method of preserving Apples and Pears which is new to me. It consists in dipping the fruit in a solution containing five hundred grammes of gum arabic to each litre of water. It is claimed that fruit treated in this way will keep sound and unshrivelled—in fact, perfectly fresh—for twelve months. When wanted for use, it has merely to be placed for a few hours in water in order to dissolve the gum, and then wiped and dried. This sounds simple, and, if really effectual, as I fancy it might be, it should prove valuable.

March 28th.—The sterilisation of the soil is much more largely practised in the United States than it is in this country. It is recommended as a preventive against the fungoid diseases which attack Carnations, Cucumbers, and various other plants, and also for the destruction of red-spider, aphis, and the seeds of weeds. Some American growers sterilise all the soil in their houses. The process is rather an expensive one, requiring special appliances. If, therefore, it is out of the reach of most amateurs, they would certainly find it beneficial to sterilise the soil in which they sow their more valuable flowers and Ferns. This can easily be managed by pouring boiling water into the pots of soil in which the seeds are to be sown, and continuing to do so until it runs out at the bottom almost as hot as it goes in. This will effectually kill all germs.

H. C. Davidson.

(To be continued.)

FAMOUS GARDENERS AT HOME.

No. 79.—Mr. R. BRADFORD, at HIGHWOOD GARDENS, ROEHAMPTON.

THE gardens at Highwood—Mr. E. H. Brown's charming house on the Roehampton side of Putney Heath—are not large, but they are kept in a manner which shows that the owner is fond of horticulture, and that the head gardener is a man who thoroughly understands his work. Mr. Bradford, who fills the latter position, is well-known as a successful exhibitor at the Wimbledon, Putney, and Kingston shows; and after I had spent a pleasant and profitable time in the inspection of the houses and beds outside, I asked him to preface the story of the gardens with a few details about his own experiences.

With characteristic modesty, Mr. Bradford rejoined that there was not much to tell, but he admitted that he had been showing for more than a quarter of a century, and had won a number of prizes.

"The prizes," he said, "include the cup for the Chrysanthemum group given by the Mayor at the Wandsworth and the tradesmen at the Wimbledon shows. I have also won five first prizes out of six for big miscellaneous groups, five firsts for Cyclamens, a first for six Gloxinias (given by Messrs. Sutton), and at the same show a first for six Gloxinias of distinct bloom."

"You do particularly well with Gloxinias and Cyclamens?"

"So far as showing either of them is concerned, I have not been beaten. Other first and second prizes—chiefly first—I have taken have been for Fuchsias, Japanese and Incurved Chrysanthemums, Primulas, table plants, Pears, Grapes, sprays, and a collection of vegetables several times. All these were awarded at Wimbledon, Wandsworth, or Kingston."

"Did you start your career as a gardener in Wimbledon?"

"No, my first experience was gained at Wentworth House, Mill Hill, Hendon, where I stayed for nine years. It was all-round experience, and I have found it very valuable. I came to Wimbledon as head gardener twenty-five years ago, and remained in that capacity at Dorrington House for five years. Then for twenty years I was in a similar position at Addington, Wimbledon Park, under three employers. Two years and a-half since I came to Highwood."

"Have you done any judging?"

"Only a little."

"The gardens at Highwood, I infer, are under ten acres?"

"They are about eight acres. The feature outside in the flower garden is undoubtedly the Roses."

"How many do you grow?"

"The number varies from eight to ten thousand, but they are always, in the summer, a splendid sight from the windows of the house."

"Which are the favourite varieties?"

"One bed, fifty to sixty feet long, ten inches wide, is devoted to Ulrich Brunner, which we tie down in order to arch. Another bed consists exclusively of Duke of Edinburgh. The long bed, which runs the full length of the house, is mixed. Highwood has always been noted for Roses, and we try to keep up and improve upon its reputation."

"Do you know how many kinds there are in the long bed?"

"Scarcely, but the principal are William Allen Richardson, Duke of Edinburgh, Paul Neron, Captain Christy, and Gloire de Dijon. We are always on the look-out for the new varieties. For instance, we planted Mr. and Mrs. Ben Cant last season. There are a dozen other beds, all mixed, and of different shapes. On the arch we grow Crimson Rambler, and we have most of the Tea Roses."

Mr. Bradford in Highwood Gardens, Roehampton.

"What is the nature of the soil?"

"We are right on a bed of gravel, so that we have to make the ground if we want to plant more Roses. I put a good deal of loam on the beds. One year they have loam, and another manure. This helps to make them more firm. Although we are exposed, being on the side of the Common, this is not a drawback."

"How about water?"

"There is no lack of water, because the supply is well maintained. The first summer I came here was dry, and £60 was spent in water on the gardens alone. We keep lawns as green in the middle of summer as in the early spring."

"Now, as to the bedding?"

"The terrace is carpet-bedding. Last year, being the Coronation year, we had the Crown and the letters E.R. in one bed. On another we had Queen Alexandra and the heart in the centre; on a third the Prince of Wales's feathers, and the letters G. and M. Sometimes I make the bedding in the shape of a butterfly, with body and wings."

"It is rather an elaborate business, then?"

"Somewhat, and, of course, it requires a good deal of time. Filling in the scrolls and corners entails a lot of work. But I am quite sure that unless carpet bedding is properly done, it is better to leave it alone."

"What are the flowers upon which you mainly depend?"

"There are thousands of Alternantheras of all sorts, particularly the dwarf-growing kinds. Sedums in many varieties are also used. Likewise Echeveria, Centaurea, Coleus, and Pyrethrum Golden Ball, which is new, and very pretty."

"As to the spring-bedding coming on," continued Mr. Bradford, "we fill in all the beds on the terrace with Hyacinths to colour. For very

dark blue we use King of the Hyacinths, and for white, Monarch. We carpet the terrace beds with Pansies also to colour, edging them with white and red Daisies. Nearly all the beds are filled with bulbs, and there is a groundwork of Forget-me-nots, or Pansies, or Daisies. For example, if we have a bed of scarlet Tulips, we use white Daisies for groundwork. At each end of the terrace is an Italian bed, which we fill with Wallflowers."

"Of different varieties?"

"Yes, the Tom Thumb (yellow), Belvoir Castle (deep orange), and Blood Red. Arabis albida is also used for groundwork. Another most admirable thing for this purpose is Alyssum saxatile compactum, whose masses of yellow flowers are as bright as Calceolarias. We have all the varieties of Polyanthus from Sutton's seeds, the blue and yellow Primroses, and we are edging some of the beds with Dactylis, a very pretty silvery Grass."

"Do you go in for late Tulips?"

"Extensively; and also the Spanish Iris. We have quite thirty varieties of Daffodils, and put out about a couple of thousand plants."

"You might tell me next about the summer bedding?"

"Cannas are largely used, and we cover the ground under them with Mesembryanthemum. There are about twelve varieties of Sweet Peas. Large beds are filled with Ivy-leaved Geraniums. We peg them down, and dot them with Nicotiana affinis. For the pink we use Madame Crousse, and for red Souvenir de Charles Turner and Marquis."

"What do you use for dotting the beds?"

"Plumbago for blue, and for varieties of foliage the silver and golden Abutilon. Among other things we use for summer bedding are Verbenas, Petunias, tuberous Begonias (of which we have a couple of large beds), ordinary Geraniums, including Henry Jacoby, Mrs. Parker, West Brighton Gem, Queen of the Whites, and John Hayes. Both the dwarf and intermediate varieties of Antirrhinum are grown, and, owing to the poorness and dryness of the soil, we find the dwarf kinds of Tom Thumb Nasturtium do remarkably well. We put out twelve varieties, embracing deep red, yellow, and all shades."

"There is no difficulty in cultivating them?"

"None at all. We sow them straight in the beds, and they can be transplanted easily, and do well. If the seed pods are kept pinched off, the plants remain in flower until the frost kills them."

"The annuals in the long border are, of course, grown for cutting?"

"Entirely, and no pains are spared to keep up the number. Among the many varieties are Sunflowers, Chrysanthemums (annuals), Stocks, Asters, Coreopsis grandiflora, Salpiglossis, and many others."

"You produce an excellent effect in the flower garden by an arrangement of Acer negundo variegata, and Prunus Pissardi, now in bloom?"

"Yes, and I wonder that Prunus Pissardi is not more grown in small gardens. The silver flower harmonises with the bronze foliage. We have a few nice specimens of Cedar deodara on the lawn."

"Now, I think, the kitchen garden claims attention?"

"It is an acre and a-half, and the herbaceous border at the top, facing the meadow and the tennis court, is from sixty to seventy feet long, and ten feet wide. The walks of the kitchen garden are edged with Mrs. Sinkins Pink, which, in flower, presents a very pretty appearance."

"You go in considerably for Peas?"

"There are sixteen long rows of Peas, and four large beds of Asparagus. We force both Asparagus and Rhubarb; also 1,500 crowns of Seakale. The only two varieties of Strawberries are Sovereign and La Sucrée; and of Raspberries we grow Superlative. There is nothing, in my opinion, to touch that variety. Onions we make a speciality. They are sown early in the year in pans under glass, and planted out in April."

"What varieties do you prefer?"

"Ailsa Craig, Ai, and Cranston's Excelsior. We grow Leeks, Lettuce, French Beans, Melons, Tomatoes, and Cucumbers under glass; also Strawberries in pots."

"And Peaches?"

"We grow Peaches outside on the wall facing south, the varieties being Early Rivers, Noblesse, Dr. Hogg, Waterloo, Early Louise, Royal George, Barrington, and Alexandra. The Nectarines on the walls are Elruge and Lord Napier; and on the back wall are Morello Cherries."

"You have some fine Palms in the largest house?"

"Several are twelve feet high. The principal kinds grown are Chamærops excelsa, Phœnix rupicola, Latania borbonica, and Kentia Belmoreana and Kentia Fosteriana. I may mention that we do particularly well with Dracæna Lindenii. This house also contains Ferns, Aspidistras, and all kinds of foliage plants suitable for the decoration of the dwelling-house, for which we have a large demand."

"You have one very old-fashioned plant in flower in the Palm house, which resembles a bunch of Grapes?"

A Beautiful Fern—Gymno gramma.

"The Medinilla magnifica. There is also a house devoted to Crotons; our collection consists of about fifty of the most useful varieties."

"What do you grow in the pits?"

"Melons, Cucumbers, early Tomatoes, three hundred Carnations (including several varieties of Malmaisons), Callas, Azaleas, Eucharis, and, amongst other things, two thousand Geraniums. I suppose that there are about six thousand plants for bedding. There is a pit full of tuberous Begonias. All the pits are heated. One is fifty feet long, like a house, and in this we grow Salvias, Bouvardias, Fuchsias, and Cyclamens. Another pit contains Gloxinias, and in yet another there are Begonias of the Gloire de Lorraine and Turnford Hall varieties."

"Your Azaleas look remarkably well?"

"They are now in the Tomato house. The principal varieties are Deutsche Perle and Roi d'Hollande. Of Liliums there are a hundred plants, chiefly Lancifolium, Longiflorum, and Melpomene. We force Tulips and Lilies of the Valley largely; also about a thousand Roman Hyacinths. In the vinery, Black Alicante, Black Hamburgh, and Buckland Sweetwater are the only Grapes grown."

"Have you paid special attention to any particular plants, Mr. Bradford?"

"I have read a paper before the Wimbledon Gardeners' Society on the cultivation of Begonia Gloire de Lorraine and its sports."

"What is your own method?"

"The plants which have been flowering through the winter I remove in the beginning of February to a house with a temperature of forty-five degrees. After they have rested about three weeks, I cut them back, leaving them in the same house for another three weeks. I then remove them to a temperature of sixty-five to seventy degrees. When the new growths are from two to three inches long, I have them taken off and inserted in small thumb pots, in light, sandy soil. They are kept close and moist until they are rooted, and afterwards they are placed on a shelf near the glass."

"When does the final shift take place?"

"Usually the first week in July, into 5-in. or 6-in. pots. They are then shaded and aired carefully, kept in a temperature of sixty-five to seventy degrees, and, when well-established, are fed with concentrated manure. I keep all flowers picked off until the end of September or the beginning of October, and then place the plants in a temperature of fifty to fifty-five degrees, and allow them to come into flower. Some specimens I exhibited were awarded a first-class cultural exhibit."

"Have you read papers on any other subjects?"

"On the culture of Cyclamens, herbaceous Calceolarias, and Primulas. I think that such papers are appreciated, and that if a man devotes special attention to any particular plants he may be able to give other people useful hints."

Alfred Wilcox.

LETTERS FROM A LADY GARDENER.

35.—HOT-WATER PIPES IN A GREENHOUSE.

Dear Kate,—So, after all, you have decided to have hot-water pipes in your new greenhouse, with one part of it shut off from the rest, with a glass partition and extra pipes, for a small hothouse. This will, of course, enable you to grow a great many more tender plants than those in the list I gave you last week, besides enabling you to force Lilies of the Valley, tropical seedlings (such as Cannas), and to grow many of the rarer Ferns, including several of the gold and silver varieties, such as Gymnogrammas, Nothoclænas, and other lovely Ferns. Nothoclæna chrysophylla flavens is the full title of the Golden Maidenhair, as it is sometimes called (although it is not an Adiantum at all), and very beautiful it is. Cheilanthes elegans (the Lace Fern) has the most exquisitely finely-cut fronds; Gymnogramma chrysophylla grandiceps is a lovely, crested gold Fern, covered with deep yellow dust; and G. schizophylla superba has lace-like, long fronds, powdered with silver, in the centre of the plant. Gold and silver Ferns, however, need special care, for they must neither be touched by anything, nor syringed, as the gold dust is easily washed or knocked off, and then the fronds die. They do best with us when placed on a board covered with fine ashes. Place on the stage, over the hot-water pipes, for they must have light and air, as well as a moist atmosphere. The watering of these little beauties should always be in careful hands, for they will not bear to be over-watered, and yet must not become too dry. But if you wish to have the most lovely of table decorations, you should grow Gold Ferns, ready to slip them into small bowls of silver or antique china on occasions. They stand the dry air of the house (without gas) very well for a few hours, but should be put back again before the morning, both to avoid risks of being

January 27th.—The growing tendency to devote a special part of the garden to Roses has a serious disadvantage. Like a whirlpool, it sucks all of them into its one comparatively small circle, and leaves none anywhere else. Personally, I like to see Roses all over the garden—in the borders, in the shrubberies, and especially on the lawn. Standards, I am told, have gone or are going out of fashion. That

Mr. Frederick Bright.

may be so; but what fashion, which I thought concerned itself with such matters as crinolines, has to do with gardening, I am at a loss to imagine. There cannot, in my opinion, be a more beautiful plant for the lawn than a good standard Rose, and in that position I shall always grow them. But Rose-beds on a lawn, charming as they are when properly treated, are often less satisfactory, the chief reason being that the soil beneath them is usually left bare. It ought to be carpeted with low-growing plants. Even such an experienced grower as Mr. F. Cant, who might be supposed to think only of the Roses, advocates this method; but the fact is that it does not hurt them in the least. On the contrary, by interposing a screen between the soil and the sunlight, it rather benefits them. Then, again, the want of something smaller than ordinary Roses is often noticeable at the outside of the bed. It is just possible that this want may be supplied by a new Rose, Madame Levavasseur by name, raised by Mr. Turner, and considered worthy of the Royal Horticultural Society's Award of Merit. It is described as "a dwarf and exceedingly floriferous form of the well-known Crimson Rambler, adapted for bedding or as edging for Rose-beds." It is in the latter capacity that it would be the more useful.

January 28th.—We are going, it is said, to have a law for the control or exclusion of undesirable immigrants. Well, I could put a Parliamentary Committee on to two or three which might be worth their attention. One of them goes by the name of Plusia Moneta. "A few years ago," says Mr. Holmes, "it first appeared in this country, feeding both on the Aconite and the Delphinium, when high prices (from five shillings upwards) were paid for British specimens. Now it is so common around London that I found nearly a dozen in the Chelsea Physic Garden"—which suggests that perhaps, after all, our climate may not agree with the creature—"and an acquaintance collected during a cycle ride in the neighbourhood of London last week as many as five hundred larvæ, so that it is spreading rapidly." He says also: "The grub appears about the middle of April, and its presence is recognised by the young leaves above the bud being fastened together, and later on by the black tips of the young leaves where they have been eaten." Now, I ask, isn't this a class of immigrant which ought to be kept out of the country? Is not it far more worthy the attention of Parliament than a dozen Polish Jews?

H. C. Davidson.

(To be continued.)

FAMOUS GARDENERS AT HOME.

No. 122.—Mr. Frederick Bright, at the Gardens, White Knights Park, Reading.

Although Mr. Bright warned me that, so far as appearances are concerned, the gardens at White Knights Park look their worst in January, I found on the occasion of my visit much to interest—more, in fact, than sufficient for the purpose. This, indeed, is generally the case, and I am glad that many gardeners, though not all, are good enough to realise that their courtesy in seeing me in winter is at least as much appreciated as it is in the season when there is a great show of flowers or fruit. The associations of White Knights Park are historical. Now the residence of Mr. Friedlander, it was seventy years ago one of the seats of the Duke of Marlborough. Since then the property has been cut up into seven estates, the mansion at White Knights Park being built on the site of the original house. The grand old trees, supposed to be the finest of any collection of the same size in the United Kingdom, are still a great feature of the place. But it was not the trees, nor any portion of the gardens, which first claimed my attention on my arrival at White Knights. Mr. Bright is, of course, a first-class, all-round gardener, and he also bears on his shoulders the weight of managing the farm. He has, however, a special reputation for successful cultivation of the Fuchsia. And, at the outset, after I had seen a number of the plants in their winter quarters, I asked him to tell me about his experiences and his methods of treatment.

"I have been growing Fuchsias for nearly twenty-one years," he said, "ever since I came to White Knights."

"Then this is the year you attain your majority?"

"Yes, in September. The reason I began was that Mr. Lees, of The Wilderness, my next-door neighbour, was growing them. I also commenced showing almost immediately at the Reading Show, and have shown ever since."

"In all classes?"

"I used to show in all classes, but when I had taken a number of prizes the committee barred me out of all but one class in the Fuchsia classes."

Fuchsia, Brilliant. (Photo taken in September, 1903.)

"Have you exhibited elsewhere than at Reading?"

"No, I have no time, and the expense is another objection."

"Do I understand that all through you have carried off the first prizes?"

"Practically. I have not been beaten. My exhibits have been collections of six and of four, and a specimen. For some time I showed a Fuchsia as a specimen against stove plants. On the last occasion, the Rose Show in the Jubilee year, 1897, I exhibited a specimen of Elegans against any plant in the show, and was awarded the first prize in the specimen class. Then the committee cut out the Fuchsia altogether, because they came to the conclusion that, as they said, 'Nothing could stand against those great monsters.'"

"How big was the last 'monster'?"

"It was ten feet high, and nearly five feet through. The pot in which it stood was eighteen inches across."

"I should like the names of the varieties which have achieved such a unique success."

"The dark colours are Charming, Elegans, Brilliant, Masterpiece, Clipper, and Wiltshire Giant; the light colours Western Beauty, Miss Balfour, White Queen, Jubilee Queen, Mrs. Bright, and Grand Duchess."

"Now, perhaps, you will tell me what you think proper as to your mode of culture."

"Of course, I start with a good cutting. February is the best month. After the cutting is properly rooted in an intermediate house, I transfer it to an ordinary greenhouse with plenty of light and air. Then I shift on according to growth and root action."

"What compost do you recommend?"

"I pot in two parts of good, turfy loam, one part of good leaf-mould, flaked but not rotten, one part of lime rubble, and one part of burnt wood ashes. Where the soil is heavy, I should recommend that sand should be included in the compost. It is unnecessary here because the soil is light. I go on shifting until the plants get to the specimen sizes wanted."

"Will you give me an illustration?"

"If my object were to grow a specimen plant ten feet high, I should put it in a 16-in. pot. Larger pots are only ugly and cumbersome, and, moreover, the plants do not thrive so well in them. The plants should be put out of doors the latter part of May, and kept there, in a sheltered position until they are thoroughly hardened off, when, providing they are properly staked and protected, they may be moved wherever there is light."

"How high should the stake be?"

"The last shift decides the length of the plant, and the stake should be just a little higher than the plant to allow for a hard line to steady in case of wind. In showing, the extra piece of stake, which is only for support, should be cut off."

"What about tying?"

"Great care should be taken to prevent a tie from being seen, and to avoid crippling the plant. All tying should be done six weeks before flowering, if possible, in order that the plant may have a natural appearance. The last stopping, or pinching, should also be done six weeks before flowering."

"At what stage of growth should the top-dressing be done?"

"As soon as the roots begin to appear on the top, some time after the final shift, they should have a top-dressing of a good mixture similar to, but rather richer than, the mixture used for potting. When the pots are full of roots, I give diluted farmyard manure water. But it must be used with discretion."

"As to flowering," continued Mr. Bright, "this can be regulated by the stopping. Fuchsias begin to flower six weeks after the last pinching. If they are wanted to flower during June, they should be stopped in April, and then they flower again in August. That is my principle, and I find it answers very satisfactorily. I have exhibited at two shows in the same season flowers of the same plant. My plants usually go on flowering until the end of October or the beginning of November."

"Is there any difficulty about wintering?"

"None whatever. Both before and during wintering they should be kept slightly on the dry side. When they are brought in, either in October or November, they should be pruned hard while they are in full growth. They will stand in any corner in a Vinery or other house, so long as they are out of the reach of frost. The pots can be put quite close together."

"As I saw them in your Vinery?"

"Yes. In fact, there is no place where large Fuchsias cannot be kept. We keep fifteen pots in our thirty-feet Vinery. There they rest until February, when we shake out all the soil, and put them back in as small a pot as possible."

"I gather that you are very careful about the foliage?"

"Unless the foliage of the plant is good, the flowers will not be good. If I find a plant with sickly foliage, it is very soon thrown away. There is no doubt that Fuchsias do need constant attention, even seven days in the week. They want water twice a day on Sundays, in hot weather just as much as other days. On the other hand, in wet, muggy weather no water at all may be required. The great point is to give water when the plants need it; to give it when they do not want it is like giving them poison."

Callistemon speciosus.

"What are their worst enemies?"

"Green-fly and caterpillar. I administer one good fumigation of XL. All just before moving the plants out of doors, and rarely have any trouble with green-fly. As to caterpillars, the only thing is to have them off the moment the leaves are pierced."

"Do you grow only the twelve varieties you named?"

"Only those and one other, Star of Wilts. There are probably a hundred, but we select simply those that will grow into fine specimens, give a wealth of colour, and make excellent plants. All the varieties we grow, which I think are the best obtainable, were raised by Mr. James Lye, my father-in-law, who at one time was the champion of Fuchsia-growers in England. He had ten special houses for them."

"I suppose that in the summer the plants are a feature in the garden?"

"They are dotted about, and look very gay. Last summer I had about thirty, some nine feet high, others more, and others again not so high. The flowers on the plants are too numerous to be counted."

"Now, I think, we might add some details about White Knights generally and yourself. Was this your first position as head gardener?"

"No, I was head gardener previously for five years at Clifton. I began gardening when I was thirteen at Bitten, Bristol, where Mr. Barnes was head gardener. Then I went for a time to Cyfartha Castle, and next to Westbury-on-Trym under Mr. Worthington, and lastly, before taking up the duties of head gardener at Clifton, to the gardens at Redland Court, Bristol."

"How large are the gardens here?"

"About five acres. There is a staff of six, and in Mr. Friedlander's absence I have charge of everything."

"What should you describe as the outside features?"

"There are the trees, including the splendid avenue of Elms as you approach the house. The Cedars are also very stately, and there is a fine specimen of an evergreen Oak which has to be cut back to make room for other trees. Hollies thrive here remarkably well, and the Rhododendrons, Azaleas, and Magnolias are very beautiful."

"Have you many named Rhododendrons?"

"About a hundred varieties. There is one very fine standard Rhododendron, The Queen. The others include the Pink Pearl, which I do not think can be equalled. Rhododendrons seem to flourish in the natural soil. We planted a quantity of ponticum by the lake, and they grew as well as in the gardens."

"How large is the lake?"

"It is about twelve acres in extent. The water in some places is fifteen feet deep, but the shallows are covered with the common white and the little yellow Lilies. Bamboos, Rosa rugosa, and several Hybrid Tea varieties of Roses grow on the banks of the lake."

"I see that the Hall is partly covered with Magnolias?"

"At present by Magnolias, Virginian Creepers, and Ivy. But we want to dispense with all except the Ivy, which not only makes the house look older, but covers it all the year. The conservatory, which is decorated in summer, is used as a Palm house in winter."

"What is your spring bedding in the right beds in front of the Hall?"

"Wallflowers—Sutton's Scarlet Beauty and Cloth of Gold—Polyanthus, Violas, Scillas, and Tulips, edged with Saxifraga."

"Then there are the Roses in the Italian Garden, with the old wall forming the boundary hidden by masses of Rhododendrons and Laurels."

"I suppose we have a couple of hundred of named varieties of Roses. There are ten beds mixed, but of one shade of colour, which we think more effective. Roses grow pretty well all the year round."

"When were the beds made?"

"Six years ago. I remodelled the garden after I came, and the Italian garden was improved under my care. It includes a herbaceous border about 140 yards long, and a large herbaceous bed. There are some fine specimens of Pampas Grass, and the Yew arbour, with a pump, dates 104 years back."

"You have fruit on the walls of the Italian garden?"

"Yes, Pears on cordon, Apricots, and Figs. Apricots do well with us, both the Moor Park and Grosse Peche. The Moor Park tree is twenty years old, and has borne good crops continuously ever since. They bear so well that I am always able to thin them out."

"What is the secret of your success with Apricots?"

"I can only attribute it to stopping and pinching the early growths. If the trees are permitted to make strong growth in one place, the

weaker branches give out, and canker appears. Also, I take care that the roots are on the surface so that they can be top-dressed and mulched in the summer."

"You grow all the leading varieties of Pears as cordons?"

"Most of them. The chief varieties of the trained trees are Louise Bonne of Jersey, Williams' Bon Chretien, and Royal Queen. In the kitchen garden we have the usual varieties of Apples, Pears, Plums, Gooseberries—which are also grown under wire netting with great success—and a fine Fig tree, Black Ischia, which is a splendid cropper."

"And vegetables?"

"All the ordinary kinds. In a separate piece of ground we go in considerably for Potatoes, including the Up-to-Date variety."

"Finally, there are the houses. I should be glad to have the names of the varieties in your new Peach house."

"There are sixteen trees in sixteen boxes, each of which is a different variety. We commenced the system about five years ago, and I find it very convenient. If a tree comes on too fast, it is shifted into a colder house; and if it is too thick, it can be thinned out and moved. They are all started in the house. The varieties are:—Peaches: Hale's Early, Alexander Early, Crimson Galande, Violette Hative, Dymond, Barrington, Bellegarde, Marquis of Downshire, Late Devonian, Stirling Castle. The Nectarines are Early Rivers, Cardinal, Spencer, Elruge, Victoria, and Pitmaston Orange."

"How many Vineries are there?"

"Three. The early house contains Black Hamburgh and Madresfield Court; the second Muscats, with a large Nectarine tree, Lord Napier, six years old; and the third Alicantes and Gros Colmar. I do not care for a number of varieties, and I think that it is one of the greatest mistakes a gardener can make to have many."

"You have shown fruit, I think?"

"A good deal in the past, and I still show a little. I have taken first for Grapes and other fruit. By the way, Melons are grown in the pits, and in a small forcing house twenty-four feet by twenty."

"What do you grow in the nice little Fernery?"

"Gloxinias, Begonias, Caladiums, and a few Orchids, including Cœlogynes and Calanthes. We also grow Lachenalia Nelsoni, a lovely yellow flower."

"How many?"

"From four to five hundred. They must not be forced much, or they will spoil. In "48's" we get about twenty-five spikes on one plant. Lachenalias are not grown half as much as they ought to be, perhaps because people do not know how to treat them. They should be potted up the first week in August, stood out of doors, sheltered from rain, brought in just before the frost comes on, and then kept in a cool greenhouse, fully exposed to light and air. Careful watering is also necessary."

"Are they expensive?"

"I have grown from one bulb, for which I paid a shilling, many thousands of flowers."

"Do you grow many Freesias?"

"Just about the same. We have only two varieties, major and refracta alba. Several varieties of Camellias, which are now in flower, are grown. I may add that we have always done wonderfully well with Maréchal Neil Roses. Last Easter I had more than a thousand flowers from the young plant, four years old, in the greenhouse. We had a tree which filled two houses. A visitor calculated that on it at one time there were 3,000 blooms."

ALFRED WILCOX.

WHEN planting Tomatoes, whether indoors or outside, be sure to make the soil as firm as possible. In a loose or over-rich soil the plants run too much to growth, and do not fruit freely, but if the bed or border is made almost as hard as the garden path the plants will fruit freely.

LETTERS FROM A LADY GARDENER.

No. 79.—FORCED STRAWBERRIES, SHRUBS, AND ONIONS.

DEAR KATE,—With February a great many gardening affairs begin, and we have a busy time of it. Strawberries, for instance, which we layered into thumb pots last June, and potted on into 5-in. pots at the end of July, have been standing outside until now (sheltered from frost, however), and now we take them in, for we like to have Strawberries for afternoon tea early in April, after which it is easy to keep up a succession until the outside crop is ripe. So we have each pot brushed or scrubbed outside, then we cut off with a pair of scissors all the dead or half-dead foliage, and top-dress the soil with a little cow-manure and soot, taking care to leave room for plenty of water, however. The pots are then ranged on a shelf, which is hung from the roof of the Vineries on iron hooks; this keeps them close under the glass, and the aspect is south, so they get plenty of sunshine. We give them plenty of water, but one has to hit the *juste milieu* in supplying them, for if they get too dry they will immediately have an attack of green-fly or red spider (or perhaps both), with direful consequences, and yet they must not be soaked when they are wet, until the flowers are set; after which they have warm water in the morning, and liquid manure in the afternoon, if the weather be dry and hot, with a daily syringing (with the Vines) at three o'clock, before the Vinery is shut up. But directly the fruit begins to look white, we stop syringing the Strawberries (because they are apt to mildew if they are shut up whilst wet), and leave a little air on at night. The flowers that open first are touched with a camel's-hair paintbrush, to distribute the pollen, but very soon this becomes unnecessary; and directly the first berry on each plant is set, we pinch off all the small side blossoms (reducing the berries to about six on each plant), and have some manure placed on the shelf on which they then stand. You can't give them too much nourishment at this time, but the soil in their pots must not be clogged, and thin soot-water, with an occasional change to Clay's fertiliser, suits them very well. We find Royal Sovereign bring much the best crop, both indoors and out; but the new Laxton Strawberry is said to be still better, and I hope to be able to tell you more about this later on, as we have a fine bed of this variety coming on. After fruiting, we put the Strawberries into the border, and they produce a second crop in the autumn, with a large crop the following year; it is a great pity to throw them away, as many gardeners do, for they then bear many more Strawberries than the runners which are put in at the same time.

I think everyone should grow Strawberries, for there is no fruit which more quickly loses its flavour, and those who cannot go out and pick their own Strawberries, warm with the sunshine, scarcely know how good they are. If I lived in a city, I should grow them in barrels, so as to have them safe from the cats; I believe one can buy revolving barrels, which can be turned round to the sun, so as to ripen the fruit evenly, and that directions for growing the plants are given in, but I have never tried them, because we have plenty of room.

In the conservatory it is spring, and oh, how delicious is the scent of the flowers! Lilacs are the sweetest of all, but the Philadelphus coronarius (commonly called Syringa, though that is the real name of the Lilac) is almost too richly scented for some people. But its lovely flowers, mock-orange, in purest white, are so useful at this time of year, and they look so well with the rich tints of the Japanese Azalea (mollis) that it is quite worth while to pot up a little bush of it in the autumn for early flowering. All it wants is moderate and gradual warmth, with an increasing supply of water as its foliage and buds appear. Never place a plant which is to be forced into strong heat at once, for this only weakens and puzzles the poor things. You see, we have to humbug them into thinking that winter is over, and spring has arrived; and we must keep this in mind, and not suddenly place them in summer warmth when they are not prepared for it. No, you must give a week or so to March, and then to April, before pretending that May, or even June, has arrived; and then the plants will develop gradually and rightly. Warm showers (from the syringe), a temperature of about fifty-five degrees to begin with, rising to sixty degrees after the first ten days, and then to seventy degrees (or more with sunshine) at the end of four or five weeks, will be quite rapid enough for most plants; but of course it is not easy to regulate the heat exactly unless one has two or three greenhouses with different temperatures. We have a warm Vinery inside the cooler one, so that it is easy to move the plants

PHILADELPHUS CORONARIUS—THE MOCK ORANGE.

bring all the great resources at their command to the imitation of Nature in her freest moods and her subtlest beauty, gardening will rank among the highest of the arts." If an explanation be wanted of "her freest moods," it will be found in another paragraph. "An isolated Furze bush, a single Buttercup, or a root of Poppies may be pretty enough in itself, but it is a whole common of Furze in full bloom that draws tears from the eyes of a Linnæus; billows of Buttercups, rolling over acres of greensward in the spring breeze; a whole copse carpeted with blue Hyacinths; a whole forest draped in the russet tints of autumn—these are the things that call forth the most rapturous delight in the lovers of Nature. But Nature never chops up her beds of Poppies into triangles and Maltese crosses, or intersects her valleys full of Bluebells with ribbons of red and yellow, pinked out as straight and stiff as line and rule can make them." He is inclined to think that carpet bedding is not without its value in teaching the effect of massing, and that may be true. The expression "mixed border" is often taken far too literally, the mixture being more conspicuous than the plants of which it is composed. The aim should be to obtain broad effects—not to sprinkle the plants about the border, but to mass them in large groups. That is Nature's method, and that is, and should be, the artist's method. It can be seen in any good picture, just as it can in any country walk.

MR. ERNEST BRISTOW.

Flower Borders.

May 31st.—I like to see the flower borders completely covered in summer, so that no earth is visible. Even in a small garden this requires a huge number of plants, but, if they are grown from seeds sown in a reserve bed, the cost is slight. Pansies make an excellent groundwork for Roses, and, though they cannot be considered permanent, they seed so profusely that there is no difficulty in keeping up a stock. Aubrietias and Saxifrages of various kinds are invaluable for covering the ground around taller plants, and Iceland Poppies are most useful for filling up gaps. Even when they are not in flower, the grey-green foliage is very beautiful. There are scores of other plants which may be used for the same purpose, annuals as well as perennials, and if it should appear later that they are too crowded, some can easily be removed. As a ground covering for hot, dry beds of sandy soil, the Portulacas are unrivalled.

June 1st.—Anyone with a warm greenhouse who wants handsome plants rather out of the common should try the Agapetes. They are evergreen shrubs requiring rather a high temperature, but otherwise not difficult to grow, the most suitable soil being largely composed of sandy peat and leaf-mould. One of the finest is A. macrantha. As the illustration shows, the beautifully-marked bell-shaped flowers hang down from the sprays in much the same way as they do in Solomon's Seal.

H. C. DAVIDSON.

ROMNEYA COULTERI, the great white Californian Poppy, is one of the most elegant of all herbaceous plants. It produces large, crinkled blossoms of the purest snow-white, and it enjoys a deep, loamy soil, and a warm and sunny position.

Famous Gardeners at Home.

No. 262.—MR. ERNEST BRISTOW, AT THE GARDENS, LEYSWOOD, GROOMBRIDGE.

FOR natural beauty it would be extremely difficult, even in the fair county of Kent, to surpass the gardens at Leyswood, Mrs. Temple's delightful residence, a short distance from Groombridge. The rocks, caves, and lovely slopes combine to heighten enormously the attractions of plants, shrubs, and Conifers, while the stately mansion itself, standing high above portions of the pleasure grounds, adds dignity to its charming surroundings. Visiting the gardens early in May, by the courtesy of the owner, I was fortunate in respect to weather; but at the end of a long afternoon I had to admit to Mr. Bristow, the head gardener, that the place required a full day in order to do it justice. Proceeding, however, to make the most of the time available, we started at the main entrance to the mansion, which bears the date 1869 on the wall, while on the house itself the creepers include Magnolia grandiflora and Exoniensis, Ampelopsis Veitchii, Clematis and Ivy.

The Fernery.

Connected with the morning-room in the mansion, some of whose foundations are natural rock, is a lofty and well-proportioned Fernery, with Ficus repens on the roof, Ferns planted in beds at the side, and a waterfall at the end. There is nothing artificial about the Fernery, and, lighted up at night, it must look very pretty.

"The Ferns," said Mr. Bristow, include Woodwardias, Nephrolepis, Phlebodiums, many of the Trees, such as Dicksonia, Cyatheas, and Cibotiums, numerous Pteris varieties and Aspleniums, with Todeas and other varieties on the rocks standing out of the water, while one of the finest of the many Palms is the Latania, quite at home on the top of the Fernery. By way of contrast, the Rex Begonias are a pleasing feature."

Specimens of Conifers.

"You have a nice combination for your spring bedding just outside?"

"On the south front. It consists of Wallflowers, Myosotis, and Tulips, the border being Tulips only, scarlet, pink, and white. Another round bed is composed almost entirely of dark Polyantha and Chrysolora Tulips; but there is very little bedding here—you will see more presently."

"I can see already that you have some specimens of Conifers?"

"Notably, Thujas (Lobbi), Araucarias, and Cedrus deodara. One of the finest Thujas is a Sieboldii, very rare here, and difficult to cultivate. On the Pinetum, which we are now approaching, is a fine specimen of Larix Griffithii, and some good examples of Abies Albertiana and canadensis, Retinospora plumosa, and Picea glauca."

A Collection of Chamærops.

"Your Bamboos do well in the dell below."

"It is just the spot for them, and here also you will notice that we have a collection of Chamærops Fortunei."

"With at least one magnificent specimen."

"That is the original one which, as a dormant crown, was imported by the late Mr. Temple from the Continent about sixteen years ago. We have now two dozen, and when they get too thick in the beds, we plant them in the turf. Chamærops require to be in a dell where the wind and sun are not likely to injure them. They only flower occasionally, but the blooms last for three or four weeks, and the great yellow trusses show up at a distance."

Rhododendrons Without Peat.

"The grounds must be very extensive," I said, as we made our way to the long walk, with Rhododendrons and Azaleas at the end.

"The woodland walks and pleasure grounds cover thirty-five acres, and include an avenue of Cupressus Lawsoniana. Rhododendrons are quite a feature, and there is no peat in the soil. In fact, I prefer to plant them in loam. I suppose that on the rocks there are thousands of seedlings. In some places they grow so rampantly that we have to make a clean sweep of them. There are several named varieties planted in beds, such as The Queen, Madame Wegner, Princess Mary of Cambridge, Antony Waterer, and John Waterer."

"The branches of those on the rocks by the

LEYSWOOD, GROOMBRIDGE, FROM THE PARK.

terrace near the large stone, resting on three others, and looking as if it could fall, must hang down many feet?"

"Quite fifteen. We allow things to grow naturally on the rocks. Ampelopsis and Lonicera are among the creepers, and on the banks are several specimens of the variegated Acers, Liquidambars, Cratægus, Pyrus, Prunus, etc."

The Flower Garden.

Then, after a glance along the main drive, where Laburnums, Thorns, flowering Crabs, and Spiræa flourish, and a peep at the delightful tea gardens close to one of the rock gullies, we hastened to the flower garden, which was literally cut out of the wood, and is still backed by it. But, in the approaches, and round the borders which extend two hundred yards, are many choice flowering shrubs.

"The collection," said Mr. Bristow, "embraces Cryptomeria elegans, Retinospora plumosa aurea, Taxus boccata aurea, Cupressus erecta variegata, Thujopsis dolabrata, Acers, Althæas, Azara microphylla, Choisya ternata, Olearia Haastii, Skimmia fragrans, Berberis, Cotoneasters, Syringas, and Veronicas in variety. They are edged all round with Dactylis elegantissima."

"And the beds?"

"The centre bed is planted with Cannas. Most of the others contain Pelargoniums in varieties, Verbenas, Ageratum, Lantanas, Begonias, Coleus, and variegated Maize, with Grevilleas, Acacias, and Heliotropes as dot plants; there are two with Pentstemons, Godetias, Antirrhinums, and Verbenas; and four corner beds are filled with Gladioli. There are forty beds altogether, and I may say that, for bedding purposes, we grow quite twelve thousand plants."

Roses Pegged Down.

"How many beds are there in the Rose garden, with a collection of Rhododendrons at the back?"

"Two long beds a hundred and forty feet long, and two round beds. The number of plants is about seven hundred, and there are two hundred and fifty of the best varieties. I get a few new ones each year. The beds are mixed. I think the effect lasts longer than with clumps of single varieties. All the Roses are pegged down, and we get ten to twelve inches of stem, which is so useful for cutting. At the back is a nice specimen of the Umbrella Pine, Sciadopitys verticillata."

"Are the Roses chiefly Hybrid Teas and Hybrid Perpetuals?"

"Yes, and those that do best are Frau Karl Druschki, Mrs. John Laing, Marquise Litta, Caroline Testout, Jeannie Dickson, Margaret Dickson, Ben Cant, Bessie Brown, Corallina, Mrs. Sharman Crawford, Mrs. W. J. Grant, La France, Tom Wood, and Mater."

A Splendid Collection of Camellias.

Having now completed, as far as possible, the tour of the pleasure grounds, we turned our attention to the houses, appropriately beginning with the Camellia house, which is one of the finest in the country. As I expressed my admiration of the house and its contents, Mr. Bristow replied:

"You would have seen it at its best in March and April, but the collection is, I believe, remarkably good. There are about sixty varieties, and many of them were imported from the Continent."

"Do you use much heat?"

"Merely enough to keep the frost out. I prune them back annually, but they do not require much attention, although they have to be kept in bounds. Several of the flowers are as finely marked as Picotees. I am not surprised that Camellias are coming into fashion again, because of the wealth of bloom they yield at a time when it is wanted."

"I should like the names of a few of the varieties you think the best."

"Franzina is a very fine crimson; Incarnata, a very soft pink; Madame de Strekaloff, a distinct pink and cream; and Albina Bottii is the best pink. Other very good varieties are suberba, Donkelaarii alba plena, fimbriata, Discus italiana, centifolia carnea, Solfatara, Angela Cocchii, Etrusca, Maria Levesa, Isabella, Regina Margherita, imbricata tricolor, Caterina Loing, Bonomiana, and Bertha Ravene. On the roof of the house are Roses, Clematis, Lapageria, and Plumbago capensis."

"Including this, how many houses are there in the gardens?"

"Twenty-eight, many of them large; the inside staff is seven. In the house we are just entering are some Anthuriums, Caladiums, and a few stove plants; and here we grow early Melons, Sutton's Scarlet, Superlative (which is the very best, taken from all points of view), and Ringleader. The Cucumber is Veitch's Unique. We do not grow a great number of varieties, but, when we get a thing that suits us, we stick to it."

THE MAIN ENTRANCE TO LEYSWOOD.

"You go in largely for Orchids?"

"That is certainly one of our features inside. This is the Odontoglossum house. Nothing is easier in Orchids to grow than Odontoglossums if you can start them well. It is a great mistake to have slate beds; an open woodwork stage is an absolute necessity. Another necessity is plenty of fresh air through the house, although it is important to avoid draughts and air from the top. The varieties now in flower include some nice specimens of O. Crispum and O. Andersonianum, O. triumphans, O. Edouardi, O. Ruckerianum, O. Halli leucoglosus, O. luteo-purpureum, and O. Coradenei. At the end of this house are some very fine specimens of Masdevallias, including Harryana, Veitchiana grandiflora, Pourpaxii, trochilus, and Shuttleworthii. There are quite five hundred spikes in this house, and one thousand five hundred plants."

CHAMÆROPS FORTUNEI IN FLOWER, AT LEYSWOOD.

"You have more Odontoglossums in a second house?"

"Yes, but these are newly imported, and also include many varieties similar to those in the other house. Here are some Cyclamen, which are always welcome at the dull time of the year, and we grow Ferns under the stages; the latter both adorn the house and are useful for cutting."

Dendrobiums in Flower.

"How many varieties are there in your Carnation house?"

"About two dozen, all Malmaisons, and the best of the varieties are Calypso, Prime Minister, Pink Malmaison, Churchwarden, and Iolanthe. Now we come to two more Orchid houses, principally Cypripediums, but there are also Dendrobiums, and Calanthes. There are also a few Nepenthes, the varieties being Hookerii intermedia and Mastersiana."

"You might tell me the names of the Dendrobiums in flower."

"Chiefly, Hildebrandtii, Dalhouseianum, cretaceum, crystallinum, albo-sanguineum, thyrsiflorum, agregatum majus, also Phalænopsis Rimestadium. The Cypripediums in flower are chiefly Elliottianum, Chamberlainianum, Haynaldianum, Mastersianum, Zeus, and Euryandrum. A plant of C. selligerum majus has seventeen flowers."

"And the next house?"

"It is devoted to Palms, with Ferns

all along the stage. The Palms are chiefly Cycas revoluta, and Kentias Fosteriana and Belmoreana. Then, there is a remarkable plant called Ravenola madagascariana. It has been here eighteen years, and is much the same now as it was when I came. Its height is quite fourteen feet, and the leaves are very handsome, like large shields. On a back stage are Bananas, which do very well; we have hands with one hundred and fifty fingers on; there are eight trees, three or four of which fruit each year. The Monstera deliciosa, with leaves like a skeleton, bears acid fruit, and you might add that there is a fine specimen of Pandanus utilus."

Temple's Variety of Cattleya Skinneri.

"You have yet another fine Orchid house?" I said, as we entered quite a large building with a number of magnificent flowers.

"This is the Cattleya house, and it is seventy feet long by twenty-two feet. It contains quite sixteen thousand plants, and the blooms, which as you say dominate the house, are Temple's variety of C. Skinneri. Mr. Temple originated it here, and it has been certificated. The colour is superb, a rich magenta with cream throat. One spike has nine flowers on it. Other Cattleyas in flower are Skinneri alba, Mossiæ, Lælia, Latonia, Mendelli superbissima, and a plant of C. Mossiæ which has been here twenty-four years, and has flowered annually. There are six spikes of bloom on it now. The collection here includes a number of Lælia-Cattleya and Brasso-Cattleya hybrids."

The Flowering House.

"Then," continued Mr. Bristow, "there is the intermediate Orchid house, which contains Cymbidiums, Lycastes, and Oncidiums. One of the varieties of the latter is O. Marshallianum, and there is a curious specimen of Lycastes gigantea, the brown portion of which is like a horse's head. All the Lycastes do well, also Angulosas and allied genera."

"What are the present features of your range of flowering houses?"

"Cinerarias stellata, Azaleas, Zonal Pelargoniums, Ivy-leaved Geraniums, Stephanotis, Streptosolen Jamesonii, and Rhodochyton voluble on the roof. In the next range, President Carnot Begonias are planted out, and become very fine later in the summer. We also, of course, grow Begonias Gloire de Sceaux, Gloire de Lorraine, and Perle de Lorraine. Roses are grown in pots in another house, and Franciscea calycina major, which flowers in the spring, is a useful stove plant, requiring only ordinary treatment."

"I see you go in for Schizanthus?"

"Yes, we find it very useful; it is generally known as the 'Poor Man's Orchid.' The plants close by are Dasylirion longifolium, which is also very useful. Of the Tree Carnations, we grow Madame Franco, Sir Hector Macdonald, Enchantress, and America; and of Chrysanthemums about five hundred of the leading varieties."

Grapes and Peaches.

"What about Violets?"

"We grow four varieties, Marie Louise, Mrs. Astor, Princess of Wales, and Kaiser Wilhelm. Now we had better take the fruit houses, beginning with the Vineries. In the earliest house we have Black Hamburgh and Buckland's Sweetwater; in the medium house, Black Alicante, Gros Maroc, Lady Hutt (a very useful white), and Alnwick Castle. In another house is Muscat of Alexandria and Mrs. Pearson. Here we have Figs plunged in pots, principally Brown Turkey. The advantage of growing Figs in pots is that they can be shifted when and where you like. In the late Vinery, Lady Downe's Seedling and Black Alicante are grown. The only Strawberry forced is Royal Sovereign, of which a large number are grown on the shelves in the various houses."

"What are your earliest varieties of Peaches?"

"One of the best in the Peach house is Dymond, which, if not so good in colour, is a very fine flavour. The Nectarines here are Rivers' Early and Lord Napier."

"But you grow a great many of your Peaches and Nectarines in the great case where you seem to have a fine crop of fruit."

"Yes, the case contains an almost complete collection. It is one hundred and fifty feet long, and has the advantage of facing south-west. The Peaches are Bellegarde, Dr. Hogg, Alexandra, Noblesse, Grosse Mignonne, Barrington, Sea Eagle, Walburton Admirable, Waterloo, Stirling Castle, etc.; the Nectarines, Cardinal, Dryden, Precoce de Croncels, etc. Lettuces are put in boxes, and planted out in this case. The variety is Sutton's Forcing. Finishing with indoor fruit, you might mention that the Tomatoes we grow are Sutton's Satisfaction, Winter Beauty, Holmes' Supreme, and Ham Green Favourite."

"I much admire the border in front of your own house, and extending considerably beyond."

"It is two hundred and ten feet long, and consists of Wallflowers at the back, with Tulips intermixed, and Polyanthus in front. There has been a great quantity of flower, but, naturally, it is now beginning to flag."

The Best Apples.

"What are the features of your extensive kitchen gardens?"

"In the lower garden there is a fine collection of Apples, espalier and pyramid. Among others doing well are the Queen, Allington Pippin, Cox's Orange Pippin, and Bismarck. We grow about fifty varieties, including the standards, and in addition to those named, I think, for crop and quality, the most reliable are Worcester Pearmain, Tower of Glamis, Borovitsky, Newton Wonder, Duke of Devonshire, King of Pippins, Brabant Bellefleur, Court of Wick, Lord Derby, and Gascoyne's Scarlet. The borders in front of the espaliers are used for beds of Auriculas, Carnations, Anemones, English and Spanish Iris, Sweet Williams, and other flowers for cutting. The north side, as you know, contains the range of fruit houses, and the south side a broad walk with herbaceous borders, embracing a representative collection. Of Plums, the best we grow are Victoria, Coe's Golden Drop, and The Czar."

Specially-trained Pears.

"Pears appear to be the feature of your top kitchen garden."

"They were planted thirty years ago, and trained, as you observe, horizontally first, and then vertically; they furnish the wall more completely and more rapidly than when they are merely trained horizontally. Although they do so well on walls, Pears will not thrive well here in the open, either as pyramids or espaliers, the subsoil being very wet and heavy. Among the best varieties are Louise Bonne of Jersey, Beurré Diel, Doyenné du Comice, Doyenné d'Hiver, Doyenné d'Alencon, Duchesse d'Angouleme, Glou Morceau, Bergamotte Crassane, Bergamotte d'Esperen, Josephine de Malines, and Emile d'Heyst. Many of the Currants are grown on walls instead of on bushes, and most of the bush fruit is netted."

"What about vegetables?"

"I prefer to grow two or three varieties of each kind known to do well in this soil, rather than a large number of varieties. We have all the usual kinds, but there are no special features in vegetable cultivation."

"How long have you been at Leyswood, Mr. Bristow?"

"I came here as Orchid-grower in 1889, and in 1901 I was entrusted with the entire charge of the gardens. The first eight years of my gardening life were spent at Zeals House, Wiltshire; I was next for some time foreman at Langford Park, Essex, and subsequently, prior to my appointment at Leyswood, I was Orchid foreman at Downside, Leatherhead. Mrs. Temple takes a keen interest in her gardens and their welfare, which is always encouraging to the staff."

ALFRED WILCOX.

THE GARDENER'S COTTAGE AT LEYSWOOD.

STRAWBERRIES weighing no less than two ounces each—eight to the pound!—were shown recently at the Royal Horticultural Hall. The variety was Royal Sovereign.

AMONGST the awards of merit granted at the Temple Show was one for Saxifraga aizoon rosea, shown amongst the excellent display of Alpines made by the Craven Nursery Co., Clapham, Lancaster. This is one of the excellent varieties in the firm's unique collection of Saxifrages, and its attractive features were much admired by the visitors.

form of liquid manure, which they can readily assimilate. The crowns contain a large number of dormant buds. When the stems are cut down early enough in summer, some of these buds are forced to grow, but there are always enough left for growth in the following year.

H. C. DAVIDSON.

THE CORREAS.

The Correas are hard-wooded evergreen greenhouse plants, and although they were introduced from Australia into this country over a century ago, they have not met with the popularity they deserve. Many gardening books omit to mention them, while those which give reference to the genus are content with quite a small paragraph. Amateurs who are looking for a really useful flowering shrub for pot culture in the greenhouse might with advantage give these a trial. They will thrive in the unheated greenhouse, provided the temperature can be kept a few degrees above freezing point in the winter.

The best time to pot the plants is in July, and they should be put in a compost of two-thirds peat and one-third of good fibrous loam, with a fair sprinkling of sand. The potting should be firm. The various kinds flower in spring and early summer, and when the flowers are over the plants should be cut back and kept in healthy growth by syringing during the evenings when hot weather prevails.

Cuttings may be taken in the spring, and these should be provided with a "heel" of the ripe wood, and inserted firmly round the edge of a pot in a mixture of peat and sand. The cuttings must be kept moist and close. The plants are not particularly subject to insect pests, but scale will sometimes affect them, and this is usually combated by the use of Gishurst Compound.

The flowers are tube-shaped, and their partial resemblance to Fuchsias has earned for them their popular name of Australian Fuchsias, although they are not related in any way to Fuchsias. C. cardinalis is a handsome March-flowering species with bright scarlet flowers; and C. Brilliant is a very free-flowering hybrid, with flowers of a similar shade. C. alba and C. speciosa produce respectively white and scarlet flowers in June. The plants vary in height from three to five feet.

H. GREAVES.

Specimen copies of GARDEN LIFE will gladly be sent to any reader who will be kind enough to distribute them.

Famous British Gardens.

GOODWOOD PARK CHICHESTER.

Interview with Mr. F. Brock.

GOODWOOD this week receives a large share of public notice, for the race meeting taking place there is regarded as one of the most important of the year, while to the fashionable world it marks the close of the London season. The racecourse is on top of the Downs, amidst surroundings so beautiful that it has come to be known as "Glorious Goodwood." And glorious it truly is, with charms peculiar to the South Downs. Here are breezy uplands and magnificent woodlands; delightful valleys clothed with springy turf; wonderful views across the country, with a glimpse of the blue Channel to the south; and an air at once soft and bracing, a tonic for jaded nerves, and a healer for ill-health.

The park is sixteen hundred acres in extent, and is open to the public at all times, with the exception of one day in the year. Nor are there any restrictions; one can wander at will through any part, and the house itself, with its priceless art treasures, is open to inspection two or three times a week. The owner, the Duke of Richmond and Gordon, takes pleasure in visitors enjoying the beauties of the park, and facilities for pic-nic parties are afforded.

It wanted a fortnight to "race week" when I paid my visit to the gardens, and was conducted round by Mr. F. Brock, who has been in charge for the past sixteen years. They are surrounded by a belt of high trees, which effectually screens them from the main road running through the park. But the house and its surroundings first claimed attention, and the chief objects of interest were pointed out by Mr. Brock.

"The Cork Oak, Quercus Suber, is a feature here," he said, as we entered the railed-off grounds near the house; "and these three are considered remarkably fine specimens. They are more than the average height, and the cork is many inches thick. We have others in different parts of the park, and have raised a number from acorns."

Three tall hedges of the evergreen Oak, Quercus Ilex, act as windbreaks, and also serve to divide up the lawns. The small lawn here, on what is called the Library front, contains the only piece of "bedding out" to be found, the fourteen beds being filled with Geranium Paul Crampel.

The space in front of the mansion is kept clear, the park coming up to the main doors. From here splendid vistas are obtained in various directions, the trees in the distance having been planted with a masterly eye for effect. Everything is in keeping with the style of the house, and the simple grandeur of its surroundings, and is necessarily on a large scale. On the walls, which are of Sussex flints, Ampelopsis Veitchii was already colouring nicely—"It is always early with us," said Mr. Brock—and Magnolia grandiflora was in full bloom.

"How long have these been planted?" I asked.

"In 1906," was the reply. "You can see the situation suits them, as they are already from twenty-five to thirty feet high. But Goodwood was one of the first houses to have the Magnolia in England, as it was planted here in 1734, soon after it was introduced."

BROAD MASSES OF COLOUR.

Broad patches of colour are seen as we pass the lawn facing the ballroom, and covering the site formerly occupied by the conservatory. The centre bed is of considerable size, with pink, blue, and yellow predominating. Pale blue is supplied by Erigeron speciosum superbum; and a deeper tone is struck by Salvia virgata nemorosa. This is a deep blue, and as the clump is fully ten feet across, the effect of the mass can be easily pictured. Anthemis tinctoria gives a rich yellow, which is toned down by the delicate pink of Antirrhinums. The level is broken by tall pillars of Wichuraiana Roses, Minnehaha, White Dorothy, and Sweetheart being conspicuous. For the outside beds Antirrhinums such as Fire King and Orange King again figure largely, relieved by herbaceous plants. Here, again, Anthemis tinctoria is most successful, and another tone of yellow is imparted by Helenium pumilum grandicephalum. These are only a few of the perennials employed.

THE ROCK GARDEN AT GOODWOOD.

Walking round to the north-east, where Lonicera fragrantissima, the winter-flowering Jasmine, clothes the wall, we reach the "old wing"—as its name implies, the oldest part of Goodwood House. Here are the apartments which the late King Edward occupied, and which His Majesty King George likewise uses. Fronting this is a lawn of several acres, which at one time was a paddock. Now it is one of the most attractive parts of the pleasure grounds, and is known as the "New Garden." It is bounded by a stone wall, and behind that the Evergreen Oaks (Quercus Ilex) tower to a height of a hundred feet or so. Clumps of Bamboos, of which Phyllostachys fastuosa is especially noticeable, and many fine trees, are hereabouts.

A SPLENDID SALVIA.

Through the trees one catches a glimpse of a huge bed of Erigeron glabellus, a mass of pale mauve; and higher up we come to an even finer one of Salvia virgata nemerosa, which I have already mentioned as being so effective on the "ballroom" front. This bed is circular in shape, and measures thirty-five feet across. In response to my question, Mr. Brock said:

THE TAPESTRY LAWN, LOOKING FROM THE "TAPESTRY ROOM" AT GOODWOOD.

"The plants were put in in 1910, and beyond an annual thinning-out, and a mulching in early spring, nothing is done to them. It is one of the finest plants I know where a strong blue is required, and when the petals fall the purple calyxes are equally beautiful. It is a plant, too, that seems especially attractive to bees, and you can see how they hover around it. But to be effective it must be massed—one or two plants would be comparatively insignificant."

"Then you have a very striking bed of Marguerites."

"That bed is thirty yards long, and the pillar Roses which are dotted in it are Hiawatha."

"Do you protect the Pentstemons in this bed in winter?" I asked, as we moved onwards.

"No; it was planted ten years ago, and has received no harm. It is the fairly hardy variety, Newbery Gem; but in the bed higher up we have one of the florist's type, Lady Yester, a pretty shade of pale pink, which has stood unharmed for three years."

A FINE PERGOLA.

Running the full length of this lawn—which, I was told, had had to go for five years, and was only got in order this spring—is a wooden pergola, eight hundred feet long, covered with Roses, Clematis, and other suitable subjects. It was built, and the new garden laid out, especially for King Edward, and its construction involved many alterations. The evergreen Oaks which bound the garden, and which were planted one hundred and thirty years ago, overhung the path to the extent of thirty feet or more. They were cut back to allow of the erection of the wall, and a ha-ha, or sunken fence, was done away with.

In a position so favourable, with the tall trees behind to check the winds from the north and east, and in a naturally light soil, plants flourish on the wall which elsewhere are grown only in the greenhouse. Thus, as we passed along, stopping now and again to examine a plant, Mr. Brock explained:

GREENHOUSE SHRUBS OUTDOORS.

"Here is Calceolaria integrifolia, a beautiful shrub, which was planted out in 1910. The Glory Pea of New Zealand, Clianthus puniceus, is well established. It has been planted out for six years, and not only flowers, but ripens its seed. The Passion-flower, both blue and white, flowers and fruits here; and the greenhouse Genista, or Cytisus racemosus, has also stood for ten years. Here is the Bottle-brush, Callistemon speciosus, another greenhouse shrub, flowering freely every year; and Acacia dealbata, which was planted out eight years ago, has grown above the wall, and is covering the top of the pergola. A somewhat rare greenhouse shrub that does well on this wall is Crinodendron—or, to be correct, Tricuspidaria—dependens. It is a new introduction, and so is not much known. Senecios Heritieri and Grayi are valuable for their foliage and flowers, and have come through the winters unharmed. Another Senecio which makes a handsome wall shrub is S. rotundifolius. Leptospermum scoparium Nichollii, with ornamental leaves of purple colour, has not been introduced more than a dozen years, and is classed as a greenhouse plant, but, as you see, it does well out of doors down here."

Many other interesting shrubs were pointed out on this wall, such as the Soap Plant, Quillaja Saponaria, the bark of which is used in Chile as a substitute for soap; and so we came to the end of the pergola, and turned along to the left, by a path of Roses made at the time of the Crimean war. Across the lawn could be seen a tree of Pittospermum undulatum, which ripens its seed—in fact, many plants have been raised from it, as I saw later in the kitchen garden. Of interest, too, is a Lilac, which was a pot plant in 1815, when the Duke's father was born, and still bears flowers.

Against the wall on this side, facing full south, are many other plants which are only hardy where the conditions are particularly favourable. Abutilon megapotamicum, better known as A. vexillarium, has been here ten years, and was a mass of bloom, its yellow and scarlet flowers being very effective. One of the large-flowered hybrid Abutilons, a rich crimson, was likewise in bloom, and had stood out for a similar period. Romneya Coulteri is frequently met with, but R. trichocalyx, which also flourishes, is less common, being of fairly recent introduction. The Loquat, too, not only survives, but flowers freely; and Sphæralcea munroana, being hardier, finds no difficulty in making itself at home, as does Abutilon vitifolium. Two large trees of the Wintersweet, Chimonanthus fragrans, give no trouble; and honey-scented, white-flowered Rhyncospermum jasminoides was delightful, both to see and to smell. Teucrium fruticans, Azara microphylla, Cæsalpina japonica, and more Passion-flowers, are in this section of the wall, with many other interesting shrubs. But enough has been said to prove how well even tender subjects thrive in this favoured spot, thanks not only to the mild climate, but to the belt of evergreen Oaks which rise to a height of a hundred feet.

THE TAPESTRY LAWN.

Arrived at the end of the walled garden, we glanced to right and left, the eye following the paths through the trees, magnificent Beeches Limes, Oaks, and Chestnuts. Our way now lay, however, to the left, where an avenue of grand old Chestnuts brought us again to the State or Tapesty Rooms, which give the name to the lawn in front. This is a splendid piece of turf, with woods on each side, and is several acres in extent. Rugged old Cedars and other trees assist to form a framework, while through an opening can be seen in the distance the white building known as The Kennels. Close to where we stand is a Lime, fully one hundred feet high, with Mistletoe growing almost to the top; and further round Mr. Brock pointed out a Service Tree, which he says is one of the oldest in the country:

"It is the true Service Tree, and seed was brought from the South of France in 1759 by the second Duke. Loudon could not find it when he visited Goodwood in 1837; but I think it had probably been cut down then, and has since come up again from the base. As you see, it has now four thick branches arising from close to the ground."

We now started to walk across the park, on our way to the gardens, looking back now and again to admire the beautiful outlines of the Cedars growing near the house, their tops breaking the sky line. To right and left, also, the trees are magnificent, varying in outline and colour of foliage; and I remarked that the planner had fine imagination and a seeing eye.

THE FINEST CEDAR IN ENGLAND.

"The park was planted between 1760 and 1770 by Collinson, under the supervision of the second Duke, who was himself a great planter," said Mr. Brock. "Here, in front of us, is the finest Cedar of Lebanon in England. It is one hundred and three feet high, and has a girth of nearly thirty feet. But its great beauty lies in its wonderful spread and the perfect symmetry of its branches, many of which are as large as ordinary trees. This was planted in 1761."

"There are some others very fine just here," I observed, pointing to two other grand specimens near by.

"Yes; these three are a great feature of the park. There were originally a thousand Cedars, but only one hundred remain."

And now, taking the path through the trees, we crossed the road and entered the enclosure. Through handsome iron gates I caught a glimpse of a broad, well-kept grass path, flanked by wide herbaceous borders in the full-

ness of their summer beauty. Just inside is Mr. Brock's house, gay with Fuchsia Riccartonii reaching to the roof, and the old Tea Roses, Devoniensis and Anna Olivier, draping the side wall, facing full south.

"Anna Olivier is one of the best Roses for a warm wall," said Mr. Brock. "It flowers profusely and continuously."

WELL-PLANNED BORDERS.

"You carry out the plan of having broad patches of colour in the borders?"

"Yes; the aim is to present a mass of one shade, but with no violent contrasts. Thus the blues tone into pinks, and these into yellows, and so on. We contrive to have these borders at their best in July, but they are attractive throughout their season."

Attractive they certainly were, and as we walked along new beauties constantly revealed themselves, for the borders are not in a straight line, but curve, so that the full length is not seen at once. Roses on pillars serve to break up the level, though even without them there would be no monotonous gradation from back to front, as tall plants are judiciously interspersed, and brought to the middle of the border. The Delphiniums were over, but rich blue was provided by Spark's variety of the old Monkshood, Aconitum Napellus, and a bicolor was also very effective. Galega officinalis and the white variety are planted with no niggard hand, and the pale blush of G. o. carnea is very pleasing. A broad patch of Salvia virgata nemerosa, which I have mentioned as making so striking a bed in the "New garden," was musical with the busy hum of bees; and near by the golden-yellow Anthemis tinctoria sparkled in the sun. Monarda didyma, the Sweet Bergamot, with its bright red colouring, proved its worth in another place; and Potentilla Gibson's Scarlet was well disposed in front of taller plants.

STOCKS NOT WET WEATHER PLANTS.

The one flower which, as Mr. Brock pointed out, has not been successful, is the Ten-week Stock.

"The wet season is evidently not favourable to them," he remarked; "whereas Antirrhinums are good in all weathers, and are a splendid stand-by. A fine border plant is Campanula lactiflora, which grows five to six feet high, and is a pretty shade of blue. Gladiolus America is blooming earlier than usual. Here is another fine thing for a big border, Salvia Perfection. Sidalcea Listeri is good, and Phlox Lindhead Beauty is one of the best of its type."

"You do not seem to employ many stakes?"

"No; instead we use Pea-sticks largely. The plants then require but little tying—just here and there only—and they look more natural."

"The Roses on pillars make a good show."

"They are mostly Wichuraianas. Excelsa is one of the best, and it stands the rain better than Crimson Rambler. We have both these varieties on the same pole; and when Crimson Rambler is past its best we cut out the old growths and give play to Excelsa, which is then coming on. So we get a longer season."

THE ROCK GARDEN.

A turn in the path brought the rock garden into view. Up to 1908 the hollow in which it lies was practically a rubbish heap, with sheds dotted about, and on the banks were Potato pits. But by 1913 the alterations were completed, and it is now one of the distinguishing features of the gardens. Surrounding it is a hedge of the half-hardy shrub, Pittosporum undulatum, raised from seed from the old tree on the lawn. It is kept closely cut, and so does not flower, but its beautiful foliage makes it a choice and uncommon hedge.

"The middle of June is the best time for the rockery," said Mr. Brock, "although we are not without flowers now. Here, as elsewhere, we go in for broad plantings, Rock Roses in big blocks of one colour—Magnificent is one of the best; Saxifrages, Sempervivums, and Sedums in all the best varieties; and all the Alpine forms of Dianthus are represented. Raoulia australis is splendid for a dry spot, and Tunica Saxifraga loves a hot place; and a beautiful thing is Globularia nana. Campanula Mayii has stood here for seven years without injury; and so has Asperula suberosa, which does not receive the protection of a glass covering in winter. The Geraniums are well represented, and you see a lot of them are in bloom. The finest, I think, is Geranium lancastriense. This Sedum now in bloom is muralis—a lovely thing in pink, while in autumn the coppery foliage makes a good bit of colour."

Along the top of the rockery, where the Potato pits formerly stood, are now beds of Roses, with Ramblers at the back, and trailing down the bank are species such as R. pomifera, already attractive with its scarlet fruits.

The kitchen gardens occupy seven acres of ground, and in our walk round them I inquired about the fruit prospects for this season.

"The Apple crop will be very moderate," was the answer; "but we cannot expect anything else after last year, which might be called the crop of a lifetime. The young trees, however, are carrying decent crops. Some varieties do better on our light soil than others. Bramley's Seedling, for instance, does not crop well, although the quality is excellent; but Rival is good in all respects, and so is Newton Wonder."

THE HERBACEOUS BORDERS IN THE GARDENS AT GOODWOOD.

Plums and Peaches occupy the south wall. Early Gage was rapidly approaching the ripe stage, and would be ready in about ten days' time; while some of the Peaches, Duke of York and Wellington, were already ripe. Salway, I was told, is another good Peach, which ripens outdoors in October. Trained as lean-to cordons are many Apples and Pears, which, from their shape, serve to support the nets protecting the wall fruit.

OLD STANDARD FIG TREES.

One thing which greatly interested me in this garden was the row of twenty or twenty-five standard Fig trees. They are very old, with immense trunks, and, Mr. Brock informed me, were mentioned as being very old as far back as 1837, but as many as two thousand fruits are gathered off them each year.

In the houses Peaches and Nectarines are the most important crop, and they are chiefly timed for race week, when at least eight hundred to one thousand fruits are used, mostly Royal George. Other favourite varieties are Early Rivers, Cardinal, Napier, Violette Hâtive, Humboldt, Duchess of Cornwall, and Peregrine.

No Vines had been grown—owing to lack of fuel—for the past five years, but this year they were started again, and give good promise. The Orchid house is now devoted to Peaches, and others which formerly had plants now carry crops of Tomato Moneymaker and Best of All. One Tomato house was formerly the Cucumber house, and before that used to have Pineapples.

Out in the open a good batch of Malmaison Carnations were standing, protected by rough lights, and I asked Mr. Brock to tell me his method with them.

"They are planted out from 4-in. pots at the end of March, and flower here three weeks later than if grown inside. They are layered in the same place, and later potted up into small pots, and kept on shelves for the winter. A few are potted on to give large plants."

W. J. CHITTENDEN.

A DWARF ASTER.

Aster sub-cæruleus is a dwarf, early-flowering perennial of the family of Michaelmas Daisies. It bears beautiful mauve-blue flowers, with an attractive orange-yellow eye or centre, and they often measure three inches across. The leaves are of medium length, and grow closely together, forming tufts, while the flower-stems are long and strong, bearing the flowers well above the foliage.

The habit of the plant being compact, it is an excellent subject for the rockery, or the front of the border, and it is also very suitable for growing in pots for the cool greenhouse or conservatory.

If seed be sown during July or the early part of August, the plants will bloom at the beginning of June next year. Very strong specimens may be selected from the batch of seedlings, placed singly in small pots, repotted in due course in September, wintered in a cold frame, and transferred to a greenhouse early in February. If the structure is heated, blooms will open in March. Fairly strong plants bear about twenty flowers, so that each specimen forms a striking object in the house.

For late summer-flowering, plants may be raised from seeds sown in September. Sow the seeds very thinly in shallow drills in a nursery bed, and transplant the seedlings in an open border before finally putting them in their flowering quarters.

G. R.

driven by pressure, always spreads out when it escapes from a narrow aperture, such as the end of a pipe, and we should naturally expect it to do the same when it emerges from the stalks with which leaves that do spread out are provided in a greater or less degree. Another analogy will make this still clearer—the analogy of a gas-flame, which may be made more rounded or more elongated by diminishing or increasing the pressure.

November 6th.—I have just come across a list, by Mr. W. Paul, of Roses which he calls "ever-blooming." "I do not mean to imply,"

MR. JAMES BROOKES.

he explains, "that they will bloom all the year round in this climate out of doors, but they will do so if removed at the end of the Rose season to the warmth and shelter of the glass-houses." As to the value of such Roses there cannot be two opinions. I have, therefore, made a note of the names; several are unknown to me, but to all the others I have attached letters to show to which classes they belong. Here is the list:—*Aurora* (H.T.), *Boadicea* (T.), Camoens (H.T.), *Chameleon* (T.), Comtesse Festetics Hamilton, *Corallina* (T.), *Dainty* (T.), *Empress Alexandra of Russia* (T.), *Enchantress* (T.), *Fairy Queen* (T.), *Fortuna* (T.), G. Nabonnand (T.), General Schablekine (T.), Gloire des Polyanthas (Pol.), Gruss an Teplitz (H.T.), Madame Abel Chatenay (H.T.), Madame C. P. Strassheim, Madame Eugene Résal (Ch.), Madame Laurette Messimy (Ch.), Mdlle. Germaine Raud, *Morning Glory* (T.), Papa Gontier (H.T.), Princess Alice de Monaco, *Queen Mab* (Ch.), *Salmonea* (T.), *Sulphurea* (T.), *Alexandra* (T.), Yvonne Gravier. I have looked out the Roses in this list raised by Mr. Paul's own firm, lest it should be thought that his purpose was merely to advertise them, and have placed them in italics. There may, of course, be one or two others among those which I do not know. He states that they flower "continuously from June until growth is arrested by the autumn frosts," and that alone entitles them to consideration, even where there is no intention of potting them up afterwards and removing them for further flowering to the greenhouse.

November 7th.—Much has been written about the fertility of virgin soil, yet if I had to choose between that and soil which had been worked for generations—worked properly, of course—I should not hesitate to choose the latter. I have had gardens new and old, and while the former were a perpetual source of trouble and dissatisfaction, the latter never failed to yield good crops. One of the most prolific gardens I know—the garden of Rushen Abbey, in the Isle of Man—is also one of the oldest, the Raspberries grown there for a firm of jam manufacturers being exceptionally fine. And near here, in the gardens of Beeleigh Abbey, plants of all sorts seem to grow like weeds, so luxuriantly that the picturesque old ruin is almost hidden.

H. C. DAVIDSON.

(To be continued.)

FAMOUS GARDENERS AT HOME.

No. 110.—MR. JAMES BROOKES, AT THE GARDENS, TOTTERIDGE PARK.

AT the first exhibition of the National Chrysanthemum Society this season, the first prize in the cut-bloom section was awarded to Mr. James Brookes, head gardener to Mr. W. J. Neuman, of Totteridge Park, who exhibited twenty-four blooms of eighteen of the best mauve Japanese varieties. This was not the only prize taken by Mr. Brookes, who also gained second for an exhibit of two vases of twelve blooms. But Mr. Brookes is a good deal more than a remarkably successful grower of Chrysanthemums. Thanks to the readiness of Mr. Neuman to fall in with his views, and to his encouragement and co-operation, he has been able to convert what was little less than a wilderness when Mr. Neuman became the owner of Totteridge Park, into one of the most charming gardens in Hertfordshire. He had, it is true, the great advantage of beautiful natural scenery to assist him at the outset, but bearing in mind that the once historic seat, erected in the fifteenth century, had been allowed to fall into an apparently hopeless state of dilapidation, it may be imagined what the surroundings were like when, about six years ago, soon after the restoration of the house, Mr. Brookes addressed himself to the task of improving the gardens. One of the important additions is the Italian garden, which forms a courtyard to the house, and here, in starting, my attention was attracted by a bed containing a large number of Cosmos bipinnatus still in flower. I asked Mr. Brookes if he usually got these plants to flower well, and he said:—

"Yes, ours always flower very freely from July until the frost cuts them down. We have three shades of Cosmos, and the intermingling shades of the single Dahlia-like flower are very pretty earlier in the year. I believe that most persons can grow Cosmos with any amount of foliage—which is very feathery and elegant—but there is a difficulty in making them flower well."

"How do you overcome it?"

"By avoiding the mistake of giving the plants too much manure. This soil is also poor, which, in the case of Cosmos, helps rather than hinders. If they have much manure they grow too strongly to flower, though, of course, the foliage always looks nice, and is useful."

"What number do you usually grow?"

"About two hundred. I plant them out, just the same as any other hardy annual, in the middle of spring."

"Do you save your own seed?"

"Yes, always. I have been growing Cosmos for some time. People say sometimes that they are not worth growing, but as we get a great quantity of blooms from them, we naturally think otherwise. They are fine flowers for vases, and they can be cut with good, long stems."

"Have you shown any?"

"On one occasion I exhibited a big vase, which swamped everything else, and easily took first prize. Each plant makes a bush as big as an ordinary Dahlia. To amateurs who would like to grow Cosmos, I cannot give better advice than to put them on poor soil. They should be starved."

THE SUN-DIAL IN THE GARDEN AT TOTTERIDGE PARK.

Near the courtyard is the ground, open to the south, on which Chrysanthemums are grown, and Mr. Brookes remarked that on the night of the gale in September he lost two hundred blooms.

"Chrysanthemums are your biggest feature?" I inquired.

"Yes, we go in largely for them. The Japanese varieties are our speciality."

"You prefer them to the Incurved?" I said,

as we crossed over to a house full of splendid specimens of the Japanese.

"Mr. Neuman thinks that they are more graceful than the Incurved, and so do I. Last year we took twenty-five first prizes for Japanese Chrysanthemums. In fact, we were awarded first prizes in every show where we exhibited our blooms."

"How many have you grown this year?"

"About three hundred and fifty. In addition to those in this house, we are keeping back in a dark house a few of such varieties as Mrs. Elsie Fuller, Mrs. T. W. Pockett, and Mrs. Bagnall Wylde."

"Which do you consider among the finest varieties of your 'show' specimens?"

"Bessie Godfrey is certainly the best yellow that has been sent out. If you would like a selection, I cannot give better names than F. S. Vallas, M. V. Venosta, Australie, Mafeking Hero, George Penfold, Lily Mountford, Duchess of Sutherland, Mrs. Barkley, Mrs. J. Bryant, Miss Mildred Ware, W. R. Church, Mr. Guy Mileham, Lord Alverstone (a fine dwarf variety), Mrs. H. Emmerton, Mrs. James Lewis (a good white, late but useful), Mrs. Mease, and Madame Carnot. Florence Penford is also coming on very well."

When I had spent some time in examining the collection of Japanese, we crossed over to another house, and Mr. Brookes continued:—

"We grow about two hundred of smaller Chrysanthemums in 'thirty-twos,' for the purpose of decoration indoors, and also some singles. The doubles include Miss Mildred Ware, W. R. Church, Godfrey's Pride, Sensation, M. V. Venosta, and Mrs. T. W. Pockett."

"What about bush varieties?"

"We always have a big batch of the various bush varieties grown in our herbaceous borders. We have also a number of late-flowering Chrysanthemums, including L. Canning and Golden Gem. These flower at Christmas. Indeed, we keep Chrysanthemums of one kind or another going from September to February. I admit that they need a lot of care and attention. But plants that will supply us with flowers for five months are worth looking after."

"Have you suffered from rust?"

"Yes, I have had it, but I do not find much difficulty in getting rid of it. For one thing, I never put new varieties of Chrysanthemums with the stock until I am quite certain that all the rust is killed."

"How do you kill it?"

"I mix up XL All wash with the least drop of paraffin, and dip the plants in two or three times, or as often as they seem to want it. At the present moment there is not a bit of rust on the place."

"You have some nice Crotons in the stove; but, more charming than the Crotons, is the Allamanda on the back wall."

"Yes; that Alamanda Hendersonii has covered the wall with its lovely orange-yellow flowers. It has been flowering for five years. I cut it back hard every year. Freesias and Cyclamens do well in this house, and there are some healthy-looking plants of Begonia Gloire de Lorraine."

Passing into a long corridor, which leads from the house into the commodious stables, I noticed a Lapageria flowering well, an admirable specimen of Rhyncospermum jasminoides, and some Swainsonia galegifolia and alba."

Totteridge Park—South Front.

"That pretty, yellow, Pea-shaped flower, Cassia corymbosa," observed Mr. Brookes, "lasts from August until Christmas. I also cut that back, though only because of want of space. Another plant that flowers for many months is Streptosolen Jamesonii, and one of the most beautiful flowers in this corridor is Hoya carnosa. It is in full bloom in August, and there are thousands of pinkish-white, wax-like flowers. The bees like them immensely, and they are very useful for gentlemen's buttonholes, as well as ornamental."

"What is the name of that superb blue flower, with the elegant green foliage?"

"Pellionea elegans. It is supposed to be a stove plant, but, as you see, it thrives in what is practically a cool house. There is no flower, I believe, of a deeper, richer blue. It starts flowering in August, and keeps on until Christmas. The flowers drop, but they make a splendid show. We have only had the plant for a couple of years. On the other hand, the Myrtle, at the end of the corridor, is an old plant, which still flowers and fruits freely."

"Do you grow many plants of Salvia splendens?"

"A large quantity. We use them in pots for house decoration. They are not difficult to grow. I strike the cuttings in the spring, and pot them on. Splendens is the most ornamental variety, the contrast between the deep red flower and the foliage being so effective. Salvias last until Christmas. The spikes keep lengthening out. In the pits close by are double Petunias, Calceolarias, Cinerarias, Cyclamens, and bedding Geraniums."

"What is the length of the herbaceous border which runs from the west door of the house?"

"About a hundred yards by about fifteen feet wide. We grow in the border, among other things, Sunflowers, Asters, Antirrhinums, early Chrysanthemums, Montbretias, Lilies of various kinds, Funkias, Rudbeckia, and Gypsophila."

At the end of the herbaceous border are an aviary and a pheasant house, while in parallel with it is the tennis lawn. Mr. Brookes called my attention to a very remarkable tree on the lawn. It is generally described as a Hen and Chickens, but it is really an Abies picea, of gigantic height, probably over a hundred feet, and round it are a number of trees which have layered themselves and grown, some of them being sixty feet high. On the lawns, which are approached from very broad and well-kept walks, with a sun-dial at the end of the central one, and a pair of whale's jaws at the end of another, are many other fine trees, chiefly Copper Beech, Abies of various kinds, Cupressus, and Cedars of Lebanon, while on the left hand is a representative collection of shrubs, the most prominent being Rhododendrons, variegated Hollies, Laburnums, and Yews. At the end of the lawns we came to the wild garden, and here I asked Mr. Brookes the extent of the gardens.

"About ten acres," he replied. "The wild garden is filled with bush Roses, double Gorse, and Rhododendrons, with Daffodils at the bottom."

"But you have a Rose garden also, with a singularly effective pergola."

"The pergola divides the Rosery on the right from the old-fashioned flower garden on the left. The whole of it was formerly a kitchen garden. Underneath the pergola are all the best of the wild British and American Ferns. The old-fashioned flower garden, as you see, includes a pond with a rockery all round it. The Lilies in the pond are chiefly Nymphæa alba."

"What do you grow in the rockery?"

"Rock Roses, the early-flowering Iris, Arabis, Iceland Poppies, Alyssums, various Ferns, Ericas, Aubrietias, and wild Strawberries."

"And in the flower beds?"

"Fuchsias, Nasturtiums, Lavender, Carnations, Pansies, Geraniums, Sweet Williams, Calceolarias, etc. In the orchard, just beyond, there are about three and a-half acres of Apples, Pears, Plums, and Cherries, planted in rows."

"You have Roses below the pergola?"

"A few kinds, such as Golden Gate, Beau Brown, Merveille de Lyon, Maman Cochet, Catherine Mermet, The Bride, La France, and Duke of Edinburgh. In the Rosery we have some of the new and best varieties, including Souvenir du President Carnot, White Lady Killarney, Madame Abel Chatenay (one of the best Roses ever sent out), Souvenir de Madame E. Cauvin, Antoine Revoire, Lady Charlotte, and Mrs. Robert Garrett. The beds are filled with one kind and edged with another."

"You might give a few illustrations."

"One big bed is filled with Captain Christy, edged with Golden Fairy; another with Mme. Darling, edged with Crimson China; and another with La France, edged with The Bride; Souvenir van Houtte, edged with L'Ideal; Hon. Edith Gifford, edged with Premier Bourse; Duke of Teck, edged with Perle des Rouges; and Madame Lombard, edged with Cecile Brunner. Two beds

beds at the end of the Rose garden are devoted to Daffodils."

"But there are two other beds, with a brave show of Phlox and perennial Asters?"

"Yes, the Asters are rather a feature; the varieties include Vimineus cassiope, ericoides, Clio, cordifolius, Chapmanii, Novæ-Belgii St. Patrick, and others. The autumn borders are planted in front with early-flowering Chrysanthemums, the middle with Cactus Dahlias, and the back with Hollyhocks."

"How large is the kitchen garden?"

"An acre inside the walls, and one out. The usual fruit and vegetables are grown. The varieties of Strawberries are Laxton, Mentmore, Royal Sovereign, Monarch, Gunton Park (a splendid Strawberry), and Leader. We follow Raspberries with Blackberries."

"Have you grown Blackberries for some time?"

"Ever since I have been here. I treat them exactly the same as Raspberries. The fruit is fine, and the flavour is good. We get a great quantity every season. On the inside wall, facing west, we have Plums; on that facing south, Peaches; on that facing east, Pears; and on that facing north, Morella Cherries. Of vegetables, there are beds of Asparagus, Celery, and Leeks, Kale, and Brussels Sprouts."

"What do you grow in the glasshouse here?"

"Tomatoes. Just now we are using it also to dry Onions, because it is impossible to dry them outside. We force Roses through the winter. I cut hundreds of flowers out of this little house. There are about three dozen Arum Lilies, which begin to flower at Christmas, and go on until Easter."

On our return, we stayed for a while in another part of the flower garden, close to the Chrysanthemum house, where we started.

"Some of these beds," said Mr. Brookes, "are filled with Geraniums (Mrs. Pollock and Flower of Spring), Fuchsias (Mr. Marshall), edged with Lobelias, and Gaillardias, of which we have had an enormous quantity."

"Do you go in for Irises?"

"Under the wall in this part of the garden we have, in spring, a border completely filled with German, Spanish, and Siberian Irises. I like to see a big border filled with one kind of flower. It is something to look at, and you can go on cutting from it."

"How many men are employed in the gardens?"

"Six. I mentioned that I came here with Mr. Neuman, but I was with him at Whetstone House, close to the railway station, for two years before he came to Totteridge Park."

"Are you a native of Hertfordshire?"

"No, of Herefordshire. My father is a gardener, in charge of the gardens at the Hereford County Asylum, and I was apprenticed under Mr. John Cranston, of King's Acre. My first appointment was that of foreman at Thing Hill, under Mr. Edwards, an uncle of mine, and a great fruit-grower. I came from Thing Hill to Whetstone, except for a short interval, when I was with Messrs. Wetherall, the well-known Rose-growers, at Finchley."

"Have you been showing ever since you came here?"

"Yes, all the time. I have shown Chrysanthemums, fruit, and vegetables, at most of the local shows. In 1902 I won the Wells silver medal for Chrysanthemums; in 1897 my exhibit of forty-eight Japanese varieties carried off the silver cup and medal at the Highgate Society's Show. I have also been awarded by the National Society the little silver medal, as well as two silver medals by the Highgate Society. I never came away from a show yet without some kind of prize. Mr. Neuman takes a great interest in the shows, as well as in the gardens, and generally attends them. He encourages me to do my best in every possible way."

ALFRED WILCOX.

LETTERS FROM A LADY GARDENER.

No. 67.—POTATOES, AND PLANTS FOR DRY PLACES.

DEAR KATE,—I am sorry to hear that your Potatoes have been a failure this year from disease; everyone around here has suffered in the same way (except your humble servant), for the continual downpour of cold rain is about as bad for this crop as any weather could possibly be.

I told you in the spring that I was experimenting with new Potatoes, and would let you know the result, so here it is. The varieties selected were three early Potatoes and three late kinds (two of the very best and newest from Dobbie, Carter, and Sutton), specially chosen for robustness and disease-resisting properties, and they were planted rather late, in the middle of April, in a field free from Potato-disease (for the bacillus lives in the soil), on the sloping side of a sunny hill, the soil being rather light, gravelly loam. It was enriched with a mixture of cow-

DIANTHUS HEDWIGGII.

manure and special Potato manures; and I think the late planting was in favour of the crop, because the plants received no check from late frosts, but went ahead steadily from the first. The result has been a very fine crop of Potatoes, most of the varieties being absolutely free from disease, and only one or two showing slight symptoms of it, involving but very little injury to the tubers.

On looking into the matter, I find that those Potatoes which have been introduced during the last few years are the best to grow, and we ought to avoid the older varieties, for this reason:—Nature's plan of reproduction is from the seed; ours, on the contrary, is from the "sett" (or cut-up tubers), and this custom inevitably weakens the plant year by year, until it becomes decrepit, and falls an easy prey to the bacilli which lie in wait for it in the soil. But, fortunately, our horticulturists are constantly hybridising between the best and strongest varieties, specially selected for robust habit and disease-resisting powers, so that we have our remedy in choosing the young (or newly-introduced) varieties, and avoiding all those which have been grown for a number of years. Perhaps you will say you can't afford to buy these fine new kinds, which certainly cost more (as seed) than the rest. But where is the economy of wasted labour, manure, and time, with the result of a poor crop of diseased tubers at the end of it?

Another great mistake is to plant Potatoes year after year in the same plot. This, too, weakens the plant, for the soil becomes what is called "Potato-sick," and is simply a nest of bacilli, which are quite ready in the spring to devour the next unfortunate crop.

So, order some gaslime, and purify your garden (where the diseased Potatoes have been) with this; but, even then, it will be safer not to crop the same plot with Potatoes for a season or two, but to carry out a proper rotation of crops. If you should be troubled again with diseased Potatoes, never let the gardener dig the haulms or bad tubers into the soil, but have them burnt as soon as possible, for they are so much seed of the disease, and will infest either the soil or other tubers if left. Then, next spring, choose some fresh, pure ground, and order seed of some of the newest and best kinds, such as Discovery, an extraordinarily prolific Potato, which has not shown the smallest trace of disease in my garden this year), the Factor (a fine Scotch Potato, absolutely free from disease, and a grand cropper), or Goldfinder, which produced an equally fine crop of good tubers, quite disease-proof.

We are now eating enormous Potatoes from Royalty, a grand early variety—many of them are so big that they do best baked in their skins (a very wholesome way to cook Potatoes); the British Premier, too, produced extremely fine tubers, and was free from disease, and Ninety-fold was equally good. The tubers from Discovery and the Factor are not so large, but both of these varieties produce a remarkable number of medium-sized Potatoes, very useful for cooking, and all of the above-mentioned Potatoes cook well, and are of good flavour, which cannot be said of all varieties.

In answer to your other question (what to plant under the warm south wall of your house, where it is very dry), I should advise you to put in Indian Pinks (Dianthus Hedwiggii), which are so lovely for dinner-table decoration—especially the fringed varieties (laciniatus), of which I send you a photograph—as soon as you can, getting stout seedling plants, sown last May, if possible. Wallflowers, too, of the best varieties, are lovely for such a dry place, and Helianthemums (Rock Roses), with purple Aubrietia, yellow Alyssum, and the double, white Arabis, all of which will make the front of your house a gay place in the spring. If you wish to have something quite uncommon, order a plant of Iris tectorum, and put it in at once. We have a most flourishing group of this (one of the loveliest of the Iris tribe) and Iris fimbriata, in pale blue; both grow together close to the south wall of the conservatory, on a gravel terrace, and do well with only the protection of a pane of glass sloped over them in winter, which keeps off the worst of the rain and frost. Iris tectorum is the flower which decorates the roofs of the houses in Japan; it is fringed, and the purple, gold, and creamy tints of the flowers are most beautiful. Iris fimbriata is said to be too delicate for the open air, but we don't find it so when grown in this way, and in well-drained, gravelly soil. Both belong to the rhizomatous group of Irises, and they throw out surface-rooting rhizomes into the gravel, some of which we are now going to plant on the top of our stokehole—a peculiar sort of place, you will say, for flowers. But, then, it is covered with coarse wire netting, all over the roof, and between this and the netting there are turves laid (which have previously been kept dry in a shed until the roots of the grass are dead), so that I don't see why Iris tectorum should not make itself as happy on this roof as on those of the houses of Japan. But this, again, is an experiment; we are always experimenting with something, and I think a great deal of the pleasure of being your own head gardener lies in trying new plans.

We have a lot of flowers already on the stokehole roof, which was, before it was planted, quite an eyesore from the windows, but now

SAMUEL BROOME'S MEMORIAL.

All lovers of flowers who live in London, or who have been frequent visitors to the central part of our great metropolis, will have heard of the work, if not of the name, of Samuel Broome. For thirty-eight years, as gardener to the Honourable Society of the Inner Temple, it was his living task to contribute to the pleasure and innocent enjoyment of thousands of those who made the Temple Gardens their frequent resort, and especially to the delight of the children of this great city, who found in that ancient pleasaunce, not only a playground, but a charming retreat from the crowded streets.

Samuel Broome, though a famous grower of the chrysanthemum, was much more estimable as a man, from his great natural kindness and good-natured frankness of disposition. We have therefore great pleasure in recording the fact that some of his many friends have subscribed to erect a monument to his memory above his last resting-place in Nunhead Cemetery. Of this monument we now furnish an illustration. It consists of a column of Aberdeen granite eleven feet in height, standing on a double platform, and is embellished by a wreath of chrysanthemums in white marble.

Samuel Broome's Monument in Nunhead Cemetery.

No man in his sphere was more deservedly popular or better known than Sam Broome, as might be gleaned from the numerous regretful notices of his death in the press of all rank We may conclude in the words of *Punch*:—

"Never was simple man more glad than thou,
Never were gentler pride and joy than thine—
Pleased to see pleas'd crowds round thy *pompons* bow,
Children, maids, barristers of parchment brow,
Who rarely noticed snu's or blossom's shine.

"Along Thames bank thy blooms stood brave and bold,
The brighter for the brick and mortar round:
And if *thy* flowers were flowers of gold,
So innocent none grew from Temple mould,
None so enriched, yet cumbered not, the ground.

"How oft, when Autumn daylight in the West
Was blended with the City's lurid flare,
Pale cheeks and aching brows thy flowers have blest,
That breathed a breath of Nature and her rest,
On brains o'er-wearied with law's cark and care.

"Farewell to thee, kind, honest, old Sam Broome."

THE GARDEN IN THE HOUSE.

CULTURE OF PLANTS IN ROOMS.

(*Continued from p.* 128.)

The task is more difficult, when, along with a suitable arrangement for culture, the decoration of the apartment is also aimed at. The usual positions selected for this purpose are the corners of the room, and the parts of the walls between the windows. These last positions are generally those which, from considerations of space, people devote to plants when there is not sufficient room for them in the rest of the apartment, but for the culture of plants they are most unsuitable positions, because they are either too far from the light, or the light from the windows cannot fall directly on them. Corners which are opposite the windows receive, at least, the light directly, and so are far more favourabe for the culture of plants than, for example, the corners of the wall in which the windows are placed, or the parts of the wall between the windows, which although nearer to the light, do not receive it directly. Therefore, when the culture of plants is confined to the room itself, and the specimens cannot from time to time be removed to the plant-house, these positions should either not be furnished with plants, or a selection should only be made from the few kinds

Plan of Room with Plants.

which succeed in rooms even when they receive but little direct light, as, for example, Plectogyne variegata (which cannot be surpassed in this respect), some of the taller kinds of Anthurium, with long and broad leaves, and many varieties of ivy. In the immediate vicinity of the fire-place, no plants will last long.

Where it is desired to decorate a room permanently with handsome hot-house foliage-plants, the arrangement must be such that all the plants may be exposed to the direct light from the windows and yet be placed not too far from the fire-place. A few creepers that will thrive in the shade, as the ivies and Cissus antarctica, the plants before-mentioned, with a judicious selection and arrangement of the furniture must then help to fill up the plan. On festive occasions, when a greater number of persons than usual crowd one's rooms, any plants that are in the way can be removed for twenty-four hours without injury to the unoccupied corners of the room, which they will serve to decorate for the occasion. But let not the amateur be seduced into making the experiment in winter of ornamenting cold staircases with plants placed around heated stoves, even for a short time. If he does so he will lose, in a few hours, all

Brotherston, Robert Page. Born at Ednam, Berwick, February 7, 1848; died at Old Scone, Perth, December 21, 1923. A frequent and welcome contributor to the *Gardeners' Chronicle* for many years. In 1874 he became gardener to the Earl of Haddington at Tyninghame, whence I had a letter from him last autumn on the occurrence of *Erinus alpinus* at Morham, East Lothian, where it is adventive. He published "The Book of Cut Flowers" in 1906, a useful work which had a deserved popularity. He had a good knowledge of British plants. See *Gard. Chron.*, September 1, 1923.

more skill, and more care than even the garden proper.

December 23rd.—The importance of good seed is the subject of an article in "The World's Work." Professor Holden has been preaching this gospel in the United States. He has also practised what he preached. As manager of a 20,000-acre farm, he has, in the first year, increased the yield by 10,000 bushels. His remarkable results have arrested the attention of the farmers of Iowa, and now he has to use a special train for carrying his good seed to them. It is stated that, through his agency, millions of bushels have been added to the exportable corn of a single State.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 169.—MR. CHARLES BROWN, AT THE GARDENS, LANGLEY HOUSE, ABBOT'S LANGLEY.

AMONG the veteran gardeners who have earned a solid reputation in the horticultural world, Mr. Charles Brown is entitled to a prominent place. For no fewer than thirty-two years he has been head gardener to Mr. Robert Henty, J.P., first at Nazing Park, Broxbourne, and for the last eighteen years at Langley House, Abbot's Langley. He was in a similar position for three years, at Milnfield House, Great Amwell, Ware, and this experience, which was preceded by that gained in the various departments of gardening, would alone render him a high authority. But he has also been a very successful exhibitor of Chrysanthemums and vegetables, and includes among the two hundred odd prizes and awards he has received, some for table plants. It is just twenty-one years ago since he obtained a first prize at the now defunct Westminster Aquarium. On the occasion of my visit, in the second week of November, to Langley House, which stands on high ground a couple of miles away from King's Langley station, in the heart of the pretty village of Abbot's Langley, Mr. Brown suggested that before we looked round the pleasure grounds we might inspect the extra kitchen garden, a little distance away from the house. An interesting fact is that, by the kindness of Mr. Henty, who is now ninety-six years of age, a portion of this garden is devoted to allotments for the benefit of the people employed on the estate. The privilege is much appreciated, and acts as a stimulus in some cases. One allotment-holder, Mr. Coleman, the cowman, spends most of his leisure in cultivating his plot of land, and keeping his own garden in good order, with the result that at the local show he was champion prize-taker.

"Speaking of prizes," I said, as we stood by the Celery beds, "you have been very successful, I believe, in showing Celery?"

"Yes, I have done pretty well with Celery, and other vegetables, since I have shown at the National Chrysanthemum Society's shows."

"How long have you been showing there?"

"About twenty-one years. I used to show at Watford, and other local shows. At the last Palace show I exhibited a dozen heads of Celery of two varieties. The varieties were Standard Bearer and Major Clarke."

"You grow a considerable quantity?"

"Twelve rows, altogether. With regard to cultivation, I dig the trenches well, quite two feet deep, fill up the bottom first with manure and soil, and plant on the top. I used to feed freely with artificial manure, but I found that the Celery tasted of it, and now we only give plenty of water, and, occasionally, a little farmyard manure-water."

"Onions, you also show?"

"Yes, every year. They are grown on the same piece of ground. I dig it for them three spits deep, putting manure in the bottom spit. The two best varieties are, I find, Sutton's Select and Ailsa Craig. I treat Leeks in much the same way as Celery. I won a third prize this year for them in open competition. The varieties are Sydenham's Lion and Sutton's Champion."

"Which varieties of Parsnip do you prefer?"

"Tender and True, and Hollow Crown. In growing Parsnips I generally make holes with a crowbar, fill it up with fine soil, and sow the seed in the centre of the hole."

"What about Turnips?"

"I show Turnips also, and have had prizes for them. The varieties are Veitch's Red Globe, and Sutton's Early Whitestone. One of the best Carrots is Sydenham St. Valery; and, of Beets, the Blood Red. I keep to the old sorts of Broccoli, Cooling's Matchless, Knight's Protecting, Snow's Winter White, Sutton's Late Queen, and Model."

"Your Red Cabbages are very fine."

"They are the Red Dutch. have taken a first prize for them several times. I dig the ground well, and manure well, sowing in the spring, and not, as some do, in the autumn. The varieties of Brussels Sprouts are Aigburth and Wrexton; and, of Cabbages, Savoy, Green Curled, the Drumhead, and Colewort, a very useful variety, which will stand the frost. Of Cauliflowers I grow four varieties; for early use I grow Early Snowball. I sow them in February, pick them off into boxes as soon as they are fit, and plant them out in May, in some good, rich ground, and they are very useful in June. I find that this does away with the old plan of keeping the plants all through the winter months. For succession I grow Early London and Walcheren, and Autumn Giant for late use."

MR. CHARLES BROWN.

"Have you taken prizes with Potatoes?"

"I took the first prize at the Potato Exhibition with a dish of Up-to-Date and Satisfaction. I have tried Northern Star, and it did very well, but, so far as I can judge, it will not be any improvement upon Up-to-Date. The latter I grow for the general crop, and a few of Triumph. We used to grow Magnum Bonum until a few years ago, but they diminished in size. Up-to-Dates are still doing well."

"Is the subsoil clay?"

"Here it is, but all the soil on the other side is gravel. The clay suits the late vegetables better, and the gravel the early."

Quitting the vegetable garden, we crossed the road, and paid our respects to the Chestnut tree, which is one of the wonders of the place. It is on the front lawn—which is purposely kept rough—and looks like a number of trees.

"What is the length?" I inquired.

"Forty-six yards, and it is thirty-six yards through. The centre, I expect, will die in a few years, as it is showing signs of decay; but the young branches are nearly independent of the old tree, and are flourishing. In May it flowers right down to the bottom, and is a remarkable sight."

"I doubt whether it would look more remarkable or impressive than it does now, a huge giant bereft of its foliage. I notice that the

LANGLEY HOUSE, ABBOT'S LANGLEY.

branches of all the trees on the lawn grow downwards."

"Yes, there must be something in the soil which draws them down."

"You have a number of fine specimens?"

"One of the finest is a Turkey Oak, but the landmark of Langley House, and, indeed, of the locality, is the Picea Nordmanniana, near the house, which stands quite twenty feet above the other trees, and can be seen for miles around. The Pinus strobus, with its lovely light green foliage, is also much admired. Other notable trees are Araucarias, Hollies, Sycamores, and Thorns, the latter quite dwarf."

Here we entered the flower garden, which is at the south side of the house. On the house itself are Crimson Rambler and Gloire de Dijon Roses, Wistaria, summer-flowering Jasminum, Pomegranates, which flower but do not fruit, and Ceanothus Gloire de Plantare.

"How many plants does the large centre bed usually require to fill it?" I asked.

"About eight hundred. We use a good many Begonias for bedding, and find that they do better than Geraniums. But we still grow a good many of the old pink Geranium, Christine. This year the Tropæolum speciosum on the top of the first pile bed was a mass of flowers. In this bed Aloysias and Phlox Drummondi are used. The centre of the second pile bed was Zea japonica (variegated Maize), the remainder being scarlet Geraniums. The principal varieties of Geraniums used for bedding are Golden Harry Hieover, Flower of Spring, Triumph d'Estelle, and The Czar."

"What is the length of the herbaceous border?"

"Seventy yards. The other, which you will notice at the corner of the flower garden, is fifty yards long. The varieties include Aquilegias, Aubrietias, Campanulas in variety, Daphnes, Celuvarias, Gypsophilla paniculata, Mertensias, Saxifraga Rhei superba and S. Boydi, Silenes, Frankenias, Eryngiums, Doronicums, Pentstemons in variety, Phlox in variety, Potentillas, Rudbeckias, Saponarias, Physalis, Harpaliums, and a good collection of Asters."

"Do Roses thrive on the natural soil?"

"On the contrary, we have to make the soil suitable for them. They will stand any quantity of water and manure. Tree Lupins are rather a feature. They are seedlings, of six or seven different colours. They last about three years."

"You have no conservatory?"

"No, but we use the glasshouse close to the second herbaceous border as a conservatory in the summer. At present it contains Azaleas, Camellias, and also Cinerarias."

"The grounds seem to be of considerable dimensions."

"They are about thirty acres, including the plantation of trees, in which are many Limes, Chestnuts, Oaks, Yews, and Hollies. As you may observe, we keep the leaves on the roots of many of the trees, and let them decay. I think it is a mistake not to do so."

In the kitchen garden proper, which we entered after a stroll round the plantation, I remarked on the number of Black Currant trees.

"We have about fifty, but we do not get a very large quantity of fruit off them, though they do fairly well. The soil is too light for them. The Yew which forms a hedge close to them is ten feet through, and sixteen feet long."

"You go in considerably for Strawberries."

"Yes, they do very well here, and we have very heavy crops. We grow them in three sections, destroying one section every year. The ground is dug two feet deep, and plenty of manure is used. The varieties are Royal Sovereign, President, Monarch, and the Viscomtesse Hericart de Thury. Of Raspberries we only grow Superlative."

"Do you make much of Runner Beans?"

"Yes, we have a considerable number. To show the mildness of the weather, I may mention that I gathered a dish of Beans one day this week. The variety is Ne Plus Ultra."

"What is your principal wall fruit?"

"There are a few Peaches on the walls, Noblesse, Royal George, and Rivers' Early. There is a very good row of Apple trees, and the crop was excellent. The best varieties are Lord Suffield, Keswick Codlin, Lane's Prince Albert, Cox's Orange Pippin, Devonshire Quarrenden, and Blenheim Orange."

"Considering the period of the year, the Dahlias are doing well."

"There are not very many, but the varieties are good. Among the Cactus are Harry Stredwick, Cycle, and Black Prince, and the best of the singles are Seraph, Queen Mary, and Isabella Warder. The Asters, growing in the same bed, include cordifolius elegans, ericoides alba, and Shortii."

Then we went into the houses, the first being the Peach house.

"In this house, which is sixty feet long," said Mr. Brown, "we grow Hale's Early, Noblesse, Prince of Wales and Rivers' Early."

"What do you grow in the frames close by?"

"Carnations, including America, Prince of Wales, Pride of the Market, Celia, and Mr. S. J. Brooks. Also Cinerarias, about a hundred of the stellata kind."

"You grow Francoas?"

"Yes, I raise them from seed. They are sown early in spring, pricked off when large enough, into small "sixties," and then potted on as required. I plunge them in cold pits for the summer months, flowering them during the winter, and they will also flower the following year. I grow nearly fifty, and have had them for years. Francoas should be potted in good loam, with a little leaf-soil and sand."

"You have Black Hamburgh Grapes in the Vinery?"

"Yes, and Foster's Seedling, Muscat of Alexandria, and Alicante. The Chrysanthemums are, of course, the feature just now."

"How many do you grow in pots?"

"About three hundred and fifty. I also plant a good many out in May, as I find them very useful for cut flowers, if the weather keeps open in the autumn; but if these are taken up at the end of September or the beginning of October, they do admirably for decorative work, and it saves a lot of labour through the summer. I grow a few Japanese and a few Incurved, and a great number of Pompons, and also the American Pompons, which are hard to beat. About seven years since, the Incurved were the best Show varieties. Now the Japanese have taken their place."

"Which do you consider the best for decorating?"

"Although we grow so many Pompons, I think that the Japanese and the Singles are the best. I should not advise anyone to grow the Reflexed varieties for decorating, but the best are Clara Jeal, Cullingfordii, Dr. Sharpe, Cloth of Gold, and King of Crimsons. I have lately been going in for the spidery Chrysanthemums, and showed some last year."

"You also grow a quantity of Japanese Anemones?"

"Yes, they and Pompons and Reflexed are now the principal."

"It would be useful to have the names of some you can recommend."

"Of Japanese Anemones I recommend Duchess of Westminster, John Bunyan, La Deuil, Le Chalonais, Mabel Miller, Mrs. Hugh Gardiner, Sir Walter Raleigh, Tam O'Shanter, and W. W. Astor. Some of the best of the large-flowering Anemones are Delaware, Descartes, Gladys Spalding, Gluck, Junon, Lady Margaret, Miss Annie Lowe, and Mrs. Judge Benedict."

"I should like a short list of Pompons."

"Black Douglas, Comte de Morny, Harry Hicks, Madame Marthe, Prince of Orange, Pygmalion, Golden Madame Marthe, Osiris, and Wm. Westlake are some of the best. Of the Anemone Pompons, the following are very good: Antonius, Bessie Flight, Emily Rowbottom, Magenta King, Miss Nightingale, and Mr. Astie."

"You do not grow the new Japanese, nor any Incurved?"

"No. But some of the best of the older Japanese are Australian Gold, Graphic, Madame Gustave Henry, Mutual Friend, Mrs. Barkley, Mrs. James Beisant, N.C.S. Jubilee, Simplicity, Soleil d'Octobre, and Souvenir d'une Petite Amie. Of Incurved, I can recommend Charles H. Curtis, Duchess of Fife, Empress of India, Golden Empress of India, J. Agate, Lord Alcester, and Queen of England. Of singles, Lady R. Buller, Eucharis, Ladysmith, Miss S. A. Robins, Miss C. Warden, Mrs. Walton, Pretoria, Purity, Miss Jessie Dean, and Miss Mary Anderson are among the best; and, of the spidery section, Arab, Cannell's Favourite, King of Plumes, Mrs. Filkins, Banqueterre, and Sam Caswell."

PRIMULAS AT LANGLEY HOUSE.

"Before we finish with Chrysanthemums, you might, perhaps, tell me a little about your system of cultivation,"

"I select the sturdy cuttings, about three inches long, but avoid sappy cuttings showing the bud. I put my cuttings in from the middle to the end of December; I place some singly in thumb pots, and some I put three or four in 'sixties.' For the drainage I use clean crocks and good fibre. The soil should consist of good loam and leaf-soil, with plenty of silver sand, mixed well together. I generally strike mine in a heated pit, being very careful to avoid over-heating. Early in February I examine them, and pot any of those on that require it. As soon as they get established I remove them to cold frames, as they should on no account be drawn. I then pot them on into 'thirty-two's,' and get them well established before putting them into their flowering pots, about the end of May or the first week in June, potting very firmly."

"Have you a large number of Primulas?"

"About a hundred plants. I like The Lady, which we have in different colours, and is very good for house and table work, but we also have some of the sinensis section. In the frames just here we grow a good many Campanulas, and, among other plants, Violets, chiefly Marie Louise. Bulbs are rather a feature, and include Liliums Harrisii, auratum, and lancifolium. Hyacinths, Narcissi, Roman Hyacinths, and Tulips are grown in quantity."

"And in the greenhouse?"

"One of the features is the number of Freesias. We have about fifty in pots. The variety is refracta alba. It is very easy to cultivate. I plant in August, keep the plants outside in ashes until they begin to shoot through, put them into a cold frame until they are proof against the attacks of frost, and then set them on the shelves inside, feeding them once a week with a little weak manure-water. The scent is very pleasant, and the flowers are very useful for house decoration."

"You seem to have a quantity of Zonal Pelargoniums?"

"The doubles are Gloire de France, La Favourite, Lord Derby, Apple Blossom, F. V. Raspail Improved, and Madame Thibaut. There are nearly twenty single varieties, including Mrs. S. E. Cabbo, Hyacinth, Snowstorm, Robert Hayes, Mrs. Gordon, Scott Turner, Winston Churchill, Mrs. C. Tudway, The Sirdar, Britannia, The Khalifa, The Mikado, Mrs. Pale Kouth, Swanley Single White, and King of Crimsons.

"In this house," continued Mr. Brown, "we have also about thirty plants of Aralia Sieboldi. It is a flower which lasts well. Other contents of this house include Dracæna indivisa, Amaryllis hybrids, and Grevillea robusta."

"And Orchids?"

"There are a few nice plants of Cypripedium barbatum, C. insigne, and C. Sanderianum; also Dendrobiums nobile and thyrsiflorum, Epidendrum ciliare, Cœlogyne cristata, and Aerides crassifolium."

"We ought to mention some of the contents of the stove."

"Three varieties of Asparagus are grown; and there are Poinsettia euphorbia, Plumbago capensis, Eucharis amazonica, Eulalia japonica, Pandanum Veitchii, Panicum variegatum, Dieffenbachia Verschaffeldtii, Crotons in variety, and Cyperus alternifolius."

"There is one omission. We ought to have the names of some of your large collection of Roses."

"The climbers are Reine Marie Henriette, Reve d'Or, Waltham Climber, etc. The principal Hybrid Perpetuals are Alfred K. Williams, Beauty of Waltham, Bessie Johnson, Captain Christy, Countess of Oxford, Coquette des Blanches, Duchess of Bedford, Gloire de Ducher, Gloire de Margottin, and Her Majesty. The six best Teas are Belle Lyonnaise, Kaiser Wilhelm, Perle de Lyon, The Queen, Souvenir de Lady Ashburton, and Souvenir d'un Ami."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 125.—THE JAPANESE WINEBERRY, AND HIPPEASTRUMS.

DEAR KATE,—If you have not already planted some of the new fruits, the Loganberry and the Japanese Wineberry (Rubus Phœnicolasius), you should do so without loss of time, for they are both most valuable fruits, especially the Wineberry, which is a handsome plant, with crimson stems and silver-lined leaves, so that it is an ornament in the garden, as well as a most useful dessert fruit, coming in just after the Raspberries, during August and September. The berries are like Raspberries, with no hard core; but they have a distinct and most refreshing flavour, and are clear cornelian-red in colour, and, as for the crop both of these new fruits bear, it is enormous. We treat them exactly the same as our Raspberries—*i.e.*, cut out all the old wood which has borne fruit directly the crop is over in the autumn, leaving only the long, strong shoots they throw up from the base, yearly. These are often fourteen or sixteen feet in length, and we then bend these over in arches (so as to bring them within reach to gather), and sprays of bloom and fruit appear in spring at the axil of each leaf. I have sometimes counted the flowers and berries on one spray; they run from fifty to seventy-five, as a rule, so you may fancy the number on these long canes. The Loganberry, too, is most prolific, producing large fruit like a Mulberry, of a rich, luscious flavour, but at the same time slightly acid. They make the finest of tarts and preserve, and are also much liked for dessert. This plant is a hybrid between a fine American Blackberry and a Raspberry, and looks like a very large and long Raspberry, only that it is darker in tint when quite ripe. We mulch our plants each spring in March (or April for the Wineberry) with cow-manure, for they are hungry things, and need a moist, cool surface in summer when their fruits are swelling, if the crop is to be a fine one. In a very dry time they are drenched with buckets of water once or twice a week, for they need much moisture, and never is the spade allowed to come near their roots. It is not everyone who realises that fruit crops of all kinds (and especially those produced by the Rubi) depend largely on the state of the network of surface roots which the plants form for many feet around the stem; I have sometimes seen in a garden a perfect forest of suckers between the rows of Raspberry canes, and these are thrown up by the severed or injured rootlets, which are too often cut and destroyed by the spade of the gardener, ruining the crop, of course, except in suckers, of which there are then more than enough. Another foolish plan is to pile the manure round the stem of the plant, instead of spreading it between the rows, where, of course, the active, hungry surface-roots are craving for food, which is not wanted close to the collar of the plant at all. Roses (which are nearly allied to the Rubi) are often cankered and killed by this piece of ignorance, so don't let old John do it any more, even if he laughs at your "new-fangled notions," and especially keep him from putting on manure "to keep them warm" in the winter, for it is pure waste, if nothing more, and results in keeping them many degrees colder at the roots than if they were open to the sunshine, and allowed to dry. Cankered roots too often arise from this cause, for the poor things cannot stand being soaked in filth when they are dormant and have no use for it.

AMARYLLIS (HIPPEASTRUM).

Two bulbs which you should now put in are Tuberoses and Amaryllis hippeastrums, both lovely things, but not too often seen in the ordinary greenhouse. The best variety of Tuberose I find to be the American one, called Excelsior Pearl, a silly sort of name, but a good flower; the African Tuberose is earlier, however, in flowering, and you can't do better than to order a few of each, for succession, the rich scent of the Tuberose being delightful in the conservatory in the summer and autumn months. The bulbs are very cheap, and rather large; they want special management to do well, but, like most things, they are easy enough to grow if you know how to do it. First of all, you must pot them up directly they arrive, as they have a nasty trick of going mouldy at once if you leave them in a paper bag. I was asked by a friend, a short time ago, what was the matter with some bulbs which she had bought and shut up in a tin box for six weeks. Of course, the matter was that they were a useless mass of mildew, which seemed to surprise her greatly. Never keep bulbs out of the soil if you can possibly help it, for they are sure to deteriorate, and quickly become rotten.

Well, pot your Tuberoses each in a 5-in. or 6-in. pot, extra well drained, and only half filled with a compost of good loam, leaf-mould, and a little soot, sand, and charcoal; they won't stand anything like fresh manure under them, though when they have roots they need plenty of rich food, so you should only half cover the bulb (the top of which may be level with the top of the pot) with this compost, leaving the top part of the pot vacant for the rich top-dressings they will have later on. Use the compost fairly moist (but not too wet), and then place the pots on the stage over the hot-water pipes, watering them about once a week (only when they look quite dry) with warm water, until the green shoots appear in the middle of the bulb. Then you must change your tactics. As soon as they have roots, Tuberoses want more water, and so you should increase their supply gradually, until, when the plant is six inches high, it will need watering every day, or even twice a day in hot weather. At the same time you should top-dress the bulbs, giving them an inch or so at a time of rich stuff (old cow-manure, with a little loam, hotbed material, or a mixture of both, with a little soot), until the pot is fairly full, but be sure to leave room for plenty of water and liquid manure. When the plants are growing, keep them on a moist board over the pipes, or on the floor, for dry, hot air at that time brings on an attack of red-spider, which

Gard. Chron., 1874

Obituary.

DIED, at Powis Castle, Welshpool, on the 24th ult., in the 78th year of his age, Mr. GEORGE BROWN, for forty-five years the talented gardener to the late and present Earl of Powis. Mr. Brown was a man full of love for his profession, and in every sense of the word a gardener. He was born at Dalhousie, North Britain, on July 8, 1797. Shortly after his birth, his father removed to Arisaig, on the coast of Inverness-shire, having been appointed forester to Clanronald, on his extensive estates in the Hebrides. Here he spent most of his younger days, and to the last he loved to dwell on the recollections of the time passed amidst the wild and romantic hills and lochs of the Western Highlands. He began his professional career at Dalmeny Park, Edinburgh, from whence he obtained a situation as journeyman in the gardens at Dalhousie Castle; from which place, with a view of gaining a knowledge of the seed trade, he entered the seed warehouse of the Messrs. Dicksons, of Edinburgh. After being with this firm for a short time he formed a determination to visit England, and in the year 1821, in company with his brother Hay, he walked every step of the road from Edinburgh to Chester. He never tired of telling the story of this walk, of which he was very proud, and from which he seems to have derived a vast amount of enjoyment. Arrived in England, his first place (obtained through the Messrs. Dickson, of Chester) was at Brynkinalt, Chirk, the seat of Lord Dungannon; afterwards as gardener at Erbistoke Hall, Ruabon; and thence to the Hon. and Rev. James Douglas, at Broughton, Northamptonshire. Here he remained for four years, having charge, during the long absence of Mr. and Mrs. Douglas, of the whole establishment.

He now desired to obtain a more extensive place, and therefore accepted an appointment to superintend the formation of the great rockery at Sion House, and on the abandonment of that work he entered the nursery of Messrs. Whitley & Milne, Fulham (now Messrs. Osborn & Sons), where he remained for some months, when, on the recommendation of Mr. Milne and Lord Douglas, he was engaged by the late Earl Powis (at that time Lord Clive), as his head gardener at Powis Castle, entering on his duties there in May, 1829. The writer had the privilege to serve him as foreman for a considerable time, and can speak from experience of the great energy, devotedness, skill, and conscientiousness wherewith he served his employer. The one distinguishing trait in Mr. Brown's character was his utter disregard of self—selfishness was not in his vocabulary; if duty called he obeyed, at whatever cost or sacrifice to himself. Though he was one of the best gardeners of the day, his naturally retiring, unassuming disposition prevented him from being known to fame; but his memory is enshrined in the hearts of many he has benefited, and amongst them are not a few gardeners.

He leaves a widow and two sons, the elder of whom is a surgeon in extensive practice at Tredegar, South Wales, while the younger has for a considerable time assisted his father at Powis Castle. He was carried to his grave at Christchurch, Welshpool, on the 29th ult., by his old workmen, some of whom had been employed by his predecessor at Powis Castle, Lymore Park and Llymystyn Hall, of which places also he had charge. *W.*

remember, for example, the time when Richardia Elliottiana, which was introduced in 1896, could not be obtained for less than a guinea, while R. Pentlandi could be obtained for fifteen shillings; yet I see that the latter is still catalogued at the same price, while the former has dropped to half-a-crown. Both need much the same treatment—rather a higher temperature than the common R. africana—and the one is not more difficult to propagate than the other. Then, why this difference in the price? If it is a matter of demand, I should call R. Elliottiana the more beautiful of the two.

February 29th.—It would be difficult to say why flowers look better with their own foliage, unless it be that the mind naturally associates certain lines with certain flowers, but it is easy to see that this is the case. Even Carnations are most beautiful when arranged with their own leaves, stiff as the latter might seem to be. With a very little help they fall naturally into graceful curves, if they are allowed sufficient space, and their long stalks give them an advantage over many other flowers.

H. C. Davidson.

The Gardens of the Marquis of Lansdowne, at Bowood, Wiltshire.

INTERVIEW WITH MR. GEORGE BROWN.

As may be imagined, it is no easy matter to exhaust interest in the gardens at Bowood, and at the conclusion of a short visit, which, by the courtesy of Lord Lansdowne, I paid to them on a bright day in February, I told Mr. Brown, the head gardener, who accompanied me round, that I required a whole day to grasp their charm. It is not only that they are very extensive, covering some seventy acres, apart from the great lake, whose area is sixty acres: they have been so planned, and so maintained, that they demand unrelaxing attention. The surroundings of Bowood enjoy many natural advantages, not the least being the numerous undulations.

These at once attracted my attention when we entered the garden at a point not far from the portico of a Greek temple, amid the trees of a peninsula at the head of the lake. From here we proceeded along grassy slopes, pausing for a while at the Cascade, to which Britton gives pre-eminence in his famous work, "The Beauties of Wiltshire." From this point a glimpse of the stately historic mansion is obtained, and in this locality are many noble specimens of trees, including Scotch Firs, of which Lord Lansdowne is so fond that, if the question of removal has to be settled, he always requests that the Scotch Firs may remain. But we delayed our talk about trees until the Pinetum was inspected, and discussed the shrubs, which, as we approached the house, came into prominence.

The Shrubberies.

"A number of shrubberies have been added," said Mr. Brown, "during the last twelve years."

"I conclude that the soil is congenial?"

"Yes, it is sandy loam, and all the shrubs do well in it. We suffer from a prolonged drought, but not from excess of rain. Even Rhododendrons, without peat, flourish planted in loam and leaf-soil. In fact, the theory of planting in peat is out of date."

"You have a nice collection of Aucubas in the shrubbery under the walled garden?"

"Yes, they look pretty when they are adorned by the scarlet berries. There is only one male plant, A. japonica maculata, amongst the females. The clumps of shrubs go round three sides of the walled garden. But we shall enter the latter at another point."

"Do you employ any special measures in order to keep up such a thriving collection of shrubs?"

"The ground is carefully prepared for planting. I use a great quantity of leaves, and trench them, with the result that the sandy soil remains cool and moist. But now you shall see the garden attached to the small house."

Lady Lansdowne's Garden.

"May I ask what is meant by 'the small house'?"

"It is the term applied to the suites of rooms occupied by Lord and Lady Lansdowne and the family; and the garden with the sundial in the centre is known as 'Lady Lansdowne's garden.' It was laid out nine or ten years ago, and, as you will note, climbers on the walls are very conspicuous."

"There are some also on the verandah of the house."

"The latter are the white Jasminum, the ordinary and the Japanese Honeysuckles. Along the walls are such varieties as Viburnum macrocephalum, Euonymus Langleyensis, Choisya ternata, Wistaria sinensis, Euonymus Ingramii, Azara microphylla, Aristolochia sipho, Lonicera flexuosa, Ceanothus Veitchiana, and Vitis Coignetiæ."

"How many beds are there in this garden?"

"Sixteen. For spring, they are planted chiefly with Wallflowers, of which the best are Sutton's Purple Queen, Sutton's Fairy Queen, and Sutton's Eastern Queen. The colours of these are excellent. We add the ordinary yellow and dark brown bedders. The long border, consisting wholly of Wallflowers, is made up of dark brown and yellow bedders, with a new white variety, called Ivy White, which I am using for the first time this year. The remainder of the beds are made up with Silenes, Daisies, Primroses, and Tulips. For summer bedding, Geraniums, Verbenas, and Lobelias are chiefly used."

The chief rooms of the "small house" overlook the terraces and gardens on the east side, and here is a collection of Alpines.

"You seem to go in for certain Alpines in number, rather than for numerous varieties," I remarked.

"That is my policy, generally. I am not a believer in a vast number of varieties, but when I get something which I consider good, I grow it in quantity. The principal Alpines are Saxifrages, Sempervivums, Thymes, and Campanulas. The climbers over the house include two Magnolia grandiflora, Ampelopsis Veitchii (a very old plant), and Akebia quinata. In a south corner you will observe that Tropæolum speciosum is doing well. Many people say that it will only flourish when it has a northern aspect. The Roses on the wall are Niphetos, Gloire de Dijon, and Devoniensis."

"Is not the design of bedding near the guest house rather unique?"

"Yes, I think it is. By the way, the older house is called, for convenience, the 'large house.' This bedding, which is on Italian lines, consists, in the centre, of Wallflowers and Tulips, edged by Myosotis, with a standard Rose (Ayrshire) in the centre. The eight beds are made up as follows:—Four corner beds of Silene compacta, with scarlet Tulips (Duchess de Parma), Lychnis viscara grandiflora, and yellow Primroses; and four side beds of white Arabis and Silenes. In summer we always have scarlet flowers in the outside bed, such as Geraniums (West Brighton Gem), edged with Pyrethrum Golden Ball. In the four nooks will be suitable Geraniums, with a nice border of Cerastiums. In the centre, Geranium Paul Crampel is used, the border being composed of Geranium Mrs. Parker. With the grass between the beds, the colour, while brilliant, is sufficiently toned down. We fill the vases on the terrace, facing the boathouse, with Geranium Paul Crampel."

The Orangery at Bowood.

Climbers and Roses.

"Climbers, I notice, are numerous on the guest house?"

"Both Lord and Lady Lansdowne are fond of climbers. In addition to some already mentioned, these include Wistaria multijuga, and Rose Gloire de Dijon. From here you get a good view of the heronry, and the herons on the tops of the trees."

"The entrance faces south?"

"Yes, opposite the deer park. There are more climbers, in which, perhaps, you are more interested for the moment than in the famous Doric portico. They include the white Banksian Rose, Myrtles, and Magnolias. Along the wall, on the lower terrace, are Roses, entirely of the Tea section, the varieties that do well being Safrano, The Bride, Comtesse de Nadaillac, Lord Salisbury, Maman Cochet, Francesa Kruger, Clara Watson, Madame de Watteville, Isabella Sprunt, Rainbow, The Gem, Madame Falcot, Ethel Brownlow, Kaiserin Augusta Victoria, Amazon, L'Innocence, Souvenir de Therese Levet, Madame Bravy, and Marie van Houtte. On the wall the Fabiana imbricata resembles a Heath in flower. Standard Roses are in the centre of the beds of the lower terrace."

"And the rest of the bedding in the lower terrace?"

"Four of the beds have Geranium Mrs. Parker in the centre, with blue Lobelias in two, and Geranium West Brighton Gem in the other two. Then there are five beds, the central one containing Geranium Paul Crampel; four are composed of Geranium Madame Crousse, and four of white Verbena. In this part of the terrace there are sixteen Irish Yews at intervals. These beds and those on the higher terrace are not planted with spring flowers.

"As to the bedding on the higher terrace," continued Mr. Brown, "it is made to correspond on each side of the marble fountain. There is one bed of scarlet Geraniums, two of Ageratums, two of golden Calceolarias, two of Geranium Henry Jacoby, edged with Dolly Varden, two of white Verbenas, edged with Iresine, four of Geraniums, and four of the old Lobelia West Brighton Gem. At the foot of the eight Irish Yews amid the beds, Tropæolum Vesuvius has a very good effect, the bright scarlet and the green showing up well with the blue, pink, and white all the way round. Of course, the object in view is to get an attractive scheme of colour. Now we come to the Orangery. It is not usually furnished, but on special occasions, as, for instance, when the King visited Bowood, it was profusely decorated."

Crossing the stable-yard, in which is a magnificent plant of Ampelopsis Veitchii covering a large part of the stable, we arrived in the Green Court, a small, enclosed garden, with paved walks, a lawn, a fountain and fish-pond in the centre, and numerous creepers on the walls of the surrounding buildings.

"In the summer," said Mr. Brown, "the Green Court is furnished with Oranges, Myrtles, and Sweet Bays in tubs, and Geraniums in large basket vases; the beds are filled with Begonias, and the pond with Nymphæas. But now I think we ought to make our way to the walled-in garden."

The Cascade at Bowood.

Sundial in the Gardens of Bowood.

Previous to this, however, having passed some more shrubberies planted in the margin with Pæonies and Iris, and containing clumps of Spiræas and China Roses, we looked into the stoke-hole, which holds forty tons of coal, and supplies heat for the whole of the glasshouses. Also we visited the ornamental and well-ranged little bothy, containing six bed-rooms, mess-room, and other excellent accommodation for six of the young gardeners who are included on the staff of twenty. Moreover, here, as elsewhere, climbers have been freely planted, and growing on the walls of the bothy are Jasminum, Forsythia suspensa, Escallonias, Ceanothus, Azaras, Honeysuckle, Choisya ternata, and Ampelopsis Veitchii. The walled-in kitchen garden is divided into four quarters, one portion consistng entirely of glasshouses, and the other three of fruit and vegetables. The arrangement is most convenient, and materially tends to economise labour. In the first quarter, a number of cordon Pears are on the east aspect of the west wall, and on the south wall are Peaches, Apricots, and Cherries."

"What are the names of the Peaches?" I enquired.

"Darwin, Dr. Hogg, Early Rivers, Alexandra, Dagmar, Noblesse. The Nectarines are Lord Napier, Pineapple, Humboldt, Spencer, and Rivers' Early Orange. The Cherries include such as Early Black, Black Tartarian, Governor Wood, Early Rivers, May Duke, Belle d'Orleans, and Bedford's Prolific. We are just trying Powell's Late Apricot, but rely chiefly upon Moor Park."

"I see you go in largely for Strawberries."

"The varieties are Royal Sovereign (which we also force), Vicomtesse H. de Thury, Leader, Givon's Late Prolific, and Elton Pine."

"You have not given me the names of any Pears."

"The best of these are Gansel's Bergamotte, Bergamotte Esperen, Beurré Bachelier, Beurré Bosc, Beurré d'Amanlis, Beurré Diel, Beurré Hardy, Pitmaston Duchess, Beurré d'Arembergs, Williams's Bon Chrétien, Doyenné du Comice, Glou Morceau, Josephine de Malines, Marie Louise, Marie Louise d'Uccle, Passe Colmar, and Olivier de Serres. For some years we were troubled with the Pear gnat, and, after trying many other remedies, finally got rid of it by picking off early in June the infested fruit."

Apples on the Bush.

"How do you grow Apples chiefly?"

"We grow them entirely on the bush. They are the most easy to pick, and the crops never fail. Our bushes were planted twelve years ago, and we have never been a year without fruit. I root-prune frequently—half of the trees

one year, and the other half the following year The kitchen varieties grown are Blenheim Orange, Bramley's Seedling, Chelmsford Wonder, Cox's Pomona, Dumelow's Seedling, Golden Noble, Lord Grosvenor, Peasgood's Nonsuch, The Queen, and Lane's Prince Albert. The best dessert varieties are Barnack Beauty, Cox's Orange Pippin, Duke of Devonshire, Allington Pippin, American Mother, Golden Reinette, Kerry Pippin, King of the Pippins, and Mrs. Gladstone."

"What about Plums?"

"We grow Early Prolific, Dennis'on's Superb, Jefferson, Kirkes', Belgium Purple, Diamond, Washington, Victoria, and Greengages in variety. Plums do well on both west and north walls, and Morella Cherries on the north. I have also seen Morella Cherries thrive with an east aspect. Underneath the latter are Raspberries, all of one variety, Superlative. Of course, we grow Currants and Gooseberries. Before we dismiss the walls, I may add that, in addition to the Rose border, containing Hybrid Perpetuals, there are a number of climbing Roses on the walls."

"Do you make specialities of any vegetab'es?"

The Gardeners' Bothy at Bowood.

"A very large batch of Broccoli is grown, which are protected from the frost by heeling them over. The varieties are Veitch's Maincrop, Chelsea Favourite, and Self-protecting. My stand-by in Cabbages for the winter are Sutton's Flower of Spring and Wheeler's Imperial. Asparagus is a big item. We grow it on the French system. At the end of this quarter, in the borders north and south, are grown herbaceous plants and annuals in clumps."

Herbaceous Plants in Clumps.

"What are the dimensions of the borders?"

"They are two hundred yards long on either side, and we only have tall-growing varieties, which are also largely chosen for colour. They include Sweet Peas (about twenty-four varieties), Pentstemons, Salvias (scarlet and blue), Phlox in variety, Chrysanthemum maximum (William Robinson), Lavatera (rosea and alba), Salpiglossis, Montbretias, Campanula pyramidalis, Anemone japonica, Incarvilleas, and Sedum siberica. Just at the end of the borders we have a few of Lord Lansdowne's favourite spring Alpines—Aubrietias, Arabis, Arenarias, and Alpine Phlox. The Violets in frames are Marie Louise, Belle de Chatenay, and Princess of Wales."

The Vineries.

"Your range of houses is very handsome."

"We had to level all the ground when they were erected six years ago, and the appearance of them is, I think, improved by the plots of grass between them. The fruit range consists of the Vineries, an early, mid-season, and late. In the early house are Hamburghs, Foster's Seedling, and Madresfield Court. In the mid-season house, Muscats of Alexandria, and Mrs. Pince Muscat; and late house, Lady Downe's and Alicante. The Fig house contains Brown Turkey, White Marseilles, and a few varieties in pots. Strawberries do well on the shelves right along the range. You may like to note that the wires in the Vineries are twenty-two inches from the glass, which admits of a free circulation of air between the leaves and the glass."

"You also have Roses in pots here?"

"Just a few of Dorothy Perkins, and three dozen pots of Streptosolen, which we often use in a single day at a dinner-party. The Peach house has only two varieties, Lord Napier and Royal George. On the border outside the fruit range, in lines, we grow scarlet Salvias, Calceolarias amplexicaulis, Rehmannia angulata, Calceolaria Golden Gem, Geranium Madame Crousse, blue Lobelias, and Pyrethrums."

A Begonia House.

"What are the principal contents of the stove?"

"We do not go in much for foliage plants, but Crotons, Pandanus, and Gardenias are grown, with Stephanotis on the roof. In the greenhouse are Cyclamen (Sutton's strain), Cineraria stellata, Primulas (kewensis, obconica, and sinensis), and Arums, which we flower in batches. Another house is devoted entirely to Begonias, with President Carnot grown on the roof, the flowers, as they ought to be, drooping down. Gloire de Lorraine, Gloire de Sceaux, and Turnford Hall are also grown, and in this house we have Lilies of the Valley. We have been cutting Daffodils for some weeks. I am rather fond of Jacobinia; we grow both coccinea and Chrysostephana. Plumbago rosea is also grown, and Moschosma riparium."

The Carnation Houses.

"What is the name of the little purple flower?"

"Ruellia macrantha. We grow a number in pots, and it requires much the same treatment as Poinsettias. In the propagating house there are a few Orchids only, and Imantophyllums are just coming on. The house next is devoted to Melons, the varieties being Royal Favourite, Hero of Lockinge, and Sutton's A1."

"You have two Carnation-houses?"

"Yes; in one we grow Trees and Malmaisons together, preferring white in the Tree varieties. The best of these are Mrs. L. Robinson, Queen Louise, Norway, and Governor Woolcot. We also grow La Penilé (rose-pink), Enchantress, and Flamingo. Of Malmaisons, we grow Princess of Wales, Lady Grimstone, Florizel, Mrs. Wilson, Nell Gwynne (one of the best whites), and Princess of Wales. The other house is devoted to the variety Winter Cheer, and we cut flowers all the year round—about four dozen from each plant—the number of plants being about three hundred. The blooms just now are rather small, but later they will be much larger. It is a most useful colour for decorative purposes."

The Famous Trees in the Pinetum.

Then, having noticed a number of useful pits, all made on the principle of dropping gradually, according to the state of the weather, we strolled across to the Pinetum, which contains a typical collection of coniferous trees, many of them of great beauty.

"You might," I said, "give me the names of some of the notable specimens."

"There are several fine examples of the Evergreen Oak in the pleasure grounds. The specimen of Pinus insignis (radiata) is one of the finest trees in England. Other examples of Pinus are Jeffreyi, cembra, flexilis, and strobus. You noticed, in other parts of the pleasure grounds, a number of small specimens of Lawsoniana Cupressus. We make a number of these from pyramids growing up amongst the shrubs. The other Cupressus represented is nootkatensis. The Cedars are atlantica, C. atlantica glauca, Libani, deodara; the Piceas, orientalis, Sitchensis, and Smithiana; the Abies, grandis, nobilis, Albertiana, and Douglasii; the Thujas, dolabrata and gigantea. We have also notable specimens of the Incense Cedar (Libocedrus), Sequoia, Sempervirens, Wellingtonia gigantea, Hornbeam, and Liriodendron tulipifera. The extent of the Pinetum is about seven acres."

"How long have you been at Bowood, Mr. Brown?"

"I have been here twelve years, but I have been thirty-two years in the service of the family. I came from Scotland to Wiltshire, having previously been at Tullyallen Castle, on the Forth. Earlier in life I spent some time in the gardens of the Duke of Buccleuch at Drumlanrig Castle, and I was previously in England at Linton Park, Maidstone."

Alfred Wilcox.

Miss Clibran is the name of another of the hybrid race of Begonias obtained by crossing one of the tuberous kinds with B. Socotrana. All these are winter-flowering, and of great value at this season. The one now referred to is of a vigorous habit of growth, with handsome foliage, and a profusion of rich pink, double blossoms. It was shown by Messrs. Clibran and Son, during the past season, and received an award of merit.

The beautiful scarlet-flowered Eucalyptus ficifolia has flowered recently in the garden of Mr. W. North Row, of Tiverton, Devon. It is a very handsome plant, with fine evergreen leaves about six inches long, and large heads of fluffy, Myrtle-like blossoms, of the richest scarlet. It is not a large-growing species, usually attaining a height of fifteen or eighteen feet. The plant referred to was planted out under glass. This fine Eucalyptus had bloomed several times previously at Letham Grove, Arbroath, N.B.

THE GARDENS AT CASTLE HILL, ENGLEFIELD GREEN.

Interview with Mr. H. H. Brown.

IMPORTANT additions have recently been made to the gardens at Castle Hill, Englefield Green. Visiting them, by the courtesy of Mr. W. G. Raphael, in the middle of July, I was greatly impressed by the admirable manner in which they have been conceived and carried out. But on my arrival, the head gardener, Mr. H. H. Brown, first called my attention to some noble specimens of Cedars, Beeches, and Scottish Firs at the east front entrance. In this part of the pleasure grounds there have been no changes. The carriage drive is, in fact, quite plain, and altogether in keeping with the style of the mansion. The latter, as it now is, was only built twenty-five years ago, but the original house dated far back, and care was taken, in erecting its successor, to preserve the characteristic features. Noting, in addition to the fine trees on the east side of the lawn, several in the park outside—including two Cedars of Lebanon sweeping the ground, a Chestnut with a very large pink and white flower, and a striking specimen of Liquidambar—with a ponticum Rhododendron of enormous size, I asked if the creepers on the mansion included anything special.

"Ceanothus fragrans does well," rejoined Mr. Brown, "and the other climbers are Wistaria sinensis, Jasminum, Lonicera, Clematis, and the Virginia Creeper, which colours splendidly. For a white house nothing is better. The servants' quarters, you will observe, are quite concealed by shrubs, with Sedum spectabile atro-purpureum in front. The screen of Ivy at the side, with Berberis, and a few other flowering shrubs, was put up in order that the main lawn might not be visible at the entrance. On the main lawn is one of the new features. I mean the Rose garden."

CASTLE HILL, ENGLEFIELD GREEN.

Roses to Colour.

"What did it take the place of?"

"Carpet bedding. There is one variety in each bed, with two centre beds of Liberty. The centre beds are crimson, and the outside colours in the six other beds are Caroline Testout, Madame Ravary, Frau Karl Druschki, Kaiserin Augusta Victoria, Madame Abel Chatenay, and Mdlle. Jeanne Philippe. The last is a very free-flowering variety, with foliage of a beautiful tint. One advantage of the Roses in this position is that their scent penetrates to the rooms of the house."

"Did you make up the soil?"

"Entirely. The natural soil is very poor, and we need to enrich it constantly. However, since these Roses were planted in the beds, I have not lost one, and this is the third year of blooming."

Tree Ferns for Decoration.

"On the west side of the mansion," continued Mr. Brown, "are hanging baskets, containing Ivy-leaved Geraniums (Souvenir de Charles Turner), and Eulalia gracilis."

"How long have you had the fine show of Tree Ferns in the balcony?"
